plied by the grammar. So examples must precede abstract rules, and in all cases the matter the form. The proper plan, then, is to present pupils with a cyclopædia, as it were, of things to be taught, which is to be gradually rendered more and more extensive; and every language, art, and science is first to be learned according to its simplest rudiments, and then more fully by means of rules and examples, all exceptions being systematically adduced. The last sentence expresses the object which Comenius proposed to himself in all his works; an object which, he says unreasonably enough, cannot be obtained by reading the classics, since they do not treat of all subjects. His own works were, in fact, Latin phrase-books, containing, in encyclopædic arrangement, the terms and principles of the various branches of knowledge as then understood. The first of these in the order of publication was the 'Januæ Reseratae'; but he afterwards produced an amended edition of it, making it the second of his course. This course commenced with the 'Januæ Reseratae Vestibulum,' which was intended as a class-book for the lowest class of the school organized by Comenius at Patah in Transylvania. In the 'Vestibulum,' to use his own quaint words, the foundations of language are laid down; in the 'Januæ' the essential parts of the building are erected; in the 'Atrium' the ornamental portions are added; and the scholar may then enter the palace of authors—that is, betake himself to the authors themselves. The 'Vestibulum' commences with the consideration of things individually, substantives alone being introduced—as, for instance, 'the elements are, fire, air, water, earth. In the sky are the heavenly bodies, from which proceed heat and cold. The heavenly bodies are, the sun, moon, and stars. In the sun is light; without light there is darkness,' &c.; and so on through trees, animals, man and his occupations. We then come to the qualities of things, and are presented with adjectives. 'The sun is bright or obscure; the moon full moon or half moon,' &c. We then go on to pronouns and verbs—as 'everything can be or do something. The action of God is to create, to sustain,' &c. Then follow the various actions of man by the members of his body, his mind, and so forth. In the same manner the author pursues his way through all the various parts of speech. The 'Vestibulum' was accompanied by a rudimentary grammar, and a glossary of the whole of the words contained in the text.

The 'Januæ,' in the first edition, was a phrase-book, consisting of one thousand Latin sentences on all subjects, beginning with the creation of the world, and concluding with a chapter on angels. The second 'Januæ' was a more complicated work, consisting of three parts. Of these, the first is an etymological lexicon, arranged according to the roots, so as still to keep up the connection between words and facts, in the following manner:—'*Fin*-is-it omnia, et ostendit rei-em; *h.e.*, alem causam. De-ibus agrorum saepe sunt lites, quas-itor de-it.' That is, *Finis*, the end; *finit*, finishes all things, and shows *finem*, the end of the thing; *h.e.*, *finale*, the final cause. With regard to *finibus*, the boundaries of fields, there are often disputes, which *finitor*, the surveyor, *definit*, defines. In this way the pupil goes over about 2500 roots, together with the words derived from and compounded with them, and the rules of derivation and composition are then given. This is followed by a grammar; and lastly by the text, which is the same as that of the 'Januæ' in the first edition, though much enlarged.

The 'Atrium' also consists of three parts, beginning with grammar, which Comenius defines as the art of speaking elegantly; and the treatise relates, in fact, rather to what is generally styled rhetoric, than to strict grammar. This is followed by the text and lexicon. These three works were intended to be class-books of the three lowest classes in the Latin school, after completing which, the pupils were to betake themselves to the reading of the classics, and a more extended course of study.

Besides these works, which we have subjected to special consideration, as containing a regular course of school-instruction, Comenius was the author of many and elaborate treatises, all tending to the development of his one great idea—a system of pansophistic, or universal education. Of all his productions, however, the 'Orbis Pictus,' that which he perhaps considered, on its philosophical merits, of least value, is the one by which his name is best and most advantageously known. It is similar in its general method to the 'Januæ,' but with this most important addition, that it is profusely adorned with pictures illustrative of the subjects treated. Comenius had long felt that the want of pictures was a serious defect in his books. His principle being, that instruction must proceed on the basis of actual practice and personal appreciation, it followed that where this could not be obtained, the want could only be supplied by visible representations. Comenius saw that the teaching realities by a series of barren descriptions, devoid of that which could make them best appreciable by his pupils, was little better than the verbal realism which he himself decried. So strong was his feeling on this subject, that he had made every exertion to get illustrations for his previous works; but in vain; nor was it without great trouble, and much loss of time, that he succeeded in supplying this desideratum in the 'Orbis Pictus.' The realisation of Comenius's great principle, that instruction in things must go hand in hand with instruction in words—that the knowledge of words by themselves is vain—was only promised in the 'Januæ'; in the 'Orbis Pictus' that promise was fulfilled; and how admirably the work was fitted for its purpose, may be inferred from the popularity enjoyed by it from its first appearance in 1657 up to the present day. The 'Orbis Pictus' has been translated into several languages; and with many alterations, often no amendments, on the quaint force of the original, is still a favourite child's book in Germany.

It is unnecessary to enter at length on the many points on which there is a striking similarity between the principles of Ratich and Comenius: the slightest examination will show how close was the agreement between them, both in general views and on special points; in none more than on the inexpediency of harshness, and the advantages of rendering instruction agreeable to the pupils. There was this additional similarity between them, that the principal error into which Comenius fell was occasioned by his carrying his own principles to excess. We have seen that whilst altogether averse to the neglect of the mother tongue, he insisted on the most thorough study of Latin. His object in this seems to have been a fantastic idea that Latin might be made the universal language of the world; but be this as it may, the rules which he lays down, as those on which language is to be studied, are lost sight of in his Latin phrase-books. 'Latin,' says he, 'must be thoroughly mastered. By which, however, I do not mean that every word of the language must be known. You may understand Cicero thoroughly, and yet not know the technical expressions of handicraftsmen. Why not? Because you have not visited their workshops. It is not to be expected that any one should trouble himself to learn those terms in another which he is unacquainted with in his own tongue. The meaning, therefore, of a thorough mastery of a language in its fullest extent, is to be taken according to the circumstances and necessity of each student of it. All must consequently learn the language, so far as common to all who speak it; but the physician alone need learn the technical terms of medicine, the divine the theological.' But why, then, does he object to the classics 'that they do not treat of all subjects?' If they contain all that is requisite for learning the language, so far as common to all who speak it, is not this sufficient? Nay, why does not Comenius remain true to the correct principle just laid down by him in his own books? They are crowded with technical expressions and phrases relating solely

to particular trades and occupations, collected with incredible trouble, but totally useless. Latin they are not, many of them being his own composition, and such that, in the general case, the better the Latin scholar, the more they would puzzle him. In this way near one-half of the 'Orbis Pictus,' so far as Latin is concerned, is useless. How, then, did Comenius fall into this error? Simply by a too literal carrying out of his principle of parallelism between things and words. The 'Orbis Pictus' was to embrace the universal world of reality, and accordingly the verbal explanations of the pictures must be equally universal. But why should he embrace the universal world at all? In attempting to force upon the memories of his pupils—for it could be nothing else—a mass of undigested minutiae relating to every art and science in existence, he was rejecting the principle recognised by him in the study of language. Was he not liable to the same objection as that urged by him against the former system of instruction, that it attempted to plant trees instead of sowing seeds? Pansophistic education, properly so called, consists not in the teaching of everything, but in laying the foundation for self-instruction in everything; and Comenius fell into the same error, though in a smaller degree, as Ratick.

Allowing all due weight, however, to this failure on the part of Comenius in carrying his theory into practice, the cause of education is still greatly indebted to him. It is not merely that in his works may be found the original idea of the elementary school-books of Pestalozzi and Basedow, as well as of almost every one of those improved treatises for facilitating instruction which issue daily from the press, but that he imparted an altogether new view of education to thinking men in general. A witty author of the present day sums up the instruction to be gained at a modern public school thus:—'When I left Eton, I could make fifty Latin verses in half an hour; I could construe *without* an English translation all the easy Latin authors, and many of the difficult ones *with it*; I could read Greek fluently, and even translate it through the medium of a Latin version at the bottom of the page. I was thought exceedingly clever, for I had been only eight years in acquiring all this fund of information. As I was never taught a syllable of English during this period, and as one learns nothing now-a-days by inspiration, so of everything which relates to English literature, English laws, and English history, you have every right to suppose that I was, at the age of eighteen, in the profoundest ignorance.' It was of such education as this that Comenius first practically showed the futility; and it was to obviate such miserable waste of time as that described above, that he composed his pansophistic phrase-books. Following in the footsteps of his master, he did that for education which Bacon had done with regard to philosophy in general. At the present day, it is almost impossible to realise the difficulties which lay in his way, or the vast improvement offered by these little works, crude and meagre as they were, on the previous means of tuition. In our present superfluity of illustration, both pictorially and otherwise, we smile at the almost unintelligible pictures of the original 'Orbis Pictus,' and wonder at the anxiety which its author expresses to obtain such blind guides for his pupils; and yet there can be no doubt that the appearance of this book forms in itself an era in the history of education. Let any one—to take the simplest case—but imagine for a moment the difference of the impression which would be made on a youthful mind by a picture, however rude, of any animal, and that likely to be produced by the most detailed description, and he will at once see the importance of the Baconian principle, imparted by Comenius into education, that our own personal experience is the true medium of instruction. How great was the improvement effected, even in his own day, by his exertions, is proved by the testimony of his contemporaries. Adolphus Tasse, professor of mathematics at Hamburg, writes:—'In every country in Europe the study of a

better method of instruction is pursued with enthusiasm. Had Comenius done nothing more than kindle this desire in the public mind, he would have done enough.'

A DAY IN THE GOVERNOR'S HOUSE.

'HENCEFORTH,' says a recent writer, speaking of the East, 'a lovely and stately vision is ever present to my mind and my heart. . . . Mountains, valleys, and oceans are now between us, but mental portraiture can never be obliterated.' To this I yield a cordial assent; for in far more vivid colours than any other scenes of my life are those of a short residence in India painted on my memory; Daguerreotypes there perhaps by that glorious sun, the remembrance of which makes the brightest day of our northern summer appear pale and faded. My Eastern home was the governor's house at Parell, a noble building, originally a Portuguese convent, surrounded by the nearest likeness to an English park that ever I saw in India. The chapel of former times has been made a vast dining-room; the chancel a billiard-room—a sad desecration, to which time, however, has reconciled the inmates of the dwelling. Above this transformed church a suite of drawing-rooms has been built, opening into lofty stone corridors hung with the painted lamps of China. The sleeping apartments are also in suites, and to each is attached a sitting-room and baths. The jalousied windows of our chambers commanded a fine view of the Kandalla Hills; and immediately beneath them lay the garden, which, though rather quaint and formal, was very pretty. In the centre path, opposite the dining-room, stood that loveliest of ornaments, a fountain, having on each side of it one of those tall trees, the berries of which are natural castanets, that ring most musically in every breeze, bringing to remembrance the singing-tree of the 'Arabian Nights.' From the branches of these leafy musicians a magnificent creeper hung in a festoon over the fountain, and the sparkling water, playing high above it, left in its descent many a liquid opal on its large white bell-shaped flowers. Beyond these opened a glimpse of the tank, shaded by lofty palms.

A day spent in this Eastern dwelling was so different in its routine, its business, and its pleasures, from one passed in busy England, that a sketch of the 'sayings and doings' of four-and-twenty hours there may not be void of interest to those who know little of the detail of Oriental life; in which 'the golden hours' glide by in such a sweet monotony, that a picture of one day would image forth nearly all the year's.

Very regularly, at five o'clock every morning, the crows awake, and by their discordant matins effectually banish sleep; a very unromantic ending to pleasant dreams; but the freshness of the morning air stealing through the jalousies atones for the ungracious noise. Those of our household who rode or walked early then prepared for their excursion; for myself, I preferred the 'between sleeping and waking' of the coolest hour of the day, except on a few occasions, when I was tempted to sketch by starlight. Gradually this half sleep is disturbed by the low plashing of water, as the bearers commence filling the bath; an employment of some duration, as it is effected by bringing the water in jars called *chatties* up several flights of stairs. The bath is undoubtedly the greatest luxury of the East: one lingers in it as long as possible, for the toilet which follows is in the heat a weary task; though, on returning to the sleeping-room, the refreshment of a cup of tea and biscuit is always presented to the bather. On issuing from our chamber, we were greeted in the long corridor beyond it by the assembled servants, who had passed the night there—the head-servants, the seapoy, the bearers, and a gardener; the last of whom held on a salver his fragrant morning offering of a bouquet of red roses, tied round a stick to preserve them from the warmth of the hand, and bathed in rose-water to increase their freshness. This pretty

gift is offered with a profound salaam, and a grace which is apparently the inheritance of the children of the East.

The corridor we traversed was a gallery open on one side with jalousies; on the opposite wall hung some pictures, on which, from the train of thought they awoke, I could never gaze without feeling touched. They were views of Scotland, and a faded likeness of Niel Gow, memorials of the patriotic feelings of a former and Scotch governor. But the climate of India is unfriendly to the arts. The monsoon is the unsparing enemy of pianos and pictures; and the views of the Falls of the Clyde and Melrose Abbey have become, under its influence, very ghostly and faded images of the distant scenes they represent. Nine o'clock brought breakfast, a meal consisting of fish (of which the pomfret is perhaps the best), curry, mutton-chops, grilled chickens, eggs, guava-jelly, marmalade, limes, oranges, mangoes, bananas, tea, &c. At its close the servants bring finger-glasses, in which are fragrant lime leaves, a delightful addition to the cool water they contain. Over the breakfast table a punkah is suspended. As we dispersed to our several morning occupations, we saw a number of horses on the lawn in front, led about by the grooms, and adorned with strings of the calamata-flower. On inquiry, we found that the day was the 'festival of horses,' and that their owners were expected to give a *busheesh* to the animals' attendants, part of which was devoted to religious purposes—if such a term can be applied to a heathen sacrifice—and the rest to a grand entertainment among themselves.

The governor had retired to his office, whither he was speedily followed by a royal suppliant, whose approach excited no small amusement. We were standing in the drawing-room, when from the grand staircase rose the sudden apparition of a couple of large blankets held sideways by six bearers, so as to form a sort of passage. Within this extraordinary veil walked the Eastern princess, her tiny and jewelled ankles and naked feet being visible below it. She did not deign to take any notice of us; but without appearing to observe any one in the room, the procession moved slowly and solemnly past us, and ascended to the Burra Sahib's apartment. Here, as we afterwards learned, she stepped from her screen, and after a speech to the governor, informing him that she considered him as a father, and his private secretary as her brother, she lifted her veil, and displayed the features of an elderly Hindoo woman, which are almost invariably plain even to ugliness. The request she came to proffer was, that she might marry her minister; but for certain political reasons, the Burra Sahib had the cruelty to refuse her; and after trying all kinds of eloquence unavailingly, the disappointed lady returned behind her blanket screen, and departed in the same singular and solemn state in which she had appeared. As strange, or even a stranger guest, occupied the remainder of the governor's morning. This was a chief whose mother had vowed before his birth that if Siva granted her a certain prayer, her child, when he had attained a proper age, should creep on his hands and knees to pay his homage to the nearest English ruler. The fated period had now arrived, and the involuntary pilgrim, in obedience to his mother's vow, had crawled nearly seven hundred miles, taking many weary days or nights for the journey, and gained Parell, his hands and knees torn and wounded by his terrible toil. I missed seeing him, and regretted the circumstance much, as such unselfish performance of duty gave him a strong hold on our interest.

Tiffin, or luncheon, was ready at half-past two, and in the profusion and variety of the viands, greatly surpassed the breakfast. The attendants, who wait behind each person's chair, are Parsees—the ancient fire-worshippers, or Ghebers of Persia, who fled from Mohammedan persecution to Bombay, and have there risen, by their talent and energy, far above the original lords of the land. Tiffin is the time when in general all

the family assemble, and occasional visitors are received. It is, I believe, usual for people to take a siesta after luncheon; in this Eastern custom, however, we did not indulge, but read, played, or worked, as in England, till five o'clock, when the carriage was announced, and we went for our usual drive. The governor's equipage is always attended by a cavalry guard; and on this occasion it was from the Hindoo lancers his escort was chosen; whose slim forms, dark complexions, gay uniform, and the fluttering pennon at the head of their lances, added greatly to the picturesque effect of the runners with gold sticks, and the gaudy gorra-wallahs belonging to the turn-out. Our drive was either to the esplanade outside the fort, where the regimental bands generally played, or (as on the day I am describing) to the Breach—a broken shore facing the setting sun. It was a long and picturesque drive; the road being sometimes bordered by cotton-trees, at others winding through cocoa-nut groves, and at intervals giving to view the round towers in which are the Parsees' sepulchres. Here the hateful vultures have their haunt, and sometimes swoop low, over the carriage, gorged with their foul repast upon the dead; for on a grating upon the top of these towers the Parsee corpse is laid to be devoured by the birds of prey, the bones falling through in time, and thus making way for another body. The Breach is the loveliest spot in Bombay; it is a winding shore, on which the waves of the Indian Ocean lose themselves amongst small and low black rocks. A grove of palm-trees bounds the view towards the south; a Hindoo temple towards the north; and on the landward side of the road, black broken rocks are crowned by the palmyrene, in whose fan-like crown of leaves and branches the bird which, like the Parsee, loves the light, hangs her nest with fireflies. And here, at sunset, a singular and impressive scene presented itself. Our carriage was at first alone, but presently several white-robed Parsees made their appearance, and standing in a line on the shore, offered their worship to the elements in silence. Then a mounted Afghan galloped up, and springing from his steed, spread his prayer-carpet, and commenced the gesticulations of Mohammedan devotion, laying his forehead on the earth. At a little distance, by the wayside, a Hindoo knelt in prayer. His altar was a red stone with a flag over it. The stillness of the hour—for not a sound was audible except the dash of the waves—added greatly to the interest of the scene; and the carriage was kept stationary here for some time, the gorra-wallahs fanning away the insects from the horses till the moon rose, when by its clear pure light we drove homewards.

That evening was to be marked by a display of royal favour to the first descendant of Shem who (since Saladin!) has received the honour of knighthood. After a grand dinner, the governor was to present to Sir Jamsetjee Jeejeebhoy, a Parsee, a gold medal set with diamonds, and bearing her Majesty's likeness, as a present from the Queen. The dinner hour was eight, and the party consisted—what would people think of such a dinner-party at that season?—of eighty persons! It is the duty of the aides-de-camp to arrange the *precedence* properly; and as the Anglo-Indians are somewhat jealous of the *essential* privilege of going down stairs first, the East India Company have given certain rules by which the judgment of the gentlemen of the staff is guided: one point being, that all the civil and military people of the Company's service shall precede the Queen's. A dinner at the government house is a grand affair. The stairs are of black marble, and on each step stand two Hindoo soldiers, each with a drawn sword; flowerpots of choice plants being also placed near them on the same wide step. The dinner is served in the Russian fashion: a splendid display of plate, fruit, and flowers on the table, and a bill of fare on everybody's plate, from which all choose their repast. These bills of fare are curious, from the mode of expression adopted in them by the Parsee writer. After

soup, fish, &c. 'cock-turkey roast' generally heads an endless list of strangely-spelled dishes; 'plumpudding boil' and 'bananas fry' being almost always in the catalogue of the second course. About eighty servants wait on the guests at Parell: in private houses it is usual, we were told, for the guests to bring their own attendants to wait at table.

When the gentlemen came into the drawing-room, preparations were made for the presentation of the medal. A small table, covered with a velvet cushion, was brought to the upper end of the principal drawing-room, and the governor took his place beside it. The Parsee knight was then led forward by the secretaries; he was a tall, fine old man, with a most benevolent expression in his dark eyes and on his lofty brow. He was dressed in the costume of his nation—a flowing and snowy-white robe girt round the waist with a rich scarlet shawl of Cashmere, and on his head the stiff square cap, covered with deep lilac cotton, which was originally a badge of degradation and inferiority imposed on his race by the Hindoos (as the yellow cap was during the middle ages on the Jews), but is now retained by the Ghebers as an honoured memorial of their adherence to their ancient faith. The governor presented him with the golden gift in the Queen's name, informing him that it was a token of her Majesty's esteem, and of her sense of the munificence he had displayed towards her subjects, he having in the course of a year bestowed the immense sum of L.90,000 in charity on Europeans. The Parsee listened with looks of intense gratification; and when the governor ceased speaking, drew a paper from his girdle, and read his answer of thanks very intelligibly. He was then presented to the ladies near him; and his little daughter was introduced. She was a lovely child, of about ten years of age, wearing a head-dress similar to her father's, and in her nose a splendid ring, about the circumference of half-a-crown, to which were suspended an emerald and two large pearls. This ornament is by no means unbecoming, and is equivalent in signification to our wedding-ring. We learned, however, that the little Perojeebhoy was not betrothed, as is usual at her age, her father, with singular liberality, leaving her the privilege of choosing her husband; but that he judged it expedient to conform to the prejudices of his caste by making her wear the nose jewel. Her attire otherwise consisted of a scarlet satin tunic covered with figured lace, trousers of the same materials, a close jacket of dark-blue satin, and four necklaces—one of emeralds, another of sapphires, and the others of large pearls and diamonds: these costly ornaments were valued at L.10,000, or a lac of rupees. The Parsee girls are allowed to mix in society till they attain the age of twelve, when they are closely shut up in the zenana; and it is not considered etiquette to make even an inquiry after their health of their husbands.

Sir Jamsetjee Jeejeebhoy owes his immense fortune, estimated at L.300,000 a year, solely to his industry and energy. He was originally a bottle-wallah, or seller of old bottles; but by carefully husbanding small gains, and living frugally, was at last able to speculate in opium, and other branches of Oriental traffic. His commercial genius directed these speculations so judiciously, that he is now the richest of his race, and the gold thus won is used for the noblest purposes. The sum mentioned above on the authority of the governor, an hospital erected and endowed at his own expense, a causeway to unite the islands of Salsette and Bombay, formerly a dangerous passage—are but a few public instances of his beneficence. When he drives out, he has always a bag of *pice* (halfpence) beside him to throw to the poor, and is of course followed by a strange and motley crew. Dancing followed the presentation, and terminated at eleven by the performance of 'God save the Queen.' We asked the young Parsee if she would like to dance? She replied very quietly, 'No: when I wish for dancing, I need not do it myself; I get people to dance for me; and I wonder the rich English do not

so likewise, instead of dancing themselves.' She made the same observation with regard to music, a stretch of philosophical contempt for the fine arts which we found much more difficult to pardon. At eleven we retired for the night, passing again through the picture-gallery, the floor of which was now partially covered with sleeping figures, closely muffled in long robes, and extended on mats; one Parsee boy being distinguished from his companions by a floating drapery of silver gauze over his head and shoulders. Through the partially-open jalousies shone the lucid stars, looking so clearly bright and solemn, that (but for the mosquitoes) one longed to keep a vigil on 'the house-top,' and watch their silent courses. But the shrill horn of the tiny tormentors hovering round us forbade the wish: this is *their* hour, and their reign is a despotic one. No marvel one cannot see a feature of the dark visages of the sleepers; they are muffled from the burning sting or bite of these evil genii, who as effectually destroy repose as if they were so many troubled consciences.

At the end of the corridor stood an unkindled *shiggry*, or iron basket of charcoal, with a kettle and a fan near it, in case the 'ma'am sahibs' should require tea in the night; and near it sat our seapoy Juan, a tall graceful Hindoo, waiting our coming with his sword beside him, before he also went to sleep, which he did on the mat outside our silken screen. A cup of tea, and a slice of bread and butter, constituted our evening meal, and then we prepared for rest. The lamps of cocoa-nut oil were placed on the matting; the mosquito net had been already let down, as, if kept up after five o'clock, there is a chance of a mosquito finding a hiding-place within it. The bed itself is raised from the floor, and stands on small stone pedestals, hollowed, and filled with water, to prevent the ascent of ants or other insects. Getting within the mosquito net *must* be a very rapid achievement, and is effected while the *ayah* waves a large fan round, to keep off the tiny foe; it is then closely secured, the candles extinguished, and all seek repose. This, nevertheless, is sometimes difficult of attainment, as occasionally the heat at night is intolerably oppressive, and the noises are varied and ceaseless: snakes hiss; a certain unknown insect snores so like a man, that at first I laid the blame of the disturbance on Juan; and the jackals that cross over from Elephanta in search of prey, utter their shrill wail, which bears a painful resemblance to the cry of an infant. Towards midnight, lights glancing by the palm-trees near the tank, the sound of the tom-tom, and of an instrument very like a bagpipe, announced a native wedding in the village, recalling the beautiful parable of the Bridal Virgins; and before the last shrill tones became inaudible, we were in the land of dreams, gazing on home images, and hearing long silent voices; for in sleep the East and its gorgeous visions were invariably forgotten, and we were again in that little northern isle which has no equal either in the Western or Eastern world.

THE DEAF MUSICIAN.

It was the 20th of March 1827. In the poorly-furnished apartment of a small house in Baden in Austria, an old man was making preparations for a journey. He hastily folded within a knapsack a few changes of linen. The weather was cold, the windows were covered with hoarfrost, and yet only a few dying embers burned upon the hearth. Either the old man's mind was too deeply engrossed to think of feeding the flame, or perhaps his scanty resources needed careful husbanding to meet the expenses of his approaching journey.

In truth, the aspect of the room bespoke a state of want rather than of affluence. A bed with curtains of faded green serge, a few antique arm-chairs of varnished wood, covered with well-worn tapestry, a walnut table, and a harpsichord, composed its entire furniture. The harpsichord was strewed with music, partly in manuscript; and a flying sheet covered with nearly illegible notes, and disfigured by numerous erasures, showed

what had been the old man's recent employment. The occupier of this desolate abode was between fifty and sixty years of age. His lofty forehead, encircled by locks of silver gray, beamed with intelligence, although he appeared bowed down beneath the weight of some great affliction. A dark fire kindled in his hazel eyes, and his cheeks, glowing with one bright feverish spot of hectic colour, contrasted strangely with the deadly paleness which overspread the rest of his countenance. When the knapsack was made up, the old man approached the table, on which lay an open letter, stamped with the Vienna postmark. He took it up, and stood a while with his eyes fixed on its contents, though it only contained these few words:—

'My dear Uncle—Pardon me the grief which I am occasioning you; but implicated in an unhappy transaction, I have just received an order to quit Vienna, whence I am commanded for the future to absent myself. I beseech you to come to my aid: you alone can save me. Adieu. JOHN.'

This letter came from a nephew whom he had brought up, and whose disorderly conduct had rendered necessary the rigorous mandate which now banished him from the capital.

When the old man had perused it once more, he appeared confirmed in his resolution, and with his knapsack in one hand, and his walking-stick in the other, he prepared to set out. But on reaching the threshold, he turned back, and casting a look of deep regret on this modest asylum, where he had long and happily dwelt, he sighed; then, as if attracted by a magic charm, he returned to his harpsichord, and quickly laying down what he held in his hands, he ran his fingers over the discoloured notes of the instrument. His gloomy and dejected countenance was gradually lighted up with an expression of intense happiness, and a sublime strain ascended towards Heaven, a fitting hymn of praise to the Almighty.

As he plunged into these regions of harmony, it seemed as if his spirit had bid adieu to earth, and soared to the realms above in search of consolation. But soon all was again silent; the old man wept; he heaved a deep sigh, and exclaimed—'And to think that I can hear nothing!' Alas! he was deaf.

The poor pilgrim again took up his staff, and set forth on his journey. At the turning of the street, he once more looked round on the humble dwelling where he had passed the last ten years of his life, shut out by his infirmity from the sounds of the external world. Music for him only existed *within* the soul. He walked on into the country; for, by way of husbanding his small store, he was going on foot from Baden to Vienna. The evening closed in; the old man stopped before a peasant's cottage. He had presumed too much on his strength, having expected, before night closed in, to reach Vienna, from which the village of Baden is only ten leagues distant. He had walked vigorously, but night approached, and he felt his strength failing him. He knocked at the door; a young girl opened it, asking him what he wanted. The old man, who guessed her question from the movement of her lips, replied, 'Hospitality, my good girl.' 'Come in then: there is always a welcome at my father's hearth for the benighted traveller.' Thus cordially invited, he entered a large room, where the frugal evening repast was smoking upon a homely table. A cover was quickly laid for him near the father of the family, and he sat down to table with the friendly household group. After supper, he seated himself in an old leathern arm-chair by the chimney-corner: a cheerful fire blazed upon the hearth. The mother and daughter cleared the table, whilst the father opened an old harpsichord, and the three sons took down their instruments which hung against the wall. They consisted of an alto, a violoncello, and a hautboy.

The performers attuned their instruments, the mother and daughter seated themselves with their work near the fire, where a single lamp afforded the needful light. The

father gave the signal, and the four musicians began a piece with that *ensemble*, with that knowledge of measure, which the Germans possess beyond all other nations. By degrees their eyes kindled, divers emotions were depicted on their countenances, they abandoned themselves to the ardour of the sentiment with which they were transported. The two women listened whilst they almost held in their breath. Their work fell from their hands. The music ceased—they exchanged looks of delight—the young girl kissed her father's gray hairs with emotion: they forgot the presence of their guest. He had followed all their movements with a longing eye, for his deafness prevented his hearing a single note of the music which had so deeply affected them.

'Oh how happy you are,' he said with a faltering voice, 'to be able to enjoy this delicious pleasure! Alas! it is long since I have been able to hear either the human voice, or music, which is the voice of God. When I go out to meditate in the forest, I *feel* indeed the wind which blows around me, but I *hear* not its mighty voice, whilst it shakes the trees, or murmurs among the leaves, mingling with the general harmony of nature. When I return from my walk at the close of a fine summer's day, I can indeed see the young shepherdess as she leads her flock to be watered at the fountain, but I cannot hear either her joyous song or the tingling sound of the sheep-bells. I can see the lark fly swiftly to the valley where her nest lies hidden, but I hear not her melodious voice mingling with the whisper of the breeze. Oh, music! harmony! it is my life; but, alas! its *vocal* expression is lost to me for ever. Let me, I pray you, read the pages which have so deeply stirred you.' He rose, took the sheet in his hand, a sudden paleness overspread his features; he sunk upon his seat overwhelmed with emotion.

He had just read upon the cover, '*Allegretto, from the Pastoral Symphony of Beethoven.*' All gathered around him, and inquired the cause of his agitation. When he was able at length to command his voice, he arose from his seat and said, '*I am Beethoven!*' At the sound of this name the father lifted his woollen cap from his head, and the sons bowed with the deepest reverence. Beethoven pressed their hands in his, and wept for joy. The good peasants kissed these venerated hands; for this man they felt was the genius who had lightened for them the daily burthen of life—the genius so honoured in Vienna, that when he took his daily walk, the passers-by exclaimed, '*There is Beethoven!*' and silently made way for him, lest they should interrupt his meditations. The peasants looked with unwearied delight on that noble brow where grief had indeed stamped its fatal marks, but which still was encircled with the halo of genius.

Beethoven then seated himself at the harpsichord, and desiring the young people to take up their instruments, he played for them his own symphony. It was a moment of unspeakable happiness.

When they had finished, Beethoven *improvised* sublime melodies: his spirit, breaking through the bonds which enchained him to earth, seemed to rise triumphantly towards Heaven.

The poor harpsichord under his hand gave forth unwonted sounds—sometimes majestic as the voice of thunder, sometimes mysterious as the sighs of the dying.

Alas! it was the song of the swan! A part of the night thus glided on. The bed usually occupied by the father of the family was prepared for Beethoven, and he was constrained to accept it.

During the night he became feverish, and to cool his burning brow, he arose and went out into the open air too slightly clad. The air was bitterly cold: the wind groaned in the branches of the trees, and penetrating rain drifted over the country. When the old man returned, he was benumbed. The dropsy from which he had long suffered mounted to his chest, and too soon it became apparent that all remedies were useless. He was with difficulty transported to Vienna, where he was

visited by a physician, who pronounced his case a hopeless one. Hummel, his dearest and truest friend, heard of his danger, and flew to attend him in his last moments; but he was almost insensible. The words he sought to utter expired on his pallid lips. Still he recognised his early friend, and thanked him with a mournful smile. Hummel pressed the icy-cold hand within his own with deep emotion.

When the dying man felt the pressure, his glazed eye kindled with a momentary consciousness.

He sunk back upon the pillow. With a gentle sigh the spirit had fled!

PRACTICAL APPLICATION OF THE ELECTRIC LIGHT.

A series of beautiful experiments of a most interesting character has been made at the establishment of Professor Glukman, Sackville Street, Dublin, before a number of scientific gentlemen, who deemed the results in the highest degree satisfactory. The principal object sought was to ascertain, among other appliances of the electric light, its power and capability of producing portraits by means of the Daguerreotype as a substitute for the solar rays. In the effectuation of this process the several experiments proved eminently successful, and afforded the greatest satisfaction to all who had the privilege of witnessing them. The electric battery employed was that of Mr Glassford, and under his direction. The illumination obtained was of the most sunlike brilliancy, and remarkable for its steady and luminous bearing on every point towards which the focus of the reflector was directed. The first experiments were on plates prepared by the ordinary process—the battery being managed by Mr Glassford, and the camera and Daguerreotype process by M. Glukman. Portraits were instantaneously produced—the marked fidelity of outline in which, with the depth and delicacy of shade, elicited the highest admiration. After the complete success of the experiment in that respect had been established, a new test of its power was essayed—namely, the preparation of the glass or plate on which the portrait is fixed by means of the electric light. In this novel and ingenious appliance the utmost success also rewarded the efforts of the experimentalists. Surgeon Lover took the direction of the battery; and Mr Glassford having occupied ‘the chair,’ an exquisite portrait of that gentleman was produced in a few seconds. Messrs Galbraith, Yates, and others, who took much interest in the proceedings, also tested the agency of the new power, and expressed themselves delighted with the result.—*Freeman's Journal*.

WHAT ALL MUST EXPECT.

Manhood will come, and old age will come, and the dying bed will come, and the very last look you shall ever cast on your acquaintances will come, and the agony of the parting breath will come, and the time when you are stretched a lifeless corpse before the eyes of weeping relatives will come, and the coffin that is to enclose you will come, and that hour when the company assemble to carry you to the churchyard will come, and that minute when you are put into the grave will come, and the throwing in of the loose earth into the narrow house where you are laid, and the spreading of the green sod over it—all, all will come on every living creature who now hears me; and in a few little years, the minister who now speaks, and the people who now listen, will be carried to their long homes, and make room for another generation. Now all this, you know, must and will happen—your common sense and common experience serve to convince you of it. Perhaps it may have been little thought of in the days of carelessness, and thoughtless, and thankless unconcern which you have spent hitherto; but I call upon you to think of it now, to lay it seriously to heart, and no longer to trifle and delay when the high matters of death, and judgment, and eternity are thus set so evidently before you. And the tidings wherewith I am charged—and the blood lieth upon your own head, and not upon mine, if you will not listen to them—the object of my coming amongst you is to let you know what more things are to come: it is to carry you beyond the regions of sight and of sense, to the regions of faith, and to assure you, in the name of Him who cannot lie, that as sure as the hour of laying the body in the grave comes, so surely will also come the hour of the spirit returning to the God who gave it. Yes, and the day of final reckoning will come, and the appearance of the Son of God in heaven, and His mighty angels around Him, will come, and the

opening of the books will come, and the standing of the men of all generations before the judgment-seat will come, and the solemn passing of that sentence which is to fix you for eternity will come.—*Dr Chalmers's Sermons in Posthumous Works*.

A BENEVOLENT METHOD OF SERVING ONE'S SELF.

An Italian gentleman, with great sagacity, devised a productive pump, and kept it in action at little expense. The garden wall of his villa adjoined the great high road leading from one of the capitals of northern Italy, from which it was distant but a few miles. Possessing within his garden a fine spring of water, he erected on the outside of the wall a pump for public use, and chaining to it a small iron ladle, he placed near it some rude seats for the weary traveller, and by a slight roof of climbing plants protected the whole from the mid-day sun. In this delightful shade the tired and thirsty travellers on that well-beaten road ever and anon reposed and refreshed themselves, and did not fail to put in requisition the services which the pump so opportunely presented to them. From morning till night many a dusty and wayworn pilgrim plied its handle, and went on his way, blessing the liberal proprietor for his kind consideration of the passing stranger. But the owner of the villa was deeply acquainted with human nature. He knew that in that sultry climate the liquid would be more valued from its scarcity, and from the difficulty of acquiring it. He therefore, in order to enhance the value of the gift, wisely arranged the pump, so that its spout was of rather contracted dimensions, and the handle required a moderate application of force to work it. Under these circumstances, the pump raised far more water than could pass through its spout; and to prevent its being wasted, the surplus was conveyed by an invisible channel to a large reservoir judiciously placed for watering the proprietor's own house, stables, and garden, into which about five pints were poured for every spoonful passing out of the spout for the benefit of the weary traveller. Even this latter portion was not entirely neglected, for the waste pipe conveyed the part which ran over from the ladle to some delicious strawberry-beds at a lower level. Perhaps, by a small addition to this ingenious arrangement, some kind-hearted travellers might be induced to indulge their mules and asses with a taste of the same cool and refreshing fluid; thus paying an additional tribute to the skill and sagacity of the benevolent proprietor. My accomplished friend would doubtless make a most popular chancellor of the Exchequer, should his Sardinian majesty require his services in that department of administration.—*Babbage's Thoughts on Taxation*.

EARTH NUTS.

The earth chestnut is the indigenous growth of our soil; but, like the potato plant, before its introduction into this country as an article of sustenance, it is now quite neglected, and nobody thinks it worth while to have a plant in his garden, although it is as plentiful in its native and wild state as the potato is in Peru, or in the first place of its discovery. Yet, by cultivation in two or three years, it will, I have not the least doubt, produce as large a quantity per acre, of a root three times more nutritious than the potato, and at less than one-fourth the expense. The plant is known to almost every schoolboy; it grows in old pastures, and is called in these parts jar nuts, earth nuts, or earth chestnuts. The plant is like a small key, rather larger than a parsley plant, and something like that also; it bears a white flower, and is to be found in almost all old pastures in any part of England. I planted some roots of these nuts (but they may be produced from the seed as well) in the year 1840, and they came up beautifully; and in the summer, when I dug them up, I found some of them two inches in diameter, and nearly as large as a man's fist. I roasted some of them, and found them delicious. They something resemble in taste the sweet potato of Virginia, or roasted chestnut of our own growth. They are a rich vegetable production, containing more of the elements of nutrition than the potato by three times at least, and will be relished as well by the community as soon as they can be introduced.—*Correspondent of Gardeners' and Farmers' Journal*.

LITERARY ASPIRANTS.

I AM a literary man—that is to say, I have only my inkstand for my bank, and have no income to look forward to but what dividend my brains can afford me. I do not, however, grumble at my profession, for I weigh its advantages against its evils, and find they are both nicely balanced, which I take to be as average a state of living as we should expect. Favourable critiques have ceased to make me vain, for I have passed my first youth; and depreciating ones are no longer causes of annoyance, for I express my own opinion at times contrary to that of many others, and must expect others in return to do the same. I never abuse publishers if they do not heap money on me when any work I have sold them makes a 'hit;' on the contrary, I am glad of it, because its publication has been a speculation on their part; and had it not succeeded they would have been the losers, whereas I was safe either way. And lastly—which possibly will not be believed, but I don't care—I am never sore when another book in my own line achieves a success, because it most probably creates new readers still; and so, indirectly, we are all benefited thereby. Writing for periodicals and journals is very wearing work. Sometimes I am very worn and jaded with family matters and the countless engagements of a London life, even when I begin; and sometimes I catch myself heaving a deep sigh whilst penning what may chance to be considered my best bits. But I reflect that possibly my earnings are lightly got in comparison with those of others; and I know, from what I am about to allude to, that many believe they would be supremely happy in my position.

I have worked very hard for these last ten years; and by constantly keeping my name before the public, and now and then by fortunately observing something which they themselves perhaps knew of, and placing its actuality in a pleasant or appropriate light before them, have been considered as one of a somewhat insecure class—that of 'popular' light authors. Hence my name is tolerably well known, as I find from letters which arrive from remote parts of England, bearing unknown postmarks, asking for my autograph 'to add to a collection which,' &c. But I am assured of this, in a manner certainly more troublesome, by certain individuals to whom I am about to allude.

Unless one is in a position to become acquainted with them, nobody can form an idea of the swarms of aspirants bursting to appear in print in London, and, I doubt not, the United Kingdom generally. Editors of magazines know the number of immature communications they receive, aiming at the higher styles of composition, but they do not come in contact with the authors. The manuscripts are 'left with the publishers,' and are called for, and that is all. It is only your ac-

cessible authors who understand fully the daring energies of the 'great unprinted' of the present day.

If we by chance encountered a man who all at once, not being hitherto accounted a mechanic, fancied he could make a church clock, and proceeded gravely to file out pieces of brass, and fix them in certain positions, with the notion that they would work, and inform the town of the time of day, we should say he was remarkably foolish, to use no stronger terms. And yet every known literary man will tell you that every week he has a novel sent him, in manuscript, either by a friend or through his introduction, the first work of a person who, with scarcely a knowledge of putting down a phrase, or the simplest elements of the art of composition, dashes at once at the conventional three volumes, and, as is usual in such cases, only building the characters from types that struck his fancy on reading, and which he thought he could imitate, instead of originating, introduces us to all those old friends in slightly new dresses, characteristic of such productions. The subsequent history of these works is always the same. The literary man is worried into taking the manuscript to a publisher, but of course he cannot recommend it. It is returned, and the author, burning to rush into print, pays heavily for some feeble utterer of false novels to bring it out. Favourable notices in the reviews are begged by all sorts of private manoeuvres; people read these, get the work, and are grievously disappointed; a heavy stock remains on hand, and the author gets off luckily with the loss of a hundred pounds. I have remarked that the majority of these amateurs are ladies; and here at times one's gallantry is severely tested. But it is always in the end kinder and more charitable to crush these aspirations at once, than, by a seeming approval, to lead the writers into all kinds of quicksands and difficulties.

The amateur novelists are bad enough in their way, but they are nothing to the dramatists of the same order. It does not appear to be generally known, even amongst many actual authors, that to write a play which shall have a chance of success requires not only great terseness, and almost epigrammatic closeness of expression, but also a practical knowledge of the mechanical exigencies of the theatre—a story in which a peculiarly constructed or *culminating* interest is needed, and an experience in the action of the different scenes—all which being not attended to, will weary the public, and make them hiss. But our aspirants do not think of all this. One of them calls upon a friend, who may have had one or two successful pieces produced, and something like this conversation ensues:—

Amateur. I wish you would look over a piece I have got here. [*The literary friend trembles, as he knows that in his chiffonier closet there are a score of manuscripts sent for the same purpose, with polite notes.*] If you would

send it to a manager, *your recommendation would do anything. [This is the old story, the amateur forgetting that the author might compromise his reputation for judgment by so doing.]*

Friend. Well, what is it?

A. It's in five acts. *[The countenance of the friend falls, he having thought that it was a harmless farce.]* It's called 'Francesca.' I've taken the subject from old Italian history. There's a great character for — in it. A friend spoke to him about it, and he appeared to like the notion. *[This is the most fatal rock upon which the barks of the amateurs are wrecked. They get some one who knows a performer to mention it to him, and the poor man, not wishing to offend, or driven into a corner, says he thinks the idea good.]*

F. Ah; do you know much about the mechanical appliances of a theatre?

A. Not a great deal. I have gone for poetry and—if I may call it so—elevated writing.

F. Yes, I see. *[The friend looks over the manuscript, and sees speeches of two or three pages long; and the piece altogether would play about seven hours.]* I have not got the time to read it, but I will give you a note of introduction to Mr —, the manager, and I am sure he will pay attention to your views.

A. *[Emphatically.]* Oh—thank you.

The note is written, and the author starts off filled with visions of a great success and being called before the curtain. He leaves his piece, and the first glimpse is sufficient to show that it is an amateur work—one of the hundreds poured into a theatre during a season. The manager wishes you would really not introduce such rubbish to him. The manuscript is thrown by amidst a pile; and the author every week begs you will make an application for its return, as he has called often and can get no reply. Then when he gets it, he hunts you down for introductions to other theatres, and always with the same effect; and at last, finding this piece rejected everywhere, he sets to work and writes another, assumes a coolness towards you, and fastens on another writer.

The most indefatigable class, however, are the aspirants to periodicals, and small poets. During my connection with a tolerably well-known 'monthly,' scarcely a day passed but one called, either an acquaintance or with a letter of introduction. It was the same story with all. 'They knew I could do anything with —.' Would I get the article into his magazine if, upon reading, I thought it suitable? I really did read a great many of these, but none were ever available. If the notion was original, the style was either immature or over-elaborated; and if betraying some knowledge of construction, the articles were nothing more than clever imitations of popular writers. The would-be aspirants to light literature were the most painful—those who thought it comic to use such phrases as, 'the immense sum of eighteen-pence,' or, 'that specimen of sable humanity yclept a chimney-sweep;' or believed that humour consisted in a simple change of synonymes, such as calling an old maid an 'antiquated spinster;' or in that elaboration of meaning by which a dancing-master was described as 'a professor of the saltatory art' (which, according to the present style, he is *not*); and the simple word 'married' could only be explained as 'led to the hymeneal altar.' In fact, the drollery chiefly aimed at was of the school in which police cases are written by facetious reporters. I once heard from the treasurer of one of our largest theatres, that in the course of twelve years he never knew an amateur play accepted; and I may add, in like manner, that during my connection with the magazine I never knew an amateur 'funny' paper made use of. Yet the constant rebuffs do not check the aspirants. With the elasticity of Indian-rubber balls, which would be invaluable otherwise directed, the harder they get knocked down the higher they rebound.

The poets, as a mass, are less troublesome, for the fashion-books and annuals open some refuge to them.

Besides, their productions being usually comparatively short, they can with less expense get them printed and published. In this latter case it is curious to observe that the preface is always the same. The author invariably remarks, that 'several kind, but in this instance, he fears, too partial friends, have suggested the publication;' and then he assumes the habits of the 'lion' in society, loves to read his own works, gasps for notices, and believes, in common with most young authors, that his ideas have pervaded the entire world.

Perhaps the aspirants will now ask, 'How does anybody begin?' If they are curious to know, I will tell them how I began myself: and I pray them not to accuse me of egotism, which would be most contemptible, but rather look upon the statement as a wish to show them that I am practical and somewhat experienced, when I say that I have written several novels, and produced several plays, which have met with more or less success; that I have now and then attempted poetry, when applied to by composers for the words of ballads; that I have written sketches for magazines, criticisms and notices for newspapers, and paragraphs for light ephemeral periodicals; in fact, that I have gone through all the work which a man must be *au fait* at to attain even the humblest position in the high-pressure literature of the present day.

I began, then, as every profession ought to be commenced, with the rudiments. I used first to make up, with great care and trouble, small paragraphs and notions which struck me as I walked about, for little penny publications, and put them, unknown to any one, into the editor's box. This was when I was at school. Sometimes these were printed—which was a circumstance of great but secret glory to me; sometimes they never appeared, and I heard no more of them. After a time, I began to see the style which was usually the most fortunate. I found that little domestic sketches, made from actual observation, and not comic invention, were readily accepted. The materials for these were within my grasp; indeed, never having read much, I did not attempt to soar beyond them. My paragraphs grew to sketches; my sketches to more finished delineations; and at last I tried a short story, and sent it to a periodical which was exactly the size of the old 'Mirror.' It was directly accepted and printed; and with an engagement forthwith to write at half-a-crown a column, I considered my fortune made.

The periodical failed; but I was still so delighted at communicating my notions to (as I considered) the world, and fancying they sympathised with some of them, that I went on writing for nothing, when certainly I ought to have been at times attending to something else. I then went to study abroad; and an adventure occurring to me, which found its way into the London papers, I was applied to by the editor of a magazine to send in an account of it. This was an honour I had never dreamed of. I transmitted my seven or eight pages, and they appeared. Two or three kind opinions were passed on the article; and I soon found myself a regular contributor. I then began a story, to be finished in two chapters, one each month. There was something in the first that appeared to please my readers, and the editor asked me if I could not elongate it into six. When the fourth was sent in, I was asked if I could not extend the sketch to the length of a three-volume novel. I was so frightened at this that I took two days to consider; and at last, in great nervous anxiety and mistrust, acquiesced. With this novel possibly you may be acquainted; and its completion and tolerably-favourable reception brought me up to London. But otherwise I should never have conceived so daring a project.

From this time I got a great deal to do, but I never sought it. An engagement to write small essays on social topics for a paper, led me to the position of the theatrical critic, on the secession of my predecessor; the principal reason for this being that my style and opinions were known to the proprietors. Then, as from

constant attendance I got experienced in dramatic matters, and saw tolerably well what would, and what would not succeed, the authors used occasionally to ask my opinion about hazardous points or effects in their works; and finally, one suggested that I should join him in concocting a piece. Fortunately this was very successful, and I learned more on its production than years of mere observation before the curtain would have taught me. Then I tried a play, at a minor theatre, myself, and had ten shillings a night for it. Several pieces in two and three acts followed, with varying luck, but never very bad; and now I have produced a dozen. But I should think myself crazy to start on a five-act piece, like all those which the aspirants wish to have forthwith accepted and represented.

I have thus endeavoured to show that the progress of a literary man is very gradual—step by step, and each step made sure before the next is taken. Amateurs think because at times an author comes suddenly and brilliantly before them, whose name they were hitherto unacquainted with, that this *coup* has been obtained all at once. It is not so, however. Be sure that he has worked long and patiently at other matters, and commenced with the humblest compositions, and anonymously. Rare instances to the contrary occur, it is true; but every rule has exceptions except one—and that is, when an amateur, unprepared by experience, and for no other purpose apparently than the mere gratification of a little vanity, produces off at once a mass of manuscript, the best thing he can do with it, to avoid much expense and disappointment to himself, and the chance of occupying the time and compromising the recommendation of his literary friends, is to put it in the fire.

A. S.

OPTICAL MAGIC OF OUR AGE.

ANY one who is at all familiar with the optical illusions and scenic effects which form a favourite portion of some of our public exhibitions, must be convinced that the art of producing these phenomena, with their various and mind-bewildering play of colours and change of character, has attained great perfection. But probably few persons are in the least degree acquainted with the manner in which the appearances they so much admire are produced. It will therefore be possibly an interesting subject to many, if we glance first at the optical phenomena themselves, and then proceed to explain the method of their production.

The magical effects which owe their origin to the magic lantern, are those which will chiefly occupy our attention; and it will be found that the position of this ingenious instrument in the popular estimation is very far below that which it deserves to occupy. In fact, all those appearances which so much perplex, surprise, or please us in exhibitions of this kind, are entirely due to various ingenious contrivances appended to, or in connection with, this instrument, although this fact is but little known generally. This instrument, as now employed, is the same in principle as it was when first invented in the middle of the seventeenth century by the universal genius, Kircher; but in common with most other optical apparatus, it has largely benefited by the advance of mechanical and mathematical science, and is now constructed in a form apparently little capable of further improvement. Essentially, it consists in its improved form of a powerful source of light, of two double convex lenses which concentrate the rays, and direct them upon the picture placed in front of them; and of two other lenses which concentrate the rays after they have passed through the picture, and direct them on the disk where the image is beheld by the spectators. There is a little contrivance of some importance which has been added by Messrs Carpenter and Westley of London to

the extremity of the brass tube holding the second pair of lenses, by which some of the extreme rays are cut off, the effect of which is to give a great degree of distinctness to the depicted image, although with some sacrifice of illuminating power. This contrivance consists simply of a brass ring, and may be adopted or removed at pleasure. From this casual description of the instrument, it will be manifest that the various delusions and singularities of effect we are about to describe are referable not so much to any alteration effected by modern science in the principal instrument, as to the accessories of the exhibition. But let us admit the reader into the mysterious apartment, where science can bid to appear more and more strange phantasms than ever obeyed the summons of enchanter's wand.

And first about the *Phantasmagoria*. In 1802 a French gentleman, a M. Philipstal, astonished crowds of people in London by an optical exhibition which he entitled the *Phantasmagoria*. It was a soul-appalling spectacle to those who had hitherto been ignorant of the wonders of light and shade! The spectator was a room where no light but that of a dismal oil-lamp hanging in the centre was admitted. On the assembling of the audience, this lamp was drawn up into a chimney, and a pitchy gloom overspread the place. Presently the soft and mournful notes of sepulchral music were heard, and a curtain rose displaying a cavern, on the frowning walls of which were depicted the forms of skeletons and spectral figures. The music ceased: the rumbling of thunder was heard in the distance. Gradually it became louder, until at length vivid flashes of lightning, accompanied with peals apparently of the deep-toned organ of the skies, gave all the impressions of a tremendous storm. The thunder and lightning continued at their height, when suddenly a small cloud of light appeared in the air; it gradually increased in size, until at length it stood revealed a ghastly spectre, around whom the lightning gleamed in fearful reality. Its eyes moved agonizedly from side to side, or now turned up in the sunken eye-socket, the image of unutterable despair. Away, back to the dim abyss from whence it came, it was seen swiftly to retire, and finally vanished in a little cloud, the storm rolling away at the same time. Then came other phantasms, some of which rushed up with apparently amazing rapidity, approaching the spectators, and again as rapidly receding—to return clothed with flesh and blood, or in the form of some well-known public personages! After a display of a number of similar apparitions, the curtain fell, and the lamp was uncovered; the spectators departing with expressions of great astonishment at what had been seen. Such was the early introduction of the *Phantasmagoria* to the honours of a public exhibition.

This variety of optical effect, although occasionally resorted to since that time, has only recently been reintroduced at some of our public places of resort in more than its original power. In some of these exhibitions the effect on the mind is indescribable, and in a less enlightened age would be far from desirable; but all are now so well acquainted with the source of the awful and mysterious beings which appear to present themselves to the eye, that the exhibition simply creates wonder where it would formerly have excited superstition or alarm. Images of birds on the wing are introduced with great force: the bird is seen rapidly moving its pinions, apparently at a great distance, then swiftly approaching and increasing in size. Motion is also given to its eyes; and when a particularly solemn-looking bird, like the owl, is selected, the effect is, to say the least, very remarkable. Scenes are now introduced in which a movement of figures is managed with great adroitness—a fiery snake, for example, may be seen winding its undulating body across some in-caverned pool. Then appears a fairy scene, where fountains are playing, and Cupids flying about or shooting at a target in whose centre—to carry

out the poetical idea—is a bleeding heart: or, through a narrow gorge, we catch a glimpse of a lake encamped round about by tall mountains; and behold! some Undine or water-spirit, with her attendant sprites, appears in a majestic chariot drawn by the most graceful of swans, whose long necks are elegantly bent into the waters every now and then! Again, a cloud of fire hangs in mid-air, enlarges, brightens, and rolls gradually aside, disclosing one of the mythological impersonations seated in the *quadriga*. A favourite concluding scene is a British oak. While the spectators are looking on, and listening to—of course—‘Rule Britannia,’ suddenly, in every bough, behold! a flight, a whole flight of sailor-boys waving the Union Jack: the trunk opens, and out steps the sailor-prince; presently the sailors in the branches take their flight, the prince once more is received into the mighty trunk, and the scene vanishes.

Some of the minor phantasmagoric displays descend to the ludicrous. The spectacle of an industrious cobbler, who heaves long-drawn gasps for breath, and busily plies his arms, is much admired among this series; and the knowing look of the eyes is wonderfully productive of merriment. The next scene is a view by the sea-side, where a bathing woman is seen dipping a reluctant little girl into the rolling waters: smiths are seen hammering ferociously upon their anvils: shoe-blacks are giving exquisite lustre to boots: old men are breaking up stones, or bowing politely, and unbosoming to draw forth the charities of cottage-door lingerers: the chameleon is well shown in all his versatility of tint: and roses, tulips, and other flowers, including cauliflower, blossom with Cupids, white and black, or other representations grotesque as unexpected. Perhaps the most extraordinary of them all is the feat of a man asleep in a bed, who swallows rats and mice by the dozen, and without awaking!

The explanation of these varied effects is very simple: the phantasmagoric displays are always shown upon a transparent screen; a broad piece of *Nainsooks* muslin wetted with water, and fixed in a convenient position, is better than any other contrivance whatever. The magic lantern, slightly modified, is the instrument employed for developing the images, and is thus managed:—it is either held in the hand or placed upon a little railway: it is then brought close up to the screen, the light being shaded by the hand; and when sufficiently near, the hand is removed, and there appears on the screen a little cloud of light without any definite image depicted in it. The lantern is then gently carried backwards, and there appears on the screen the gradually-enlarging image of some spectre, or other object, which appears rapidly to approach the spectators. On bringing the lantern back again nearly up to the screen, the spectre seems to recede, and finally vanishes in the little cloud spoken of: thus is the astonishing effect of advancing and receding images accomplished. It requires of course some little arrangements as to focus; and mechanical contrivances for effecting this have been applied to the carriage of the lantern successfully. Sending up a balloon is well exhibited by this means: the balloon, at first swelled in all its vast proportions, presently becomes smaller and smaller until it is lost to sight; and by a little swaying of the lantern from side to side, the undulating character of its motion is well represented. By using two, three, or even four lanterns in the hands of several clever assistants, a surprising degree of life can be given to the scene. One manages the flying Cupid; another the moving chariot; a third the fountain; and so on. By means of two lanterns, Fame may be made to descend from the skies and plant a laurel-wreath on a warrior or a statesman's brow. The opening of clouds is effected by drawing gently aside two slips of glass which cover the slider containing the picture; the figure behind thus seems to step out of the clouds. Movement is communicated to the figures in various ways: sometimes in the manner already described, by a separate lantern; more frequently by a double slider, one slider being painted black, with the exception of a clear space, through which the head or some one of the limbs is shown or obscured at pleasure: thus a cook carrying in a pig's

head alternately loses and regains his own by moving the slider to and fro. The rolling about of spectral eyes is effected by painting them upon a slider which moves from side to side, the eyeballs showing through the eye-sockets of the image with singular effect. A water-wheel is set in motion by a double slider, on one of which the landscape is painted, on the other the wheel; and this one is moved round by a pinion-wheel working into a cogged rim. The reeling motion of a ship is given by a slider moved up and down by a lever. A little reflection will soon show the infinite number of movements which by these simple means may be effected. A very strange effect is sometimes produced by giving the lantern a sudden shake, when the images will seem as if seized with a cold shudder.

Leaving, however, the chamber of scientific horrors and supernaturalities, let us advert briefly to the more recent and beautiful discovery, the *Dissolving Views*. Very few persons are, we believe, at all aware of the means by which the exquisite effects of these exhibitions are accomplished; yet they are surprisingly simple. A country landscape, basking in the warm glow of a July sun, lies outspread before us; the fields are golden with corn, the trees in full verdure clad, and the water tumbles, half in play half at work, upon the over-shot wheel of the mill in the foreground. A change comes o'er the spirit of the scene: the sky loses its warm and glowing tone; a cold, gray, ghastly look creeps over the picture; the air darkens; the babbling stream is stayed in icy bondage; the wheel has stopped, and icicles a foot long hang from its spokes and rim; the trees are leafless; the fields are brown and naked; the path is covered with snow; and the flickerings of a roaring fire are seen through the cottage windows. But, marvel of marvels! the sky grows thick and lowering, and a few flakes of snow are seen to fall. Presently a thick shower of snow descends. The illusion is complete, and it requires some little self-recollection to form the conception that, after all, it is a mere picture we are looking upon. The snow-storm passes over, the sky and air gently resume their warmer aspect, leaves come on the trees, the snow melts away, the brook runs again, and the wheel resumes its duties, for summer has returned! This sketch presents us with the leading features of the *Dissolving Views*: let us now explain how the changes are brought about.

To exhibit the *Dissolving Views*, two lanterns of equal size, and placed on the same platform, are necessary. In the one we will suppose the summer scene; in the other, the same scene, but in its winter dress. Now, immediately in front of the brass tubes of both lanterns is a circular disk of japanned tin, in which a crescentic slit is perforated half round near the rim. This disk is made to revolve on an axis which passes between the two lanterns, and is moved by a little handle behind. The rays of light proceed through the slit on to the screen, but only allow those of one lantern to do so at one time, the tube of the other being shaded by the imperforate part of the disk. The rays of the summer scene are now pouring through this slit, while those of winter are obscured by the other part of the disk. The lanterns being properly arranged, so as to cast their images on precisely the same place on the screen, the exhibition begins. Summer is shown for a little time; then by means of the little handle the disk is very gently turned round, and thus while, from the crescent shape of the slit, the rays of one lantern are gradually cut off, those of the other are at the same time gradually allowed to fall on the screen, until the disk is turned quite round; and now the tube through which summer shone is obscured, while the colder light of winter from the other tube streams through the slit in the disk. The effect to the beholder is the gradual and imperceptible transition of the one scene into the other. If the reader will be so kind as to suppose that his two eyes represented the magic lanterns, and will close one eye first, and then gently lift the lid while he shuts down that of the other, he will obtain a perfect idea of the dissolving mechanism. The plan of the perforated disk, which, as being the most gradual, is the most perfect, is the plan observed in the instruments we have seen of

Messrs Carpenter and Westley's make; but there are other and simpler means of effecting the same object, the principle remaining in every instance the same; namely, the gradual blinding of one lantern, and unblinding of another. To produce the falling of the snow, a slider is introduced upon the previously blinded side, a cap is unscrewed off the disk, and so both tubes shed their light on the screen. The slider is painted black, with little dots scraped out to represent snow-flakes; and on its being set in motion by a wheel, the appearance on the screen of these moving dots of light is exactly that of snow-flakes falling. We have understood that the best effect is produced by drawing a piece of perforated paper slowly upwards in the place where the sliders go. This principle of causing the light from two lanterns to fall upon the screen—the one producing the picture, the other introducing some fresh elements into its composition—is largely applicable for the development of other effects besides the falling of snow. By representing a Lapland scene with one lantern, a beautiful resemblance of the Northern Lights, or aurora, can be thrown on the sky by means of the other lantern, and when well managed, the effect is most extraordinary. Lightning or a rainbow is thrown on the scene by the same means. The flickering fiery glow of a volcano, or a ship on fire, is managed by quickly moving the fingers, so as alternately to intercept and give passage to the rays streaming from the tube: this appearance, too, is very singular and real.

A word now about the *Chromatope*—literally, the colour-turner. The image on the screen produced by this instrument may be described for those who have not seen it as strongly resembling that presented to the eye by the kaleidoscope. A mixed, moving multitude of colours, vying in lustre with the precious stones, are seen whirling together, threading in and out; now, as it were, blown from a trumpet-mouth, now pouring back into the same, and in their revolutions producing a variety and perplexity of patterns which would weary even the eyes of a manufacturer to gaze upon. These results are produced by means of compound sliders, two or three in one. Two of these are movable, the third is often fixed. They are painted variously in designs of different colours, consisting generally of some combination of circles or other mathematical figures: all the portion of the glass containing no figure is painted black. The movable glasses are turned in different directions by a handle attached to the slider, and the result is the complicated play of colours and forms which is depicted on the screen. A somewhat similar but more varied effect was produced soon after the invention of the kaleidoscope by Sir D. Brewster, by adapting that beautiful instrument to the magic lantern, and was exhibited by a celebrated chemical lecturer to his class. But the present is the simplest form, and in the beauty of its images leaves little to be desired. Two lanterns are commonly employed in its exhibition, so as to avoid any stoppage of the performance. The appearance of a fountain casting up water is managed by a variety of the same contrivance as the *Chromatope*. The introduction of this variety of optical image is recent.

The exhibitions which have received the fantastic titles—the *Opaque Microscope*, and the *Physioscope*, are very pleasing of their kind, and may be readily made intelligible to the reader. By the contrivance entitled the *Opaque Microscope*, the images of medallions, bas-reliefs, Paris-plaster casts, and other opaque objects, are thrown on the screen, and produce a singular raised effect. The surface of these objects is very highly polished, and they are introduced within the body of the lantern: a strong light there falling upon them in a particular position is reflected from their surface on to a concave mirror, and thence through the lenses of the tube of the lantern on to the screen: thus the image is produced. The *Physioscope* is apparently a modification of Sir D. Brewster's contrivance for the exhibition of what he calls the *Catadioptrical Phantasmagoria*. The visitors to the Royal Polytechnic Institution used nightly to be diverted by beholding a benevolent old gentleman's half-figure in gigantic proportions upon the screen. For

their amusement this old gentleman used to drink wine, eat buns, gape and sneeze, all of course in the most life-like manner; and generally finished the exhibition by standing gradually up, and revealing a stature as tall as any of the monsters commemorated in fable or in song. This really remarkable exhibition is produced in the following manner:—in an apartment out of sight of the spectators are a large concave mirror, a powerful light, and the person whose figure is to be thrown on the screen. He is so placed that the rays of light reflected by his person are received by the mirror, and, collected by it, are reflected through a lens, and then directed on to the screen, where they appear in the form of a gigantic image. Other objects may be effectively exhibited by the same means; and some singular and startling effects are capable of being produced, such as the decapitation of a warrior, and restoring his head again, and such-like, by intercepting a part of the reflected rays from the mirror by means of a prism. In this, as indeed in all the other exhibitions, everything depends on the power of the artificial light; and the oxyhydrogen lime-light is the best for this purpose. The electric light, could it be made steady and permanent, would prove valuable. In exhibiting the human face, the glare has the disagreeable result of causing the eyes to blink, and thus in some measure interfere with the perfection of the image.

The last marvel of our modern optical magicians that we shall notice is the *Diorama*. This beautiful method of exhibiting optical effects is, we believe, the invention of M. Daguerre and another gentleman. In the production of a life-like impression on the eye, this Diorama is unequalled by any other contrivance: it is nature itself. All the accidents of the landscape—sudden gleams of sunshine, the passage of a cloud, the dim diffusive light of early morning or approaching night, are all thrown in indescribable beauty and truthfulness upon the painting. The solemn soul-subduing influence of some of the scenes which have been exhibited at the Regent's Park in the metropolis cannot be conveyed in words. The destruction of an Alpine village by an avalanche can never be forgotten after it has been once seen. The manner of effecting this representation is strikingly simple: the spectator is a darkened room, which revolves upon rollers; the sight-aperture, or proscenium, is of moderate size, and through it is seen a large painting representing some scene or celebrated locality. The light is thrown upon this picture from above, through ground-glass; and arrangements exist, by means of shutters and blinds, to modulate the tone of the light cast upon the picture, so as to imitate with the nicest accuracy the natural effects of light and shadow. Some parts of the painting are transparent, permitting light from behind to be employed with great effect, where a chapel or such-like scene is to be lit up at night. By having two pictures, the spectators are insensibly carried round to behold first one, and then the other. In some large continental dioramas several pictures are employed. Few who have witnessed the changes represented in a well-managed dioramic exhibition, would believe that the whole art consisted, as we have seen, in a skilful manner of operating with light.

Before concluding this article, we may be allowed to express pleasure at the rational amusement which may be afforded by means of the simple instrumentality here variously described, in addition to the lighter diversions also spoken of. The various sciences of astronomy, natural history, meteorology, botany, anatomy, geography—are all capable of the most beautiful illustration by the same means as, when amusement is the object, will develop all the phenomena of the *Phantasmagoria* and *Dissolving Views*. Need we repeat it? This is simply the magic lantern fitted with the appliances of modern science. Well is it for our age that the powers conferred by science on man are no longer, as formerly, prostituted to enslave the mind in the bondage of heathen ignorance and superstitions. Far from feeling terror, even a child would now laugh at what once made the stoutest heart quail in the courts of Grecian and Roman temples—the apparition of the so-called 'divinity' on the wall of the building, or amid the fires of the sacrificial rites. There

is every reason to believe that to ends base as these, as dishonouring to the Former of all things, as enslaving to the minds of the people, were the interesting phenomena of light and shade of which we have here spoken once, and for a protracted period, made subservient. The optical magic of our age, we may thankfully say, sets up no claim to the supernatural.

MR ROBERT SIMPSON'S COURTSHIP.

ABOUT three years have elapsed since Mr Robert Simpson succeeded, at the demise of Mr Isaac Simpson, ironmonger by trade, fishmonger by Livery, and common councilman of the City of London by election, to the prosperous business and municipal honours established and acquired by his respectable, painstaking parent. Some natural tears he shed; but, the exigencies of business and the duties of his corporate office—replacing, as he immediately did, his father in the representation of the important ward in which his shop was situated—not permitting a protracted indulgence in the selfish luxury of wo, he fortunately recovered his equanimity in a much less space of time than persons acquainted with the extreme tenderness of his disposition had thought possible. Mr Robert Simpson, albeit arrived at the mature age of thirty-five, was still a bachelor; and not only unappropriated, but, as ward-rumour reported, unpromised; at perfect liberty, in fact, to bestow himself, his very desirable stock in trade, business premises, and three freehold houses in the Poultry, upon any fair lady fortunate enough to engage his affection, and able to return it. Indeed to this circumstance, it was whispered at the time of his election, he owed his unopposed return to the municipal niche so long and worthily occupied by his departed father; Mr Crowley, the highly-respectable spectacle-maker, having suddenly withdrawn from the contest on the very day of nomination; thereto induced, hinted gossips of the City, by the fact that Miss Crowley, who chanced to meet Mr Robert Simpson on the previous evening at the house of a mutual acquaintance, had been by him most courteously and gallantly escorted home. The matrimonial inference drawn from so slight a premise as a few minutes' walk along unromantic Cheapside, by gas, not moonlight, proved, as might be expected, an altogether erroneous one. The Fates had other views regarding the prosperous ironmonger; and as those 'sisters three,' like most ladies, generally contrive to have their own way, Mr Simpson was ultimately quite otherwise disposed of; and Miss Crowley, for aught I know to the contrary, remains Miss Crowley to this day.

Not that Mr Simpson was by any means insensible to female fascination: he was, unfortunately for his own peace of mind, somewhat too susceptible; an ardent admirer of beauty in all its hues and varieties, from the fair and delicate grace and beauty of the maidens of the pale north, to the richer glow and warmer tints of orient loveliness. The strict surveillance of his honoured father, joined to a constitutional timidity he was quite unable to overcome, had, however, sufficed during that gentleman's lifetime to prevent rash impulse from eventuating in rash deed. He was also, I must mention, extremely fastidious in his notions of feminine delicacy and reserve; and his especial antipathies were red hair, or any hue approaching to red, and obliquity of vision of the slightest kind. Such was the Mr Robert Simpson who, about two o'clock on the afternoon of March the 1st, 1847, stepped, richly and scrupulously attired, into a Brougham, specially retained to convey him to dine at his friend Mr John Puckford's modest, but comfortable establishment at Mile End, where he was by express arrangement to meet his expected, expectant bride. Before, however, relating what there befell him, it will be necessary to put the reader in possession of certain important incidents which had occurred during the three previous days.

On the evening of the preceding Tuesday, Mr Simpson, finding himself at the east end of the town, and moreover strongly disposed for a cup of tea and a quiet gossip, resolved to 'drop in' upon his new acquaintance Mr

John Puckford, hoping to find him and his wife alone. In this, however, he was doomed to disappointment; for he had scarcely withdrawn his hand from the knocker, when he was startled—Mr Simpson was, as I have before hinted, a singularly bashful person in the presence of the fairer and better half of creation—by the sound of female voices issuing, in exuberant merriment, from the front parlour. There was company it was evident; and Mr Simpson's first impulse was to fly: as the thought crossed his mind, the door opened, and Mr Puckford, who chanced to be in the passage, espying him, he was fain to make a virtue of necessity, and was speedily in the midst of the merry party whose gaiety had so alarmed him. That the introduction was managed in the usual way, I have no doubt; but the names, however distinctly uttered, seem to have made no impression upon the confused brain of the bashful visitor; so that when, after the lapse of a few minutes, he began to recover his composure, he found himself in the presence of three ladies and one gentleman, of whose names, as well as persons, he was profoundly ignorant. The ladies were two of Mrs Puckford's married sisters, and Miss Fortescue, a young lady of reduced fortunes, at present occupied as teacher in a neighbouring seminary. The gentleman was Mr Alfred Gray, a bachelor like Mr Simpson, but nothing like so old, and scarcely so bashful. Mrs Frazer, the eldest of the two sisters, a charming lady-like person, of, you would say, judging from appearances, about twenty-three or twenty-four years of age, seemed—after some oscillation between her and Mrs Holland, whose fuller proportions, dark hair, and brunet complexion, contrasted not unfavourably with the lighter figure, and fair hair and features of her sister—to engross Mr Simpson's whole attention, and to arouse after a while all his conversational energies, which, by the way, were by no means contemptible. Mr Simpson's time was come: ere a couple of hours had fled, the hapless ironmonger was hurt past all surgery; had fallen desperately in love with a married lady, and the mother of three or four children! On the only single female present, Miss Fortescue, Mr Simpson had bestowed but one glance on entering the apartment: that had been quite sufficient to check any desire for a more intimate perusal of her features. The lady combined his two antipathies: her hair was decidedly red; and a strong *cast*, to use a mild term, detracted from the uncommon brilliancy of her mind-glancing eyes. She took very slight part in the conversation; and that little, so absorbed was Mr Simpson, was by him utterly unheeded. She wore, like her friend Mrs Frazer, a plaid-dress, and the baptismal name of both was Mary.

The ladies departed early, and Mr Simpson and Mr Gray followed their example a few minutes afterwards. 'Mr Gray,' said the former gentleman, as he took leave of his companion at the end of the street, 'what is that charming person's name? I have quite forgotten it.'

'Which charming person?' inquired Mr Alfred Gray with a quiet smile.

This Mr Simpson thought a very absurd question; he, however, replied—'The lady in the plaid-dress: Mary, Mrs Puckford called her.'

'The lady in a plaid-dress, whom Mrs Puckford called Mary, is a Miss Fortescue: she is a teacher of music and drawing,' rejoined Mr Gray with demure accent. It was too dark for Mr Simpson to see his eyes.

'Thank you, sir: good-night,' rejoined the enamoured municipal dignitary. Mr Simpson was soon at home, and before an hour had elapsed, had carefully penned, and posted with his own hands, a letter to his friend Puckford. He then retired to bed, and dreamt dreams.

'Sarah,' said Mr Puckford the next morning to his wife after reading a letter, just delivered, with a perplexed expression of countenance—'did Mr Simpson seem to you particularly struck with Mary Fortescue yesterday evening?'

'With Mary Fortescue? Surely not. Why do you ask?'

'Only that here is a letter from Simpson professing violent love for her; and stating his determination, should

you and I be able to assure him, which he scarcely dares venture to hope, that she is disengaged, to immediately solicit her hand in marriage!

'Gracious!—Is it possible?'

'Read the letter yourself. Her beauty, he observes, is, he is quite sure, her least recommendation. Comical, isn't it?'

'Well, it is odd; but she is, you know, a most amiable creature; and will make, I am sure, an admirable wife.'

'And he, too, that so especially detests red hair, or the slightest twist in the organs of vision?'

'Mary Fortescue's hair,' interrupted the wife, 'can scarcely be called red: a very deep gold colour I should say.'

'Very deep indeed—remarkably so,' interjected Mr Puckford.

'And as to the slight cast in her eyes, that no one observes after a few days' acquaintance with her.'

'I suppose we may with a safe conscience assure him that she is not engaged?'

'Of course we may. It is a wonderful match for her, and we ought to do all we can to forward it. Friday next, the 1st of March, is Alfred's birthday; suppose you ask him to dine with us on that day to meet her! We need have only the same party he met yesterday evening.'

This was finally agreed upon; and accordingly, as soon as he had finished his business in the City, Mr Puckford, previous to returning home, called on Mr Simpson. He found him in a state of great excitement, which, however, gradually calmed down after Mr Puckford's solemn assurance, which he gave unhesitatingly, that the charming Mary Fortescue was certainly disengaged; and, in his opinion, by no means indisposed to entertain an eligible matrimonial proposition. All this was balm to the stricken Simpson; and after several failures, he at last succeeded in inditing a formal offer of his hand and fortune to the lady of his affection; of which impassioned missive Mrs Puckford was to be the bearer; her husband undertaking that she would exert all her eloquence and influence to secure acceptance of the proposal.

'And now, Puckford,' said Mr Simpson, 'we'll have a glass of wine, and drink the future Mrs Simpson's health. What a charming ornament,' he added with a sort of rapturous sigh, as he placed the decanters on the table—'what a charming ornament she would be to this fireplace!'

'An odd expression that!' thought Mr Puckford, forgetting that the speaker was an ironmonger, and dealt in such articles. In fact, from the way in which Simpson had been rapturising upon Miss Fortescue's charms, a doubt of his friend's perfect sanity had sprung up in John Puckford's mind; and he shrewdly suspected that the affair would terminate in a *de lunatico inquirendo* instead of a license.

'Do you know, Puckford,' said Mr Simpson with a benevolent, patronising air, after the third or fourth glass—'do you know I fancy there is a great likeness between you and Mary Fortescue?'

Mr John Puckford, the reader must understand, was a handsome young man with a brilliant florid complexion, perfectly-agreeing vision, and light-brown hair. No wonder, therefore, he was more startled than flattered by the comparison. The colour mounted to his temples, and a conviction of Simpson's utter insanity flashed across his brain. 'Mad as a March hare!' he mentally ejaculated; at the same time resolving, should the paroxysm grow dangerously violent, to knock him down with one of the decanters; both of which, as two could play at that game, he drew, as if in doubt which wine he would take, to his own side of the table. Mr Simpson, mistaking the nature of his friend's emotion, added, 'Don't suppose, Puckford, I intend any absurd flattery!'

'Not at all, Simpson; I didn't suppose anything of the sort, I assure you.'

'To be sure not; nothing is more contemptible. You are a good-looking fellow—very: but of course I couldn't mean that you, a man, are to be compared to Mary Fortescue.'

'I should think not!' drily responded the more and more mystified and bewildered Puckford.

'Exactly: you do not resemble each other about the eyes, either in colour or expression.'

'Oh!'

'No: as to hair,' continued Mr Simpson meditatively, 'yours, there can be no doubt, is decidedly the lightest.'

'It's coming now,' thought Mr John Puckford, grasping at the same time one of the decanters, and eyeing his friend intently.

Mr Simpson, quite misinterpreting the action, added quickly, 'Do, my good fellow, fill me a bumper, and we'll drink her good-looking friend's health—the lady, I mean, with the dark silky hair and brunette complexion. Do you know,' continued the complacent Simpson, crossing his legs, throwing himself back easily in his chair, and hooking his thumbs to the arm-holes of his waistcoat—'do you know that, if Mary Fortescue had not been at your house yesterday evening, I might have—'

What the worthy ironmonger might, in the case supposed, have done or said, must be left to the reader's imagination, for on the instant a clerk hurriedly entered the apartment, to announce that an important customer awaited Mr Simpson in the counting-house below. Hastily rising, Mr Simpson shook hands with his friend, and both departed their several ways: Mr Puckford bearing off the epistle addressed to Miss Fortescue, and musing as he went upon lover-madness, which, he fully agreed with Rosalind, deserved chains and a dark house quite as much as any other variety of the disease.

The next day Mr Simpson received a note from Mary Fortescue, modestly and gracefully expressed, in which, with charming humility, and many expressions of gratified surprise, the offer of his hand was—on one condition, unexplained, but which rested altogether with himself—gratefully accepted.

Such was the state of affairs when, on the 1st of March, Mr Simpson, as I have before stated, entered a Brougham, and directed the driver to make the best of his way to Mile End. It was a fine bright and exceedingly cold day; but notwithstanding the nipping eager air, the love-lorn ironmonger, as he approached the house which contained his charmer, was in a state of profuse perspiration and high nervous excitement. Once more he drew from his pocket the fairy note, and glanced over the modest, grateful, delicately-feminine expressions. 'Dear lady,' he audibly exclaimed as he finished about the five-hundredth perusal of the familiar lines—'dear lady, she will be all tears and tenderness!'

About a minute after giving utterance to this consolatory reflection, Mr Simpson found himself in Mrs Puckford's presence, who, congratulating him on his punctuality, and pointing to the door of the front apartment said, 'There is only *one* lady there, and you know *her*.' Mr Simpson's heart leaped and thumped, as if desirous of bursting through his green velvet waistcoat. He stepped desperately towards the door, and essayed to turn the brass handle; but so profusely did the bashful man's very fingers perspire, that they slipped round the knob without turning it. The second trial, with the help of his cambric handkerchief, was more successful, and the lover was in the presence of the lady.

Certainly it was she! Mrs Frazer, the hapless Simpson's Mary Fortescue, was there in bodily reality. But the grateful humility, the 'tears and tenderness,' prefigured by the charming note!—Oh Alfred Gray!

The unruffled ease, the calm, reserved politeness with which Mrs Frazer received him chilled his enthusiastic fervour wondrously. His perspiration became a cold one, and in a few moments he felt as if enveloped in coatings and leggings of Wenham-Lake ice. Recovering himself as speedily as he could from the shock of this unexpectedly-chilling reception, Mr Simpson stammered forth something about his extreme good fortune in having obtained a favourable response from so amiable a person, *et cetera*.

'Certainly,' replied the lady, 'I think you are *very* fortunate, Mr Simpson.' And then, by way of saying something particularly civil, and to relieve the modest man's

embarrassment, she added, 'But few men have, like you, sufficient discrimination to discern and appreciate attractions which lie hidden from the merely superficial observer.'

Poor Simpson gasped for breath! He was literally dumbfounded! Here was modest gratitude, to say nothing of 'tears and tenderness,' with a vengeance! Miss Fortescue, with a precarious salary of some twenty pounds per annum, exclusive of bread and butter, was, in her own opinion, conferring a tremendous obligation upon a civic dignitary worth at least twenty thousand pounds, by accepting him for a husband! That was quite clear; and although Mr Simpson was too much in love to deny such a proposition in the abstract, still it was, he thought, scarcely consistent with maiden modesty to state it so very broadly.

Notwithstanding his amazement, Mr Simpson, as soon as he recovered breath, continued, so well had he studied for the occasion, to get out a sentence or two about the superiority of connubial to single blessedness. This sentiment also met with ready acquiescence.

'Oh dear, yes,' said Mrs Frazer; 'I would not have been an old maid for the world!'

'Well,' thought the astonished admirer of feminine reserve, almost doubting the evidence of his ears, 'this is certainly the frankest maiden I ever conversed with!'

A considerable pause followed. Mrs Frazer, seated upon a sofa, played with the luxuriant auburn—really auburn—tresses of her nephew Alfred.

'A handsome boy,' at length remarked Mr Simpson. 'It's a pity that he hasn't different coloured hair!'

'A pity!' exclaimed the lady: 'I think it beautiful! And,' added she, looking the astonished man somewhat sternly in the face, 'I should be well pleased if all our children had hair of the same colour!'

This was a climax! Simpson leaped to his feet as if impelled by the shock of a galvanic battery. 'Our children! Well, after that! But I must be dreaming,' thought the fastidious ironmonger, as he wiped the perspiration from his teeming forehead; 'labouring under some horrid enchantment.'

Dreaming indeed, and to be swiftly and rudely awakened. The door opened, and a gentleman entered, whom Mrs Frazer immediately introduced with—'Mr Simpson, my husband Mr Frazer!'

The blow was terrific! Simpson staggered back as if he had been shot. He glared alternately at the husband and wife for a few seconds; then, pale as his shirt collar, tottered to a chair, and sinking into it, ejaculated with white lips, 'Oh!'

'What is the matter, sir; you look ill!' said Mr Frazer.

The bewildered man made no reply. His brain was whirling. 'Who on earth, then, had he been courting?'

A loud knock at the street door somewhat aroused him. 'My sister, I daresay,' exclaimed Mrs Frazer.

'Her sister! Possibly *his* Mary might be the brunette; and yet— There were but three females present on that fatal evening, besides Mrs Puckford, that he distinctly remembered; and perhaps'— Vain hope! the door opened, and the brunette and two gentlemen entered—Mr and Mrs Holland, and Mr Alfred Gray.'

All illusion was now over. He, Robert Simpson, wealthy tradesman, respected fishmonger, and common councilman, was the betrothed husband of a red-haired damsel with a decided cast, with whom, moreover, he had never exchanged a sentence! His first impulse, as the certainty of his miserable fate flashed upon him, was to strangle Alfred Gray out of hand as the author of his destruction, when fortunately another *rap-tap* arrested his fell intent.

'Miss Fortescue at last!' cried Mrs Frazer, as if announcing glad tidings.

'Oh!' ejaculated the accepted suitor, dropping nervelessly back into the seat from which he had just risen—'Oh!'

He was seized with a sort of vertigo; and what occurred, or how he behaved for a considerable interval, he never distinctly remembered. He was, however, soon seated at

table by the side of his affianced bride, Mr Puckford saying grace. This was the *actual* state of affairs; but poor Simpson's impression at the moment was, that he had been led out to sudden execution by an enormous Jack Ketch with red hair and a frightful squint, and that his friend Puckford was the chaplain reading the funeral service. Gradually, however, his brain cleared, and he grew cooler and more collected. Upon reflection, his position did not appear so *very* desperate. As to Mrs Frazer, all that was of course over, past praying for, and he must dismiss it from his mind as speedily as possible. The lady beside him, who he could see was almost as discomposed as himself, was, he had no doubt, a sensible person—her letter was sufficient evidence of that; and when he had explained the unfortunate mistake that had occurred, which he would by and by take a quiet opportunity of doing, would no doubt release him from an engagement he had never intended to contract. He would, moreover—Simpson was anything but a churlish or ungenerous man—bestow upon her a marriage-portion of, say, four or five hundred pounds, which would doubtless enable her to marry respectably, and thus console her for her present disappointment. Thus philosophising and reasoning, Mr Simpson's spirits, considering the suddenness of the shock he had endured, rallied wonderfully, and he was enabled to address a few words of course to Miss Fortescue in almost a cheerful voice and manner. The lady's answer was uttered in the gentlest, sweetest tones he had ever listened to; and Mr Simpson was a connoisseur in voices. The conversation continued; became general; and the dinner, commenced so inauspiciously, passed off, considering all things, remarkably well. After dinner Miss Fortescue—her friends, who greatly esteemed her, generously drawing forth her powers—appeared to great advantage. Her mind, of a superior order, had been well cultivated, and her conversation was at once refined, sparkling, and sensible. Mr Simpson was surprised, pleased, almost charmed. Music was proposed, and she sang several songs admirably. Mr Simpson determined to postpone his explanation—necessarily an unpleasant one—till the next day, when he would do it by letter. The party separated about nine o'clock; long before which hour it had several times glanced across the ironmonger's mind, that a dislike of any particular coloured hair was, after all, a very absurd prejudice: as to the *cast*, that, he was satisfied, was so slight as scarcely to deserve the name. It had been arranged that they should all dine with the Frazers the day after the next; and as Mr Simpson handed Mary Fortescue into the cab, in which Mrs and Mr Frazer were already seated, she whispered, 'Oblige me by coming on Sunday half an hour before the time appointed: I have something of importance to say to you.' Mr Simpson bowed, and—how could he do less?—raised the lady's hand to his lips. The carriage drove off, and the worthy man was left in the most perplexing state of dubiety and irresolution imaginable. He began to think he had gone too far to recede with honour; and, what was very extraordinary, he felt scarcely sorry for it! At all events, he would not act rashly: Sunday was not far off: he would defer his explanation till then.

Mr Simpson, punctual to his engagement, found Miss Fortescue awaiting him alone. He felt on this occasion none of the violent emotions he had experienced on the previous Friday. His heart, instead of knocking and thumping like a caged wild thing, beat tranquilly in his bosom; yet it was not without a calmly-pleasurable emotion that he met the confiding, grateful smile which beamed on his entrance over the lady's features. Seating himself beside her, he, with respectful gentleness, requested her to proceed with the matter she wished to communicate. She blushing complied, and speedily beguiled him, if not of his tears, which I am not quite sure about, of something, under the circumstances, far more valuable. 'Her family, not many years before in apparently affluent circumstances, had been, by reverses in trade, suddenly cast down into extreme poverty. The only surviving members of it, her mother and youngest sister, had been long principally dependent on her exertions for support.

The assistance she had fortunately been able to render had hitherto sufficed them; but of course, if she married, that source of income must fail; and she never *would* marry—indeed she had never, till surprised by his generous offer, contemplated marriage—but she was even now fully resolved never to do so unless—unless!—Mary Fortescue paused in her narrative, and her timid, inquiring glance rested anxiously upon the varying countenance of her auditor.

Mr Simpson was not made of adamant, nor of iron though he traded in the article; and no wonder, therefore, that the graceful manner, the modest, pleading earnestness, the gentle tones, the filial piety of his betrothed, should have vanquished, subdued him. Her features, plain as they undoubtedly were, irradiated by the lustre of a beautiful soul, kindled into absolute beauty! At all events Mr Simpson must have thought so, or he would not have caught the joyfully-weeping maiden in his arms and exclaimed, in answer to her agitated appeal, 'Unless your home may be theirs also? Be it so: I have, thank God, enough and to spare for all.'

Thus was oddly brought about, and finally determined on, one of the happiest marriages, if Mr Simpson himself is to be believed—and he *ought* to know—that holy church has ever blessed. Should he attain, of which there is every reasonable prospect, the dignity of Lord Mayor, he will, I am quite sure, attribute that, as he now does all fortunate events, to his supreme good-luck in having unwittingly fallen in love with another man's wife!

HURLBUT ON HUMAN RIGHTS.*

ALTHOUGH this cannot be considered as either a complete or a classically-written treatise, it possesses a strong claim upon our notice, in as far as it is an attempt to trace the true natural root of human rights in the human constitution itself. The author, an American lawyer, is an adherent of the doctrines of Gall, which is only saying that he acknowledges a definite mental organisation in man as a department of nature—a doctrine which has led this school to many views of human happiness and destiny now rising into importance, even amongst those who start most at phrenology in its ordinary—we might say vulgar, acceptance.

'The duty of the legislator,' says Mr Hurlbut, 'is simply to conform to natural truth. If Infinite Goodness has ordained the employment of the human faculties for the attainment of happiness, and invited their activity by surrounding them with the means of employment and gratification, human wisdom has but one work to perform—and that is, to reduce the means of happiness to possession according to the natural design. . . . The law is merely *declaratory* as to all natural rights. It does not create, but enforces them. . . . If the law forbid that which nature allows, it restrains human liberty. If it enjoin a duty which nature does not impose, it inflicts an act of tyranny upon man. If it confer a right which nature has not ordained, it robs some one or many of that which it confers, and works injustice among men.' How can we avoid this tyranny? 'Nature outraged appeals from human to divine laws. We have but to know ourselves and our natural relations, and we may be redressed at once.'

'Man,' pursues our author, 'has a right to the gratification, indulgence, and exercise of every innate power and faculty of his mind. The exercise of a faculty is its only use. The *manner* of its exercise is one thing; that involves a question of morals. The *right* to its exercise is another thing, in which no question is involved but the existence of the innate faculty, and the objects presented by nature for its gratification.'

Mr Hurlbut then argues that, as life has been given by the Creator, it is a right as against all but the donor; as God has surrounded man with the means of happiness in conformity with his nature, he has further a

right to happiness. Having a right to happiness, man has also a right to employ the means for its accomplishment which the Creator has conferred upon him in certain innate desires, emotions, and faculties. 'Here is the consummation of man's rights.' There is, however, 'a wide difference between the rational gratification of human desires, and the abusive indulgence of them. There is the same difference as between eating and gluttony—between drinking and drunkenness—between mirthfulness and satire—between justice and vengeance. We are not contending for the abuse, but for the enlightened gratification of man's natural desires; not justifying violence to the laws of the Creator, but struggling for conformity to them. We are seeking to establish the divine origin of human rights, and not the divine origin of human transgressions. Here will be found no apology for vice, but a vindication of virtue.'

It has been a favourite doctrine, that 'the individual substantially bargains with society upon becoming a member of it, by surrendering a portion of his natural rights for certain acquired rights or advantages which the laws of government may confer.' Mr Hurlbut denies this, and shows that, the love of society being one of the natural appetites, it is itself a right, instead of a reason for the surrender of rights. 'The social state emanates from our proper nature, and must not contradict or wrong it. There need be no war between society and the individual man; and tyranny alone declares it.'

Mr Hurlbut regards government—that is, we presume, government as it ought to be—as an expression of the aggregate of morality that may be in a country. A nation composed exclusively of high moral characters, each of whom was a law unto himself, would require no coercion. But, as mankind actually exist, this is necessary. 'A large share of the members composing the social body is constituted of persons in infancy and youth—periods in human life when the passions are strongest, and the intellectual and moral forces have the least control over them. The process of moral and intellectual culture is not perfected, and the advantages of experience and reflection have not yet been attained. Here, then, are defective characters placed in the midst of society, and their restraint is necessary for the safety of its members.'

'Again, as we have seen, the mental constitutions of the different adult individuals of the human race vary indefinitely. All are *alike*, but not *equal*. Uniformity of *kind*, but inequality of *powers*, seems to have been the rule of nature when she formed the character and appointed the destiny of the various members of the human family. It is easy to perceive this disparity in the physical proportions, strength, and appearance of different individuals. Their intellectual and moral powers vary no less, as is established by phrenological science. The same divine hand which made "one star to differ from another star in glory," has made one man to differ from another in the strength and activity of the various instinctive, moral, and intellectual forces of his mind. All men may rise upward from their starting-point, but he whom nature has favoured most may retain his advantage even to the end.' Government, accordingly, becomes necessary, 'in order that there may be imposed upon the actions of each individual in society such moral restraint as is felt by a man having the best moral and intellectual endowment and culture. In other words, government ought to prescribe such limits to individual action as are sanctioned by reason and natural morality.'

'A just government,' adds our author, 'will impose no restraint upon man which his own moral nature and enlightened intellect do not sanction. A good and proper man ought to feel no restraint under government but that of his own enlightened nature. The law of government and the law of his own mind ought to present the same limit to his actions. Government no more directs him than he directs the government. The obligations of the law and those of humanity are to him

* Originally published in the 'Phrenological Journal,' reprinted cheaply by MacLachlan and Stewart, Edinburgh. 1847.

one and the same. If the laws are just, they are the offspring of his moral nature. The obligation of the laws is derived from their moral fitness. His submission, then, is not to man, but to the Creator; not to government, but to himself—to his better, his superior self. If he make a sacrifice, it is upon the altar of his own happiness: he surrenders no right *but the right to do wrong*; he gives up no privilege but the *privilege of erring*. But he had no right to transgress a rule of action prescribed by his superior nature to effect his happiness. He surrenders no positive right, therefore, when he becomes a citizen of a just and free government. He is yet as free as his own true nature ever allowed him to be.

Mr Hurlbut then asserts the right of man to adapt government to the constitution of his nature. 'The next great requirement of humanity is—that the laws shall be general in their scope and application, equal and impartial to all.

'If the aim of all mankind be happiness, and if that depend upon the same rule of intellectual and moral action, then the rule prescribing or limiting that course of action must be the same for all men. Hence the demand of all the enlightened world, that the laws shall acknowledge the equality of all men; not the equality of their physical, moral, or intellectual powers, but the universality and equality of human rights. The doctrine of human equality is not understood by all who assert it. Legal equality exists where the laws create no factitious greatness, confer no partial privileges, and deny no natural rights. So that if the laws be adapted to the constitution of the human mind, and apply to all men alike, or are just and general, affecting all men alike, then all men are equally regarded, protected, and punished by those laws, and legal equality is established. But the inequalities arising from the disparities of men's physical and mental constitutions will still exist. One man will have the advantage of another still; but he will owe it to the laws of his organisation, and not to the laws of man. So far as human legislation has gone, it has left him as it found him—strong, if he were strong before, and weak if he were weak. It has guaranteed the *freedom* of his nature, not the *powers* of it. It has kept his course free from human obstruction. It has conferred neither rights, nor privileges, nor powers—but protected all, and all alike. It is not the fault of the law if he is still weak, as it is not the boast of the law if he is now strong. It made him neither. It took him as he was, and kept him as it found him. The most perfect human laws can claim no higher merit than that they have followed nature; not having conferred the rights of humanity, but guaranteed and defended them; not having bestowed powers upon any man, but having kept him free from obstruction in the exercise of his natural faculties. The boast of the laws should be, that they have not obstructed the true course of humanity; that they have neither advanced nor retarded any man; but that they let him alone to work out his happiness in the exercise of his own true nature, according to its beautiful harmonies, and to attain happiness in accordance with the laws of his mind.'

Our author is strong in his denunciations of that kind of legislation which seeks to confer local and special benefits. It is a kind apparently in great force in his country, and unhappily it is becoming somewhat formidable in ours. He adds—'The legislator properly represents the state, the whole people; nay, humanity itself. He is the guardian of human rights, not the promoter of selfish interests. He should be moved from within, not from without; and if he considered only the justice of general laws, he would act under the impulses of his enlightened sentiments alone. No bribe would tempt his integrity, and his only reward would be the reward of virtue. What dignity, what moral grandeur in his work! He toils now for humanity. Not for particular men, but for mankind he labours; not for the present, but for all time he rears the structure of human govern-

ment, and adorns the temple of justice. He becomes the student of nature, and reverences her laws. He proclaims the rights of man, asserts their sacred inviolability, and keeps the high course of humanity free from obstruction. He is the friend of all rights and the foe of all privileges.'

In descending to details, Mr Hurlbut advances upon ground where we cannot follow him. We would, however, recommend his treatise to the class of minds which desiderate rational inquiry into such subjects.

ADVENTURES IN THE LIBYAN DESERT.

ONE error appears to prevail almost universally respecting the great Deserts of Africa, whose aspect is supposed to inspire melancholy by suggesting ideas of death. This is in direct opposition to our own experience. On many a day have we ridden through these fiery wastes, accompanied by natives of the Nilotic Valley, or Arabs from the borders of the Red Sea; and on these occasions, instead of depression and sadness, have felt the most buoyant cheerfulness, and an inexpressible enjoyment of life. Among all the things around you, there is nothing that can die. You seem to have overstepped the boundaries of mortal existence, and to be moving within the regions of immortality. The sun pouring down its rays through an unclouded sky; the endless expanse of rocks and sand, seemingly rendered transparent by excessive light; and the elasticity, purity, and sweetness of the air, which almost intoxicates you by its exhilarating qualities, render the traversing of the Desert a source of more than ordinary pleasure. That many who have made the trial think differently, is to be accounted for by accidental circumstances. They have been suffering perhaps from ill health, or been rendered dejected by other causes, and have attributed to physical influences what should rather have been ascribed to the condition of their minds.

These, however, are the feelings with which the generality of mankind regard the Desert. History and poetry have peopled their fancy with varied images of terror: whirling sand pillars reaching to the clouds; trackless regions unblest with spring or fountain; an unstable soil in perpetual motion, rolling like the waves of the sea before the wind, and ever ready to submerge the luckless traveller; fierce tribes of men addicted to pillage and murder; scorpions, serpents, pestilential blasts, and death by suffocating heat. But the spirit of enterprise overcomes everything. Trade perpetually conducts caravans across these burning tracts; and curiosity and the love of science from time to time impel single adventurers to despise the sand-storm and the simoom, and to penetrate into these half-fabulous solitudes, in which the venerable traditions of antiquity are found side by side with the offspring of modern ignorance and superstition.

When we were ourselves in Egypt, invincible obstacles prevented our approach to the Oasis of Jupiter Ammon. We have therefore read with deep interest the narrative of Mr Bayle St John,* who was more fortunate than ourselves, since he succeeded in reaching the site of the oracle and the celebrated Fountain of the Sun. He was lucky enough to find at Alexandria three gentlemen, who consented to become his companions; and on the 15th of September 1847, started in the direction of the Arab's Tower. The four travellers were mounted on asses, camels carried their tent and baggage, and they were accompanied by a number of donkey boys and two Moggrebins or African Bedawins. For various reasons, the natives who attend you on such expeditions are greatly given to multiply the dangers of the way. First, ignorance is always prone to the marvellous; second, the persons whom they meet returning from the place to be visited are apt to exaggerate, in order to enhance their own intrepidity; and third, if they

* Adventures in the Libyan Desert and the Oasis of Jupiter Ammon. By Bayle St John. London: Murray. 1849.

are expected to face thirst, fatigue, fevers, robbers, and assassins, it is but fair that their reward should be augmented in proportion to their risks. We were ourselves fortunate enough to meet with Arabs of a better class, who made light of real dangers, and exhibited unusual disinterestedness and forbearance. But they were evidently exceptions to the general rule; at least old Yûnus, who conducted Mr Bayle St John to Siwah, was one of those unprincipled and uncompromising vagabonds who are too commonly found on the frontiers of all countries, more especially in the East.

The region over which they travelled for several days lies along the borders of the sea; and though represented almost by a blank in our maps, exhibits tokens of having been well cultivated and extremely fertile in antiquity. Tanks, wells, cisterns, fountains, and streams of water existing in great numbers, attest the industry of its ancient inhabitants, and justify the reports transmitted to us by historians. But it is now no longer the abode of civilisation. Instead of husbandmen and vine-dressers, merchants and shipowners, we only encounter a few straggling Moggrebins, half shepherds and half thieves, who vanish at the approach of a powerful caravan, but lie in wait and attack stragglers, whom they pillage, and occasionally assassinate.

The party in whose company we are about to proceed to the Oasis having remained two days at Abusir, the Taposiris of Egyptian geography, and made during that time all necessary arrangements, on the 18th of September committed themselves to the perils of the Desert. The sheik who was to be their guide lingered very naturally about his tent, loth to quit his young wife and the command of his clan, however small, in order, for gain, to herd with those whom he regarded as unbelievers, and to brave in their society thirst, pestilence, and famine. Gold of course prevailed ultimately. Having held an affectionate dialogue with his helpmate, and given a great deal of good advice to his son, Yûnus put the diminutive caravan in motion. In this march, though they kept moving till midnight, little way was made. Next day also the spirit of lingering prevailed. The guides were restive; the travellers not yet invested with that authority which habit and distance usually confer on them; and so it was late in the afternoon before they recommenced their march. But with the Arabs little difference is made in travelling between day and night; or rather, we should perhaps say, they prefer the latter, partly through prudence, and partly through an instinctive hankering after that excitement which new scenes, beheld by star or moonlight, everywhere afford. Few objects presented themselves to arrest their curiosity. Close upon dusk they passed the ruins of a fortified camp, and three hours later a Saracenic castle, which, standing amid the white sands on the beach, awakened in their minds many associations of legend and romance. Then, again, about the witching time of night, they spread their mats upon the rocks, enjoyed their pipes, and having further fortified themselves with brandy and water against the cold, slept in their cloaks beneath the open sky. In this way they proceeded day after day, sometimes pausing to examine the ruins which presented themselves on the route, now and then meeting kafilas going down into Egypt to buy corn: here pitching their tent to defend them from the chill blasts of the Mediterranean; and there, overcome by weariness, omitting this precaution, and contenting themselves with the shelter of a rock.

The reader, perhaps, has studied Plutarch, or Quintus Curtius, or some other historian of Alexander the Great. In that case he will remember that the Macedonian conqueror pursued exactly the same route, though with far greater celerity, when he undertook his expedition to Ammon's Temple, in order to strengthen among his followers the belief that he was sprung from a Divine source. In his case there was greater haste than prudence. Four days after leaving the border of Lake Mareotis, the future site of Alexandria, he and his companions were in danger of perishing from thirst,

and were at length saved only by the occurrence of copious showers, which enabled them to fill their waterskins. It was customary, however, in those times always to look for marvels, into which, by a peculiar system of interpretation, they converted whatever they saw. The Macedonians lost their way in the Desert, when a flight of crows making its appearance, guided them through the dangerous passes until they beheld the verdant Oasis expanding before their eyes. In the protracted duration of traditions we put less faith than many others; but from the nomenclature of the Desert, it appears that a wild gorge in the interior still retains the name of the Pass of the Crow, from the fact, perhaps, that that bird is constantly observed there. Mr Bayle St John and his companions lost their way, like the Macedonians, and were extricated from their difficulty by following in the wake of a couple of crows, which, they concluded, were flying towards the Oasis. In the Valley of the Nile there is a particular mountain, which, though several hundred miles from the Mediterranean, is habitually covered with flights of the Damietta duck and other aquatic birds. They doubtless find some favourite food in the Nile at that spot, and therefore proceed thither in numbers, which sometimes render all the rocks in the neighbourhood almost black. The constant presence of the crow in the pass which bears its name, may probably be accounted for in the same way. On the night after this adventure, they found themselves under the necessity of traversing a series of hollows, that remind us of those which intersect the route between Tajara and the Abyssinian Highlands. For some time they had been journeying along a lofty ridge, from which it became necessary to descend by forcing the camels down a narrow and precipitous declivity, full of danger and difficulty. At the bottom they halted three or four hours to wait for the moon, in a position sufficiently romantic and uncomfortable. A north-east wind, cold and cutting, came whistling over the tops of the hills, and seemed to be sucked down into the hollow, where they sat on the chilly stones enveloped in their cloaks, or lay prostrate to catch a brief space of sleep. 'On all sides,' observes the traveller, 'perpendicular masses of rock reared themselves, black and frowning, looking like a vast ruined wall encircling us; whilst overhead the Milky Way spanned the heavens, and all the constellations shone with a brilliancy known only in the East, and, I may add, in the Desert. At about ten the moon lifted up its slightly-depressed orb over the vast pile of rocks, and we were soon again in motion, right glad to escape from so bleak a spot. A few hundred yards ahead, after passing a narrow defile, an extraordinary scene burst upon us. Whilst the irregular line of rocks continued close on our left, we suddenly beheld to the right a great chasm; and beyond, glittering in the moonlight, and clothed by it, no doubt, with yet stranger forms, and more gigantic proportions than nature had afforded, a huge pile of white rocks, looking like the fortifications of some vast fabulous city, such as Martin would choose to paint, or Beckford to describe. There were yawning gateways flanked by bastions of tremendous altitude; there were towers and pyramids, and crescents and domes, and dizzy pinnacles and majestic castellated heights, all invested with unearthly grandeur by the magic beams of the moon, yet exhibiting, in wide breaches and indescribable ruin—evident proofs that, during a long course of ages, they had been battered and undermined by the hurricane, the rain-shower, the thunderbolt, the winter torrent, and all the mighty artillery of time. Piled one upon another, and repeated over and over again, these strangely-contorted rocks stretched away as far as the eye could reach, sinking, however, as they receded, and leading the mind, though not the eye, down to the distant plain below. In vain did our eager glances endeavour to ascertain the limit of the descent to which we had so abruptly come. The horizon was dissolved in a misty light; but stars twinkling low down, as if beneath our feet, showed that we were about to abandon, once for all, the great

range, along the summit of which we had toiled during so many nights and days.

'A gorge, black as Erebus, lay directly across our path; and we had to make a detour to the left in order to reach the place where it is practicable for camels. Here there was a pause; for again the generally patient beasts hesitated, and moaned, and backed, and drew up their long necks, and huddled together; as well, indeed, they might. The declivity was steep, and filled with heavy shadows. Precipices hemmed it in on every side; and here and there we could distinguish a huge fragment of rock standing like a petrified giant in the way, and catching perchance on its bare scalp some stray beams of sickly light. But down we did go; the camels, when once the impetus was given, carried forward by the weight of their burthens, yet keeping their footing with admirable sagacity; we, almost in the same manner, each leading by the halter his long-eared monture. In truth it was a picturesque scene: partly lighted by the slanting rays of the moon, partly buried in broad masses of shade, and only requiring a few Bedawin heads appearing from behind the jagged rocks, and the flash of a gun or two, to make it worthy of the pencil of *Salvator Rosa*. According to our guides, some probability existed of such an illumination taking place; and our imaginations were thus supplied with materials to work on, as in the solemn hush of that romantic night we scrambled, slid, staggered, almost rolled down.'

Having thus reached the bottom of the gorge, they there bivouacked for the night; and next day, after the usual quarrels and altercations with the guides, moved along the base of a series of white and red cliffs, passed the Hill of the Cannons, and traversing an exceedingly rough and rocky tract of country, entered upon a plain, where they discovered the first signs of vegetation since leaving Alexandria. By these they were inspired with such feelings of pleasure, that although they consisted of nothing but a number of huge thorns, they could not, as the traveller expresses it, take off their eyes from the green of their leaves. They were now drawing near to what, in the poetical phraseology of the Arab, is called the Gates of the Milky Mountains. Their Bedawins always took care to keep them in a state of perpetual expectation, and indeed would themselves appear to have looked forward hourly to the occurrence of some unfortunate disaster. Already several times had they been surrounded by the elements of strife, and only escaped what might have proved a fatal encounter by the prudence of the Cyclops who had taken them under his protection. Now, however, danger seemed to approach in a formidable shape. Weariness and want of sleep had sharpened their powers of apprehension. The heat was terrific. They were standing in their tent faint and dispirited, when they descried some objects ahead, which created the usual interest and excitement. 'Pipes were laid aside and guns taken up. For aught we knew, the *Manseer* might be coming down upon us. It soon appeared, however, that a large caravan was approaching; still there might be cause for alarm. To what tribe did these strangers belong? If hostile to the *Waled Ali*, a collision might take place. Presently we beheld a number of armed men advancing ahead of their camels. Our tent, no doubt, had attracted their attention, and roused their curiosity, perhaps excited their alarm. They came on cautiously, as towards an enemy, with their muskets half presented. One of them at length detached himself, and drew near us, keeping a little out of the direct line, possibly to allow his companions an opportunity of firing in case of necessity. He was a strapping giant, above six feet high, with a fine open countenance, high Roman nose, and reddish complexion. I could not help admiring the appearance of this young lion as he crept along, slightly bending, with his gun thrown forward, gazing at us with eyes in which distrust and curiosity were amusingly blended. As he approached, *Yûnus*, who had more of

the tiger in his composition than the lion, went with the same precautions to meet him; and we heard them both, with the infernal suspicion perhaps necessary in the Desert, bring their weapons to full cock ere they came to close quarters. A moment afterwards, however, hand-shaking and embracing succeeded; and the whole party coming up, our little encampment was soon filled with a set of ruffianly-looking young fellows, with skull-caps, that had been white, pulled nearly over their eyes, with brown blankets wrapped closely round them, and tucked up in marching trim, and shoes of various colours in various degrees of dilapidation. Many had daggers and pistols in their belts, from which were suspended shot and powder-purses, with an amulet or two; and all were armed with long guns, some with the addition of bayonets.

'Now began a prodigious number of mutual inquiries, all in cut-and-dried phrases, after one another's health, each of the new-comers thinking it necessary to ask at least ten times of each of our companions how he did. The most satisfactory answers were invariably given; but the anxiety and solicitude of these kind people were not easily soothed. They seemed really afraid that some peculiar source of sorrow might be suppressed through mere delicacy. Exquisite display of the finest feelings of the human breast! I wish I had not detected certain covetous glances at various articles of property, and that this affectionate meeting had terminated in any other manner than a general cry for drink, and a rush at our water-skins. They were but ill supplied for their journey. Improvidence, or poverty, or both, had presided over their arrangements. I could only see about five small *kûrbehs* distributed among the thirty or forty camels that crowded past laden with heavy bags of dates. However, the thirsty souls were not unreasonable; they were made to understand that we could not satisfy the wants of the whole party, and we only spared two or three draughts of water to those that seemed the heads of this band of youths, among whom he who had advanced to reconnoitre was the chief. We received in return for our limited civility a small pile of fresh dates of excellent quality, and the information that there was no fever reported at Siwah; the party, which came from some point on the coast to the west, had only been as far as Garah, where they had obtained their winter's provision of dates. They were good-natured, but rough customers. I should not have liked to have encountered them beyond the range of *Yûnus's* bland eye.'

They now passed through the little Oasis of Garah, where they were well received, and reached the great valley, which, for its extreme beauty, was denominated by the ancients the Island of the Blessed. The character of its inhabitants, however, had greatly changed since those days. Instead of being hospitable and genial, they have now degenerated into a horde of savages, fierce, bigoted, vindictive, and disposed to thrust the stranger from their doors: for the honour of the children of Ishmael, it should be stated that they were not Arabs, but descended from the Berber race, which would appear to be scattered under various names over all the eastern division of the Sahara. Out of consideration for the Bedawin who brought them to Siwah, they were granted a conditional permission to remain; taking advantage of which, Mr St John explored the valley in its whole length and breadth, visited the ruins of Ammon's Temple, the Fountain of the Sun, the Hill of Tombs, and the margin of those salt lakes which, encircled with a glittering snow-white rim, connects the Oasis with the Desert: what still remains of natural beauty and fertility may be said fully to justify the descriptions of the ancients. Everywhere you behold magnificent palm groves which produce valuable dates, gardens of superb pomegranate-trees, and apricots and bananas, equalling in richness those of Boretta. The olive also, as in El-Fayoom, interposes its dusky verdure among the clumps of brighter green, and large expanses of bursin or Egyptian clover, interspersed with brooks

and rills, separate the orchards and the groves. The chief town, Siwah-el-Beber, constructed with blocks of rock-salt, rises in a castellar form, tier above tier, to the height of one hundred and twenty feet, and glitters like a pyramid of tinted snow in the sun. But into this the strangers were not permitted to enter. In these were the women of the Berbers, whom it was not permitted to any other eyes than those of the Muslims to behold. Fearful this rule might accidentally be broken, the natives desired to terrify away the travellers as speedily as possible; and without doubt succeeded in thoroughly disgusting them. They fixed, therefore, upon an early day for their departure; and the occurrence of the following scene may be supposed to have hastened their movements:—The travellers are seated in their tent, having made all the necessary preparations for their departure, and are discussing in a friendly manner as to whether their evening's entertainment should consist of grog or tea. 'The vote having been given for the latter, Derweesh and Saad, who had been heard through the canvas astonishing the weak minds of the Bedawins by accounts of the "fast" life they led in Alexandria, received orders to light the fire, to boil the water, and to skim it; for at Siwah a thick scum always rises to the surface as soon as it begins to warm. Our kettle was nothing but a tin can, employed for a variety of purposes; none, however, more important than this. Well, a cheerful blaze was soon lighted up, and the two lads crouched down to it, spreading out their blue shirts to keep off the wind that came sweeping along as usual, howling amidst the palm groves, and threatening at every moment to bear away our little tent. By this flickering light we could discover our patient donkeys still weary, after four days' rest, hanging their noses in melancholy companionship together close along the wall of the plantation near at hand; and the surly Yûnus casting ever and anon towards us a sinister glance from his remaining eye; and the good-tempered Wahsa showing his white teeth; and old Saleh mumbling and shaking his long thin beard—all three crowded round some mess of their own making; and we could dimly see the camels at no great distance, either holding their heads erect, or working their way here and there in spite of their fettered legs; and in the background the huge dark mass of the town of Siwah rising in sullen silence against the sky. . . . Our conversation that evening was not of long continuance. One by one we stretched out to repose in anticipation of the labours of the next day, and a general silence soon prevailed. The fire had gone out, our guides and attendants had sought shelter from the wind in little nooks formed by the zembeels and bean bags, and the whole encampment would probably have been soon wrapped in slumber, had not the report of a gun close at hand among the palm-trees aroused us. It was pretty evident that some evil-disposed person had crept up behind the wall, and taken a shot at the Nasâra. Luckily he could not aim, and was too cowardly to try his fortune a second time. However, Mr Lamport, who was the first to understand what was going on, put out the lantern at once, for there was no knowing how many ruffians were prowling about anxious to make a target of us; and we quietly waited events, making our preparations in silence to resist any attack unless of overwhelming numbers. Presently a crowd of people were heard coming with loud cries from the direction of Siwah, and we could soon distinguish the name of Yûnus several times repeated. It appeared that his friends within the city had heard the report, and being aware of the feeling that existed against us, because we were Christians, and against him for bringing us, had come out to see what was the matter. They expressed great sorrow at what had taken place, and some of them resolved to remain all night in the neighbourhood of the tent. We now understood that there was a large party at Siwah, who, if they had their will, would massacre us at once; and unpleasant reports reached us that twenty-four individuals had leagued together

to waylay us on our return towards Garah. However, sleep being absolutely essential, we arranged our carpet-bags so as to protect us as much as possible in case half-a-dozen slugs should intrude into the tent, and soon forgot the incivility of which we had been the objects.' The return to Egypt was accomplished in the utmost haste. Some fresh ground was gone over; but the novelty, and therefore the interest of the Desert, had been exhausted. Compelled to live on bad food, to drink bad water, and to sustain the annoyance and everlasting quarrels and bickerings with their guides, it was with unusual pleasure that, after a journey of nearly forty days, they found themselves once more in Alexandria, amid the comforts of a comparative civilisation, and in the midst of genuine friends, who had almost given them up for lost, and were engaged in urging the pasha to send out a body of horse in search of them.

QUADRUPEDS OF NORTH AMERICA.*

WHOEVER has read the 'Ornithological Biography,' one of the most delightful of all contributions to scientific literature, will hear with great interest of the appearance of another work of the same kind, and by the same author, although on the present occasion Audubon has had the assistance of Dr Bachman. The non-scientific reader will perhaps be startled at the outset by the title '*Viviparous Quadrupeds*,' and inquire what animals of the kind are *oviparous*. The expression, we presume, is intended to distinguish quadrupeds, popularly so called, from the four-footed *oviparous* reptiles; but we doubt whether, in its general application, it would answer even this purpose, since some of the lizard tribe (though possibly not American varieties) are *viviparous*—that is to say, the young are born alive, the eggs being hatched within the body.

This is the first attempt—except those made by early writers, when the number of species known was inconsiderable—to give a complete description of the quadrupeds of America; and the authors have been compelled, in the course of their researches, to consult the various scientific journals for the information scattered throughout the papers both of American and European zoologists. They have themselves described, however, not from stuffed specimens, but from the living or recently-living animal; and in the department of 'habits' more especially, their information appears pretty generally to have been drawn either from their own observation or other original sources. The book, therefore, independently of its scientific importance, possesses a strong interest for the general reader; vast numbers of whom, in these comparatively well-informed days, have at least that smattering of science which enables them to obtain instruction from entertainment.

We are told in the introduction that the history of the habits of the quadrupeds was the production of both authors; but occasionally there occurs a passage which is Audubon all over. Who can doubt from what pen comes this description of an assembly of flying squirrels? 'We recollect a locality not many miles from Philadelphia where, in order to study the habits of this interesting species, we occasionally strayed into a meadow containing here and there immense oak and beech-trees. One afternoon we took our seat on a log in the vicinity to watch their lively motions. It was during the calm warm weather peculiar to the beginning of autumn. During the half hour before sunset nature seemed to be in a state of silence and repose. The birds had retired to the shelter of the forest: the night-hawk had already commenced his low evening flight, and here and there the common red bat was on the wing; still, for

* The *Viviparous Quadrupeds of North America*. By John James Audubon and the Rev. Dr Bachman. Vol. i. London: Wiley and Putnam.

some time not a flying squirrel made its appearance. Suddenly, however, one emerged from its hole and ran up to the top of a tree; another soon followed; and ere long dozens came forth, and commenced their graceful flights from some upper branch to a lower bough. At times one would be seen darting from the topmost branches of a tall oak, and with wide-extended membranes and outspread tail gliding diagonally through the air, till it reached the foot of a tree about fifty yards off, when, at the moment we expected to see it strike the earth, it suddenly turned upwards and alighted on the body of the tree. It would then run to the top, and once more precipitate itself from the upper branches, and sail back again to the tree it had just left. Crowds of these little creatures joined in these sportive gambols; there could not have been less than two hundred. Scores of them would leave each tree at the same moment, and cross each other, gliding like spirits through the air, seeming to have no other object in view than to indulge a playful propensity. We watched and mused till the last shadows of day had disappeared, and darkness admonished us to leave the little triflers to their nocturnal enjoyments.

These little creatures enjoy life only during the night. They become tame in a few hours, and show little disposition to change the residence that is allotted to them. One of them, with its young family, was taken from a hollow tree, carried home in the finder's hat, and placed in a drawer with a chink open to admit the air. The mother, however, made her escape, and some fears were entertained for her progeny, as they showed no disposition to eat. They seemed to thrive, notwithstanding, and were always in good order—a circumstance that was at length accounted for by the discovery, that the mother sacrificed her gambols on the trees to her natural affection, and, stealing in by the window, passed the night with her offspring.

The migration of the northern gray squirrel towards the east is curious. They are stopped neither by mountains nor rivers, but march on in vast troops, devouring the corn and wheat wherever they pass, and filling the farmer with dread. As on ordinary occasions the squirrel has an instinctive dread of water, some stories have been invented to account for their being able to cross rivers. One of these, which is believed by many, is that they float across on a piece of bark, raising their broad tails by way of a sail! Our authors, however, saw them swimming, and some so unskilfully that they were drowned; while others were fain to rest on the long steering-oar of the boat.

The squirrel is preyed upon by many animals, but more especially by the snake; and the common mode of accounting for so agile a creature being caught by its sluggish enemy, is to suppose that it has been 'fascinated,' or paralysed by its deadly glance. Our authors, however, contend that there is no fascination in the case, but that the squirrel is either transfixed with horror, or induced to approach by simple curiosity. As an instance of the latter feeling, they mention having seen one come down from a tree to inspect a beautiful little scarlet snake, not much larger than a pipe stem, and scarcely able to master a grasshopper. But this, we submit, is no case in point; for the squirrel, like other animals, is doubtless well acquainted with the strength of his enemies. We once witnessed an instance of what very much resembled fascination in the case of a bird. It was a canary, so admirable a songster, that when we put him out in our balcony in London, he usually gathered a crowd of listeners in the street. There was in the house at the same time a Tom-cat, as black as night, a quiet and sagacious old gentleman, but to whose appearance the bird could never be reconciled. Tom frequently crept up to its cage, and stole its bread and cake; but although he never made the slightest attempt at personal violence, the canary on such occasions always fluttered and squeaked as desperately as if it apprehended murder. With us it was on such good terms that it would come upon our finger, to be taken out of

the cage for a fly about the room; but on one unfortunate day a third individual was present unobserved. The canary flew up to a corner of the ceiling, and at that moment we caught a view of the head of the Tom-cat protruded from beneath a table-cover which had concealed him. The discovery was made too late; for at the same instant the canary, after a flutter or quiver, darted right down into the mouth of the animal, and was crushed to death with one movement of his jaws.

Tom's American relations in a wild state—the Indians of the cat race—are represented in these pages as rather interesting in their character. They have all the external marks of ferocity, and but little of the reality: they look claws, but use none—but when flight becomes hopeless, they turn to bay, and grapple in infuriated despair with either man or dog. They are sometimes hunted with packs of foxhounds, and on these occasions the wild-cat exhibits 'an exercise of instinct, so closely bordering on reason, that we are bewildered in the attempt to separate it from the latter. No sooner does he become aware that the enemy is on his track, than, instead of taking a straight course for the deepest forest, he speeds to one of the largest old fields overgrown with briery thickets in the neighbourhood; and having reached this tangled maze, he runs in a variety of circles, crossing and recrossing his path many times; and when he thinks the scent has been diffused sufficiently in different directions by this manœuvre to puzzle both men and dogs, he creeps slyly forth, and makes for the woods, or for some well-known swamp; and if he should be lucky enough to find a half-dried-up pond, or a part of the swamp on which the clayey bottom is moist and sticky, he seems to know that the adhesive soil, covering his feet and legs, so far destroys the scent, that although the hounds may be in full cry on reaching such a place, and while crossing it, they will lose the track on the opposite side, and perhaps not regain it without some difficulty and delay.'

This is indeed a curious part of the instinct of animals—the knowledge they have that they are betrayed by their scent. On other occasions the wild-cat is described as making a desperate, and therefore temporary effort, to get some distance ahead of its pursuers, when, instead of continuing to run on, which it feels would be unavailing, it loses time, as an inexperienced looker-on might suppose, by traversing repeatedly from end to end the trunk of a fallen tree. It then makes a sudden spring, and leaps, without touching the ground, into the branches of a neighbouring tree; and climbing to one of its highest forks, awaits, closely squatted, the arrival of its enemies. The result usually is, that the dogs, confounded and wearied out by the scent on the tree, which they can trace up and down, and down and up, a dozen times over, but not a foot farther along the ground, are soon at fault, and the huntsmen calling them off from the hopeless search, give up the chase.

A wild-cat hunt of this kind, but with a different termination, is described in our authors' best manner. The cat is for a time difficult to find, but at length some of the more experienced dogs begin to give tongue, and onward goes the trail through a broad marsh. "He will soon be started now!" "He is up!" What a burst! you might have heard it two miles off—it comes in mingled sounds, roaring like thunder, from the muddy marsh and from the deep swamp. The barred owl, frightened from the monotony of his quiet life among the cypress-trees, commences hooting in mockery, as it were, of the wide-mouthed hounds. Here they come, sweeping through the resounding swamp like an equinoctial storm—the crackling of a reed, the shaking of a bush, a glimpse of some object that glided past like a shadow, is succeeded by the whole pack, rattling away among the vines and fallen timbers, and leaving a trail in the mud, as if a pack of wolves in pursuit of a deer had hurried by. The cat has gone past. It is now evident that he will not climb a tree. It is almost invariably the case that where he can retreat to low swampy situations, or brier patches, he will not take a

tree, but seeks to weary the dogs by making short windings among the almost impassable brier patches. He has now been twisting and turning half-a-dozen times in a thicket covering only three or four acres—let us go in and take our stand on the very trail where he last passed, and shoot him if we can. A shot is heard on the opposite edge of the thicket, and again all is still; but once more the pack is in full cry. Here he comes, almost brushing our legs as he dashes by and disappears in the bushes, before we can get sight of him and pull trigger. But we see that the dogs are every moment pressing him closer, that the marauder is showing evidences of fatigue, and is nearly "done up." He begins to make narrower circles; there are restless flashes in his eye; his back is now curved upwards; his hair is bristled nervously forward; his tongue hangs out; we raise our gun as he is approaching, and scarcely ten yards off—a loud report—the smoke has hardly blown aside, ere we see him lifeless almost at our very feet: had we waited three minutes longer, the hounds would have saved us the powder and shot!

A fox is described as hunting on his own account, and watched in his operations by one of our authors, who, after the animal has been successful in capturing a bird, puts his gun instinctively to his shoulder. He is stopped, however, by the reflection, that the marauder had only obeyed an instinct of his nature, and obtained a meal in the prescribed way; that he killed only a single bird, instead of murdering, as man would do were he able, the whole covey; and that he took no wanton pleasure in the destruction of his prey, or in exhibiting his spoils to his companions, but was perfectly content to satisfy his hunger. This is good reasoning, and well befitting a philosopher, as contradicting distinguished from a mere sportsman.

The fox is frequently hunted in his turn, and on such occasions displays a sagacity which is altogether wonderful. 'The late Benjamin C. Yancey, Esq. an eminent lawyer, who in his youth was very fond of fox-hunting, related the following:—A fox had been pursued near his residence at Edgefield several times, but the hounds always lost the track at a place where there was a foot-path leading down a steep hill. He therefore determined to conceal himself near this declivity the next time the fox was started, in order to discover his mode of baffling the dogs at this place. The animal was accordingly put up and chased, and at first led the hounds through many bayous and ponds in the woods, but at length came running over the brow of the hill along the path, stopped suddenly, and spread himself out flat and motionless on the ground; the hounds came down the hill in pursuit at a dashing pace, and the whole pack passed, and did not stop until they were at the bottom of the hill. As soon as the immediate danger was over, the fox, casting a furtive glance around him, started up, and ran off at his greatest speed on his "back track."

An anecdote is given of a wolverine, which, on getting his leg into a trap, carried off the whole concern, weighing eight pounds, a distance of six miles. This he did, not by dragging the trap after him, which the snow and hanging branches of the trees would have rendered the next thing to impossible, but by taking it up in his mouth, and running on three legs.

We are not aware that an opportunity has frequently occurred of observing a hibernating quadruped in his state of torpidity; but this occurred in the case of a ground hog, or wood-chuck, which was kept in a house as a pet. Its chamber was a large box supplied with a bed of hay, and on the approach of winter this was placed in a warm corner of the room. The instinct of the animal, however, was not to be deceived. The time for its winter sleep had arrived, and entering the box, it arranged its couch with care, and became torpid. After six weeks had passed, it was taken out of the box, and found to be inanimate, and as round as a ball, its nose pressed upon its abdomen, and covered with its tail. It was rolled over the carpet again and again

without effect; but after being laid down for half an hour close to the fire, it slowly unrolled itself, raised up its nose, and looked round in bewilderment. It was now replaced in its box, when it went to sleep as before, and so remained until spring.

The habits of the Florida rats in America, as regards their habitations, are highly curious. In some places they burrow under stones and ruins; in others they remain in the woods; in others, in swampy situations, they pile up a cone of dry sticks; and in others still, they make their nests in the forks of lofty trees. 'About fifteen years ago, on a visit to the graveyard of the church at Ebenezer, Georgia, we were struck with the appearance of several very large nests near the tops of some tall evergreen oaks (*Quercus aquaticus*); on disturbing the nests, we discovered them to be inhabited by a number of Florida rats, of all sizes, some of which descended rapidly to the ground, whilst others escaped to the highest branches, where they were concealed among the leaves. These nests, in certain situations, are of enormous size. We have observed some of them on trees, at a height of from ten to twenty feet from the ground, where wild vines had made a tangled mass overhead, which appeared to be larger than a cart-wheel, and contained a mass of leaves and sticks that would have more than filled a barrel.'

Of all the animals described in the present volume, the skunk is the most curious, and the most detested. It has claws and teeth, but is too timid to use them, and is so slow of foot that it might seem to be completely in the power of its enemies; but the most ferocious of these, while still at a distance of many feet from their prey, turn tail, and fly, or run their noses into the earth, and roll and tumble, as if in convulsions. As for a man, he usually runs from the little animal, which is only seventeen inches long, as if a lion were at his heels. The means furnished by nature for this creature's defence, is simply a liquid, contained in two small sacs on each side of the tail, and which it is able to discharge at its enemies to a distance, as measured by our authors, of fourteen feet. It takes an unerring aim, saluting a dog in the face and eyes, and setting the animal distracted with pain and inexpressible loathing. So offensive and so permanent is the odour of this liquid (which has nothing to do with the ordinary excretions), that clothes once sprinkled with it are useless. No washing, no perfume, not even burying them for a month in the earth, has the slightest effect. The following is an account of the adventure of one of our authors with a skunk:—'It happened in our early schoolboy days that once, when the sun had just set, as we were slowly wending our way home from the house of a neighbour, we observed in the path before us a pretty little animal, playful as a kitten, moving quietly along: soon it stopped, as if waiting for us to come near, throwing up its long bushy tail, turning round and looking at us like some old acquaintance. We pause and gaze: what is it? It is not a young puppy or a cat; it is more gentle than either: it seems desirous to keep company with us, and, like a pet poodle, appears most happy when only a few paces in advance, preceding us, as if to show the path. What a pretty creature to carry home in our arms! It seems too gentle to bite; let us catch it. We run towards it; it makes no effort to escape, but waits for us; it raises its tail, as if to invite us to take hold of its brush: we seize it instantly, and grasp it with the energy of a miser clutching a box of diamonds; a short struggle ensues, when—faugh! we are suffocated; our eyes, nose, and face are suddenly bespattered with the most horrible fetid fluid. Imagine to yourself, reader, our surprise, our disgust, the sickening feelings that almost overcome us. We drop our prize, and take to our heels, too stubborn to cry, but too much alarmed and discomfited just now to take another look at the cause of our misfortune, and effectually undeceived as to the real character of this seemingly mild and playful little fellow.'

It would be easy to multiply extracts of this kind;

but the above are sufficient to show the style and character of the book. Scientific readers will find in it information of more value, to which it is not our province to direct their attention.

SUCCESSFUL INDUSTRY.

At the seventh annual meeting of the London Early-Closing Association, held on Tuesday se'nnight, at which the Marquis of Blandford presided, Mr Williams, M. P., pithily pleaded the cause of early shop-shutting by a reference to his early life. He said—'No man in England had felt the disadvantages of late shop-shutting more than himself. He came to London at the age of fourteen, and the first situation he obtained was in a draper's house, where he served twelve months for L.6. At the end of the twelve months his first ambition was—leaving Wales as a poor boy—to be enabled to do something for his mother. (Cheers.) He saved just enough to buy her a pound of tea, for which he paid 8s. (Hear and cheers.) He used to sleep under the counter, and he had no doubt that many whom he addressed slept under the counter, if they were not too proud to own it. (Laughter.) He then moved from the situation where he had wages, to one at the west end, where he had a salary. (Laughter.) There was a difference between wages and a salary. (Laughter.) His great prayer and aim was to do his duty to his employers, and assist his poor relations in Wales. (Cheers.) He used to get up at six o'clock in the morning, and go to bed at two o'clock the next morning. Many a time had he sat down on his bed to rest himself for a moment, before he undressed, and many a time had he found himself, at six o'clock in the morning, almost as tired, with his clothes on. (Hear.) Was there any state of slavery so bad as that? He had to bear with it, for he had no one that would give him twenty shillings to support him until he got another situation. The only time he had to read was between two and six o'clock in the morning, and he sometimes did so by the light of the gas in the window, until he was discovered, and censured for so doing.'

THE CHANCES IN MATRIMONY.

The Belgian statistical documents, which have been kept with great care in that country, show that the annual number of marriages, regard being had to the increase of the population, maintains constantly the same proportions—nay, that it varies less even than the number of deaths; although this latter event is not, like the former, an act of the will. But more than that, not only the number of marriages continually recurs, but the proportion of bachelors marrying spinsters, bachelors marrying widows, widowers and spinsters, widowers and widows even, perpetually reappear; and these last unions, however few in number, manifest a remarkable identity, of which there exist few stronger instances in statistics. Indeed the harmony of ages is so general, that it almost seems as if severe penalties had been appended by law to marriages between persons of disproportionate years. These instances, standing prominently out from a long series of studies, induce M. Quetelet to conclude that the *liberum arbitrium*, as far as social phenomena are concerned, is restricted within very narrow limits; that, in point of fact, indisputable as it may be for each individual, it is effaced, and remains without any perceptible effect when the observations embrace mankind in the mass; for man is as sociable on the one hand as he is selfish on the other—he voluntarily renounces a great part of his individual caprices, pleasures, feelings, and liberty, in order to form an aliquot part of aggregate society, the circle, the city, or the nation to which he belongs.—*Prospective Review*.

FAITHFUL SHEEP-DOG.

We have heard an anecdote connected with the Inverness floods which is worth recording. The scene is the river Conon, near to Brahan Castle. In an island, about 200 sheep were pasturing—so that when the swelling river changed the dry land into a deep swamp, all were in imminent danger of being drowned; there was no possibility of reaching them; and in this dilemma a faithful colly was sent for, and told that the sheep required his aid. The hardy beast soon breasted the billows, entered the island, and tearing down a portion of the enclosure that penned in the flock, he drove them to the only safe spot, keeping watch and ward round them for two days, until the river subsided low enough to make the fords passable.—*Inverness Courier*.

THE MODERN DANÆ.

IN vain! in vain! it will not be,
There is no answering sign;
Unheeded thy heart's worship lies
On that fair idol's shrine.
She sees not, boy, thy graceful form,
Thy frank and manly face,
Where all that's bright, and pure, and good,
Hath left its holy trace.
She does not hear the voice of song
That thrills to every heart,
And bears the very sense away
By its resistless art.
She does not feel, when all on fire,
The poet's fancies pour,
In bursts of eloquence divine,
From the mind's varied store.
Nor worth, nor beauty, genius, fame,
Can move that maiden's soul:
She mocks Affection's sacred ties,
And scorns soft Love's control.
A second Danæ all confined
Within her brazen tower
Of worldly selfishness and pride,
She owns but one high power.
And he, fond boy, who seeks to win
That heart of earthy mould,
A second Jupiter must come
To woo in showers of gold.

MEMOIRS OF FRANCIS HORNER,

WITH SELECTIONS FROM HIS CORRESPONDENCE.

[PUBLISHERS' NOTICE.]

IN 1843, the Memoirs of the lamented FRANCIS HORNER were given to the world under the able and appropriate editorship of his brother,* Mr Leonard Horner. The work having latterly gone out of print, it occurred to us that a new edition, in a form which would render it accessible to a large portion of the community, would be favourably received. With the approval of Mr Horner, the present edition has therefore been prepared.

The career of Francis Horner is one of the most exemplary which biography can present to the young. It is that of a man who, without aristocratic birth, fortune, or even dazzling genius, had made for himself a great unsullied name, and was treading the sure path to high station, in which he was stopped only by an untimely death. The great importance of his example lies in this, that the secret of his success rested in qualities more or less at the command of every one—diligence, steadiness, independence, and integrity—and his biography teaches more emphatically than almost any other that has been written, how much our lot in life is of our own making. In troubled times, the young political aspirant may learn how to steer his course by this example: he will see how ardour, courage, and independence may all tend to good purposes when they are regulated by reflection, firmness, and integrity, and he may learn how the boldest and most original political views may be followed out with safety and advantage.

In producing this work in a condensed form, it was necessary in some degree to re-arrange its parts—to unite together passages originally dispersed, which served to explain each other, and to discard much that had a mere temporary or local interest. It was necessary here and there to insert remarks or brief narratives, serving as a means of cementing, as it were, the different parts together. But essentially the plan of the original work has been adhered to in this important feature, that Horner himself is made, through his journal and his correspondence, the teller of his own history.

W. AND R. C.

* Memoirs and Correspondence of Francis Horner, M. P. Edited by his Brother, Leonard Horner, Esq., F.R.S. 2 vols. 8vo. London: Murray, 1843.

USE AND ABUSE OF MEDICINE.

BY A PHYSICIAN.

THE English public attach too much importance to the mere administration of medicine. They appear to think that for every complaint medicine is to be taken; that the chief, if not the only duty of a medical man, is to prescribe and administer drugs; and that medicine is the sole cause of every change in a disease, whether for better or worse, which follows the use of it. In all this there is much error. An illustration will at once show what is meant, and prove its truth. Take a case of indigestion. The disease may have arisen from excess or impropriety in eating or drinking, or from some other bad habit continued through ignorance, necessity, or self-indulgence. In the majority of such cases, if the cause be removed, the suffering will cease. If the medical man, however, were to content himself with pointing out the cause, and directing the patient to avoid it, and were to prescribe no medicine, such is the inveterate expectation of physic, that most patients would go away dissatisfied. Medicine is therefore given, *together with directions to avoid the injurious habit*; the patient recovers, and the drugs get the credit. Too often the cause is repeated, and the same process of cure is again and again submitted to. It is not to be supposed that *all* cases of indigestion belong to the class from which the above example is taken. There are some in which the cause may not admit of being removed; those arising from mental anxiety, for instance; others in which, owing to great debility in the stomach, the suffering is very disproportionate to the offence. In both these medicine may be legitimately and usefully employed to *palliate* suffering, until time can be gained for effecting a more radical cure by other means.

It is important to know that there is great power in the human body to throw off disease, and to restore health, without any help, when the cause is temporary, and has ceased to operate. This power alone is sufficient to cure many diseases, not merely the trifling, but even in many instances the more severe ones. Suppose a cold has been taken, and the subject of it is a little feverish. In the mass of cases the patient will get well without any medical assistance. The duty of the medical man, if called in, is to find out whether there be any serious disease: if there be, he will treat it; if not, little further may be needed. He may *palliate* suffering, and may *shorten* the illness—both good things; but nature would effect a cure without him. Again, suppose a case of measles, scarlet fever, or typhus fever. The disease has arisen from a contagious poison, and it will run a certain course. Some cases are very mild. In these the medical man has little to do but to keep the patient out of harm's way, and to be ready to act if the case becomes more severe. Each

of these diseases is liable to become complicated with serious internal changes, or with a dangerous failing of the strength. A case that is mild to-day may be severe to-morrow. The prompt attention of a professional man in these circumstances may save life. If it were known, however, beforehand that the case would be mild, it might be safely left to nature. In the case of typhus, it will be important to find out the *cause* of the attack, with a view to its removal, or to the removal of other members of the family from the sphere of its influence. Suppose, lastly, a case of *erysipelas*. It may be the most trifling or the most serious disease imaginable. Many cases are so mild, that they might very safely be left to themselves; others are so severe, as to baffle the highest professional skill. How often do we find the cure of the trifling cases ascribed wholly to the drugs taken, whether from the hand of a regular or an irregular practitioner; whether in the ordinary doses of the Allopath, or in the inconceivable dilutions of the Homœopath.

The habit of looking to physic for everything, and of taking it to excess, prevails much more in England than in Scotland; and the difference depends very much upon the difference in the circumstances of the medical profession in the two countries. Originally, the English apothecary was a dispenser of medicines only, and not a medical practitioner: he compounded physicians' prescriptions. About the close of the seventeenth century, the apothecaries in London and its neighbourhood began generally to prescribe, as well as to dispense medicines.

The encroachment was resisted by the College of Physicians; and from a pamphlet published in 1724, defending the apothecaries, it seems that they only claimed permission to prescribe for the poor. Even so lately as 1812, the parties who were instrumental in obtaining the present Apothecaries' Act express the opinion, 'that the management of the sick should be as much as possible under the superintendence of the physician.' Since 1815, the course of instruction, and the examinations instituted by the Apothecaries' Company, have been gradually improved; so that the apothecary of the present day, instead of being ignorant of physic, as his prototype was, is a well-educated medical man; and, in point of attainment, may fairly rank with the surgeon.

Whilst the education of the apothecary has been thus improving, and his position changing from that of a dispenser of medicines to a medical practitioner, the mode of remunerating him has not changed correspondingly. The old apothecary appears to have been paid for his medicines only, no account being taken of his visits or advice; for it has been only very recently decided by the judges that a licentiate of the Apothecaries' Company can legally claim compensation for his visits

and his time. Many are still paid almost exclusively by their charges for medicine, and nearly all look to this as the chief source of their income. A very few charge cost-price only for their drugs, deriving their gains from charges for their visits. A still smaller number of general practitioners supply no medicines, but write prescriptions, and are paid solely for their visits and time.

It is easy to see that the practitioner who is remunerated chiefly by payments for medicine, is not only subjected to the temptation, but is often really obliged to send more medicine than is needed, in order to be able to live. It is not meant that medicine is sent which will do harm, but patients are often called upon to swallow innocent, though not always agreeable drugs, instead of being required to pay for the really useful article—namely, the medical man's time and skill. A community so trained of course think all this medicine useful and necessary; an irrational faith in its powers is fostered; and they would feel dissatisfied with the man who should adopt the more straightforward and honest practice of sending them no more drugs than are good for them. The evil is not confined to the public: it has been equally felt by the medical man. He has been a petty trader rather than a professional man; his self-respect has been lessened by having to supply under really false pretences, and to charge for an article not wanted; his position in public estimation has been lowered by the gradual discovery of the real state of things; and too often an unfounded degree of confidence in drugs has been fostered in his own mind. He gives physic for the sake of the pay, until he ends by believing in its necessity. A habit of meddling activity is apt to be engendered, by which not a few patients are made worse instead of better. His practice also suffers; for the public, finding themselves dosed with unnecessary drugs, often run into the opposite extreme; and losing all confidence in them, and in regular practitioners, fly to hydropathy, homœopathy, and other forms of error or imposture.

In Scotland a different state of things has prevailed. There they have druggists, surgeons, and physicians, but no apothecaries. The surgeons sometimes supply their own medicines, charging a low price for them, but more frequently they only prescribe. The duties of the 'general practitioner' are performed by surgeons, often by physicians, who in that case charge only a small fee; and very commonly by gentlemen possessing at the same time a surgeon's diploma and a physician's degree. Most of the leading physicians in Scotland are 'family physicians' in a great number of families—that is to say, they are the only medical attendants. At the same time, being the most eminent men of their body, they are applied to as 'consulting practitioners' in cases of greater difficulty or danger. The physician in Scotland retains the place which he has always held, whereas in England he has been almost superseded as a 'family physician' by the advancement of the apothecary, and he is too often regarded as a consulting practitioner only. It will be at once seen that the temptation to give unnecessary quantities of medicine has been much less in Scotland than in England, and that this fact will explain the corresponding difference in the habits of the profession and of the public in the two countries.

The remedy for these evils is simple. Let the public be made to understand that the money which they pay to a medical man ought to be given chiefly for his time and skill, rather than for drugs. Except in remote country districts, it would probably be an advantage if medical men kept no drugs, but only wrote prescriptions. This would remove every temptation to the evils which have been described, and would also render the professional intercourse of the consulting and general practitioner more satisfactory. When two medical men agree upon a plan of treatment, it ought not to be in the power of one of the two to yield to the temptation, which may be presented in various ways, to adopt

a different practice from that which has been settled between them.

Whilst the evils adverted to admit of remedy, there is another class of evils far less remediable, not arising from the abuse of medicines, but still connected with the relationship between medical men and the public. It is very much to be regretted that even the most intelligent portion of the community have not, and perhaps never can be expected to have, the knowledge of physic required to enable them to compare justly the merits of one medical man with another, or of medical men with quacks. It is the right of each person to choose among a number of practitioners, regular and irregular, the one that he will employ, and to choose among rival systems that by which he will be treated. Yet nothing is more certain than that few persons are qualified to choose well. Their selection, even if it happens to be a wise one, is more likely to be determined by bad than by good reasons. There is much truth, as well as some exaggeration, in Dr Johnson's remark, that 'a physician in a great city seems to be the mere plaything of fortune; his degree of reputation is for the most part totally casual; they that employ him know not his excellence; they that reject him know not his deficiency.' This is a very discouraging circumstance in the life of a scientific physician, as compared with that of a member of either of the other learned professions. One or two illustrations, taken from actual observation, will show the kind of difficulties which the public encounter, and by which they are liable to be misled.

The cure of a patient is accounted, and, with due precautions, ought to be accounted, a proof of skill. But the recovery of a patient is not always a proof of skill, nor even of the absence of ignorance on the part of the practitioner; for to keep a patient from immediate death is only one part of a medical man's duty. Take, as an example, rheumatic fever. The patient's suffering is excruciating, yet he seldom dies during the attack. Suppose two similar cases, treated by two different medical men, or one by a regular, and one by an irregular practitioner. Both patients will probably escape death, and both the practitioners will therefore probably be accounted skilful. But on further inquiry, it may be found that one case lasted four or five days only, the other twenty or thirty. Is it nothing to have saved a patient several weeks of agony? Both, however, at last resume their duties. It may then be found that the one can do anything that he was able to do before his illness, and with the same comfort; whilst the other begins to suffer, sooner or later, from symptoms which turn out to have their origin in disease of the heart, left by the rheumatism. Both these cases were reputed to be 'cured,' but surely the cure was a very different thing in the two cases. The one patient continues well; the other is an invalid from the first, and after a few years, dies of dropsy: yet the public know no difference.

The disease to be treated may be an incurable one. Patients or their friends are too ready to think that it does not matter by whom an incurable disease is treated. There is the greatest difference, however, in the amount of suffering to be endured, and in the length of life in such cases, according as the treatment is judicious or otherwise. But the greatest difference between different medical men, and especially between medical men and quacks, in incurable diseases, as well as in others, is in their skill in finding out what the disease is; in other words, in what is technically termed the art of *Diagnosis*. An ignorant medical man, conscious of his inferiority to abler ones in this branch of knowledge, often plumes himself upon being still able to treat disease as well as they can. But it is easy to show that, both in curable and incurable cases, the correct treatment must be based upon correct diagnosis; and therefore that the man who is inferior in the one art, must, in the great mass of cases, be inferior in the other also. A patient seeks advice, and,

without perhaps suspecting it, is in the early stage of consumption. How much may depend upon the positive discovery of the real disease! To say nothing of cure—which, if it is to be hoped for at all, can only be in the earliest period—nor of the prolongation of life by judicious change of climate, the discovery of the disease may affect the question of marriage, of entering into or leaving business, and of life insurance. Again, another patient seeks advice who suspects that he is consumptive. A man unskilled in diagnosis can only give an equivocal answer to the inquiries made, whilst another, better informed, may be able to state absolutely that the disease is not consumption, and that there is no reason to fear that disease, and so may dissipate at once the fearful anxiety of the sufferer and his family.

Another patient suffers from dropsy. One man treats it by rule, and for the time gets rid of it, but does no more. Another discovers the cause of it, and gives the patient such further directions as may prolong his life for years. A patient is the subject of disease of the heart, but does not know it. A man who can detect it is able to apprise him of it, to warn him against injurious or dangerous habits, and so to prolong his life, and enable him to make arrangements in anticipation of a sudden death. Another patient fears that his heart is diseased, and seeks to have the question determined. A practitioner, skilled in diagnosis, may be able with certainty to assure him that the disease is only nervous palpitation, and is wholly free from danger.

In curable diseases the importance of skill in diagnosis is even greater than in incurable ones. A patient is the subject of *scurvy*. One man does not know the disease, and cannot therefore treat it, and the patient dies. Another sees what it is, gives lemon-juice, restores health in a month, and then points out the causes from which it has arisen, and thereby enables the patient to avoid the disease in future. The ignorant medical man and the impudent quack, if asked the question, will no doubt answer that they can cure *scurvy* as well as the ablest man in the land. So they can, when they are told that the case to be treated is *scurvy*; but ere they discover this the patient dies.

A female seeks advice with a pain in the side. One man sees in it a pleurisy, bleeds the patient, and throws her down for months. Another sees it is a nervous pain, strengthens the patient, and cures her in a month.

A patient is seized with symptoms of high fever. One practitioner sees that it is the beginning of typhus, husbands the strength, and saves him. Another believes it to proceed from an internal inflammation, bleeds largely, and so takes away that power which alone could resist the fatal poison of the disease. All these instances are taken from observation; and the same observation has shown that the patient and friends rarely see the difference between the two practitioners, and that they not unfrequently blame and discard the skilful one, and laud and patronise the ignorant or the dishonest one.

A medical man is often very unduly praised or blamed for changes which arise from the natural course of the disease, and with which he may have nothing to do. The same disease runs a very different course in different cases, from causes with which we are but imperfectly acquainted, and quite independently of any difference in treatment. The course of *consumption* will afford a good illustration of this truth. One case will get rapidly and progressively worse, and will end fatally in a few months, whatever treatment is adopted. Another case will begin and go on in the same way as the first up to a certain point: the patient will then improve, and perhaps appear to get well. After a time he relapses again; and these alternations of comparative health and severe suffering may occur many times, and the disease be protracted over a period of many years, ending fatally at last. The medical man commonly gets the credit of being the cause of each change, whether for good or ill, and is praised or blamed accordingly. Such cases are a fertile source of reputation to irre-

gular practitioners, who claim credit for the improvement, and easily find something, or some person, to blame for the aggravation of the disease.

A surgeon is consulted in the early stage of a serious disease. The nature of it is yet doubtful: he may think the case trifling. The illness goes on; the patient becomes worse; consults another surgeon. The nature of the disease has then become plain, and is announced accordingly. The first surgeon is accounted a blunderer, the second skilful; yet the very reverse may be true.

A surgeon makes a clear mistake; the patient finds out that he has done so, blames and discards his adviser for ever. The surgeon may, notwithstanding, be a very able and a very skilful man. There is no man living who does not make mistakes sometimes.

Two medical men are consulted in succession: each gives a different opinion. The patient almost invariably assumes that the *second* is right, and blames the first. If the two men previously occupied an equal professional station, the one opinion should still be regarded as equally good with the other, until further evidence has shown which was right.

Another error consists in supposing that a medical man cannot have acquired much experience until he is considerably advanced in life. The frequent consequence of this is shown by the adage—'A physician cannot earn his bread until he has no teeth to eat it.' The late eminent surgeon Mr Liston has well exposed this error in the following words:—'Years are not the measure of experience. It does not follow that the older the surgeon is, the more experienced and trustworthy he must be. The greatest number of well-assorted facts on a particular subject constitutes experience, whether these facts have been culled in five years or in fifty.' One man advantageously placed may have seen more patients at the age of thirty than another has seen at seventy. But the number of patients seen is not the only guide to the amount of experience. One man, from natural ability, or industry, or the stimulus to think, furnished by the circumstances in which he is placed, sees more and reflects more, and therefore extracts more experience from one case than another does from a hundred.

An excessive confidence in physic, if not the parent, is certainly the nurse of quackery or irregular practice, both without and within the pale of the profession. Whilst there is suffering to be relieved, there will be found ignorant and weak men, who deceive themselves, and dishonest men, who deceive others, in professing to have the power of relieving it. Examples of cure are adduced, circulated; and believed, and so the fame and practice of the empiric are extended. We do not propose to enter into a discussion of the subject of quackery: the question is too large for the end of an article like this, but one or two remarks upon it may not be without their use.

Medical men and the public commonly take different views of this subject. Medical men are charged with professional prejudices, and with interested motives, which shut their eyes to the truth. They, on the other hand, think that the public are not qualified to discern, until schooled by a disastrous experience, the deceptions practised upon them. We believe that it is not the interest of medical men to oppose any improvement of their art, and that, as a body, they do not think it to be so; and as to professional prejudice, we ask for evidence of the existence of anything more than a due measure of scientific caution. History will show how many infallible remedies for various diseases have been vaunted and forgotten: for how many improvements can history show us that we are indebted to quacks?

But cures are adduced, and respectably attested. Facts are stubborn things—how are these to be set aside? Some of them are true, and some of them are false. The history of empiricism is full of interest to the mental philosopher. The phrenologists have an organ of wonder; and of the existence of the *faculty* ascribed to this

organ, we think it is impossible to doubt. Whatever is new or marvellous has an irresistible attraction for some minds; to doubt the marvel is to rob them of their idol. What they love they cling to; and without a particle of conscious dishonesty, they will solemnly attest to be true that which is plainly and indubitably false. History will place beyond the power of any to doubt the assertion, that it is impossible to invent statements more absurd and more false than some which have been attested as facts by intelligent and respectable persons. One instance of this kind may be given from the life of an individual, of the value of whose pretensions most persons will probably by this time have formed the same opinion. St John Long professed to have a liniment which would cure consumption; and he declared it to possess this remarkable property—that when rubbed upon the chest, it would produce a sore upon the skin over the diseased part of the lung, but would produce no effect upon the skin over the sound parts. Many persons of rank, intelligence, and undoubted integrity attested the truth of this statement in a court of justice. Yet the fact so attested was undoubtedly false, and few persons probably now believe it. The public caressed St John Long, enriched him, and when, in spite of his own liniment, he fell a victim himself to consumption, they raised a splendid monument to his memory. The liniment still exists, and consumption finds as many victims as ever. Can it be a matter of surprise that medical men, whose pursuits necessarily familiarise them with a long succession of such frauds or follies, should be slow to believe the reports of improbable or impossible cures, which are propagated by silly, sanguine, or wicked men, even when they are attested by respectable and disinterested persons? But some of the recoveries are real: how is the argument in favour of quackery drawn from these to be disposed of? The explanation will be different in different cases.

It is not by the result of a few single cases that the benefit of any plan of treatment can be judged of. It is only by a comparison of the results of a large number of cases treated in one way, with an equal number similarly circumstanced, treated in another way, that the truth can be arrived at. Such a comparison the public have neither the opportunity nor the requisite knowledge to make. Take a number of cases of any curable disease, and treat them all in the worst possible way, and a few of them will be almost sure to get well. The most ignorant quack will therefore be able to adduce some recoveries, which he will parade as cures. The failures *he* will take care not to talk about; and no other person will think the matter worth his trouble. Thus a number of persons may die who could have been cured; still more may have been kept in protracted suffering; and the public can never know these facts. An occasional recovery, well advertised, either by zealous friends or in the usual newspaper channel, will make a reputation that will often wear long enough to accomplish the author's purpose, by filling his pocket.

All quacks are not to be placed upon the same level, nor are they all without the limits of the medical profession. The essence of quackery is one spirit assuming many shapes. Universally it ministers to the love of the marvellous, by its reports of wonderful cures, generally effected by some *novel* means: it profits by the pain which doubt, or suspense, or absolutely blighted hope inspires; and it soothes and pleases by confident promises to do that which is impossible. It builds up a reputation out of the ruinous materials of the reputation of others which it has pulled down: it creates a danger that it may have the honour of removing it: it conjures up disasters which would have come but for its timely and providential interference: it blows its own trumpet, and persuades or pays others to blow for it: it often makes a profession of pure disinterestedness, whilst it is always purely selfish, although it often for a time ingeniously hides the vice.

We will now briefly indicate a few of the ways by which an explanation may be given of most of the

'cures' attributed to quacks, admitting at the same time that they may at times do good by accident: and also that *many* cures ascribed to the regular doctors might fairly be attributed to the causes here pointed out:—

1. The regulation of the diet—the omission of excessive drinking, or smoking, or the correction of some other bad habit, may have done all the good. Examples: cases of indigestion, nervous depression, &c.
2. The natural powers may have effected a cure in many cases, independently of, or in spite of other means employed at the same time. Examples: common cold, slight fever, mild cases of erysipelas, measles, scarlet fever, &c.; and even some more severe diseases.
3. The improvement may be a part of the natural course of the disease. Example: some cases of consumption, as previously explained.
4. A trifling disease may be mistaken for a serious one—as a cold for consumption—and the latter disease may then appear to have been cured. So an innocent swelling may be mistaken for cancer.
5. We have known patients convalescent from serious diseases, before they had regained their wonted strength, become impatient, consult an irregular practitioner, and then give him credit for the subsequent improvement, which was simply due to the gradual return of health under the influence of natural causes.
6. Faith.—The confident expectation of benefit cures many. This is especially seen in nervous diseases. Many years ago Dr Beddoes and Sir H. Davy were engaged at Bristol in experimenting upon the effects of breathing various gases. Sir H. Davy wished to observe the effects of the respiration of some gas upon a patient suffering from palsy. Before using the gas, he noted the temperature of the patient's body, and for this purpose he inserted the bulb of a small thermometer under the tongue. The man imagined this little preliminary proceeding to be the means of cure, and immediately declared himself cured. Innumerable examples of this kind might be culled from the records of science.
7. Injudicious medical men not unfrequently do harm, as by bleeding, purging, and otherwise depressing patients who really require support. Suppose a homœopathist then called in, and doing what we take leave to assume as nothing, the patient may gain time to recover strength, and appears to be benefited.
8. There are some diseases which we have little or no power to cure, but which ordinarily cease after a time of themselves—such is the suffering produced by the passing of gall-stones. A patient may have been treated for months by a surgeon without benefit; another surgeon or a quack is then consulted. The disease ceases sooner or later spontaneously, and the last-come takes the credit, which is due to neither, but solely to nature.

In conclusion, we must guard against an inference which would not be warranted, but which an inattentive reader might draw from what has been said—namely, that we have no faith in drugs. Although we do not believe much which is currently received, both in the profession and out of it, we have the firmest faith in the benefit to be obtained from the proper use of drugs. We will refer to a few facts, as examples only of the kind of evidence upon which our faith rests. We appeal, then:—1. To the case of ague.—It will go on for months if left to nature; it will ruin the general health, and destroy life. It may be stopped in most instances, at almost any period of its course, by a single dose of quinine, and almost always by a very small number of doses.
- 2. To cases of anæmia or bloodlessness.—A girl blanched, feeble, and useless, becomes rosy, strong, and fit for any work under the use of a short course of iron.
- 3. To the immediate benefit often afforded by opium in asthma, colic, neuralgia (tic), rheumatism, and many other spasmodic and painful diseases.
- 4. To the benefit of opium in delirium tremens—the trembling delirium of drunkards.—A furious maniac is restored to reason by a few doses of this drug.
- 5. To the benefit of opium and other astringents in dysentery and diarrhœa.
- 6. To

the utility of iodine in many cases of swelled neck (bronchocele). 7. To the utility of arsenic in various diseases of the skin; of sulphur in the itch; of various drugs in St Vitus's dance, and in losses of blood from different parts; and lastly, to the utility of alcoholic drinks in certain forms of fever.

These facts might be increased, if necessary, to any reasonable amount. They are simple enough, and common enough to be verified by any one, and they admit of no dispute. We invite those who doubt the utility of drugs to seek an opportunity of witnessing them, and to reflect upon them, with a simple desire to find out the truth, and we will answer for the conclusion to which they will be forced to come.

THE CONTRAST.

It was in a town in one of the northern counties of England that a festive meeting was one evening held. The light from the chandeliers fell on a table loaded with the choicest delicacies, and glanced back again from the plate and rich cut glass with which it sparkled. It was indeed a gay sight that splendid table: the rarest wines circulated freely, and many was the glass of sparkling champagne, or rich glowing Burgundy, quaffed by the joyous company assembled there. It was a dinner where all the officers of a certain honourable corps of yeomanry-cavalry met to eat and drink, and show their loyalty to their Queen and country.

The colonel of the regiment, a peer of the realm, was acting as president on this auspicious occasion; and, to use a newspaper phrase, the utmost conviviality and good-feeling prevailed among the guests. They did ample justice to the well-furnished board, proving the sincerity of their commendation by their actions, when they pronounced both the venison and the champagne excellent, and seemed resolved to enjoy themselves to the utmost of their power. Speeches followed the dinner—toasts were proposed and drank with acclamation—songs were sung—the laugh and the jest circulated as freely as the bottle; and nothing could exceed the hilarity of the whole meeting.

Mirth and music combined to make it charming: all that money could purchase, or refined taste could desire, was there; and who would raise a voice of disapprobation?—who would call in question the propriety of such a meeting?—one which tended so strongly to create a social and friendly feeling, to give rise to acquaintances useful in life, or to promote and strengthen a kind and neighbourly disposition amongst the guests.

But this was not the only convivial meeting on that evening. A few miles from this place, had any one taken a view of the tap-room of the little beer-house called the Crown, they might have witnessed an assembly as mirthful, though less elegant, than the feast of the yeomanry-cavalry. It was a long, low room, well furnished with settles and tables, which bore the marks of many a blow, and much rough usage; the plaster walls were discoloured by smoke, and greasy from the heads, shoulders, and fingers which for years had lolled against them. Two dingy oil lamps, high upon this wall, added their smoke to that of the many pipes at this moment lighted; and certainly to a refined or fastidious taste the place would have had little charms. But there were merry voices there too; laughter and song was to be heard; the joke was not wanting; and many a rough swarthy face, resting on the broad hand, or leaning over the crossed arms, which sprawled upon the table, relaxed into a grin as some favourite topic was touched upon—some standard jest among the village gossip.

A thin, anxious, careworn-looking man entered the room whilst they were merrily laughing in this way; he looked around him with a sigh as he saw the joyous faces assembled there, and thought of his own comfortless and squalid home. They pressed him to join them; he was fretting?—he was working too hard?—he was out of work?—or what was the matter to make poor Johnson look so very wo-begone?

No; he could not stay; his wife was sick, his children

were hungry, and he must return with the wages which had just been paid him for half a week's work—the only employment he had had for ten days.

But they pressed him to stay; they set before him a foaming tankard; one even offered to treat him to a pint if he would remain and sing the song for which he was so famous.

He yielded; flattery, comfort, and cheerful society carried the day over natural affection: he fully intended every draught should be the last, but there seemed always some excuse for swallowing another; and by midnight, when he attempted to return home, he was sufficiently intoxicated to be unable to walk steadily.

In company with one of his companions, who was more sober, but much more noisy than himself, he set out. The other man would shout and sing, and succeed in making such a disturbance, that the rural policeman was seen approaching. Andrews, the noisy one, was sufficiently sober to effect his escape, whilst his quiet but stupid companion Johnson was detained by the policeman, with an assurance that he should be taken before the magistrates next morning, and fined for being drunk and disorderly in the streets at night.

It was two o'clock before the officers of the yeomanry-cavalry broke up their gay assembly. Time had flown rapidly away, and perhaps there were few who felt no surprise when they discovered the lateness of the hour. After a few hours spent in heavy feverish sleep, one of the corps rose early on the following morning to return to his own home, a distance of nine or ten miles. His temples yet throbbed with the excitement of the evening before; the shouts of merriment and applause still rang in his ear; the glittering scene still danced before his eyes. But he felt dull, heavy, and miserable—in a frame of mind to quarrel with everything, and especially himself. In the wild excitement of the preceding night, all had seemed brilliant; now he felt rather inclined to wonder where the charm could have been. He remembered all the early part of the evening distinctly, but towards the latter part his recollections were dim and uncertain; and the splitting headache which oppressed him made him conscious that he had somewhat exceeded the bounds of sobriety on the occasion.

He was a young man, and being usually a sober one, to say the truth he felt a little ashamed of himself upon this account. He returned home slowly through the cool morning air, which refreshed and invigorated him; and many a resolution did he form to avoid in future all such excesses.

Edward Gardner—this was his name—was a magistrate: it was bench day; and though he did not often attend, he resolved this morning, as a sort of penance for last night's excess, to do his duty.

Of course one part of their business was to hear the case of poor Peter Johnson, accused of being found at twelve o'clock at night intoxicated, and making a disturbance in the streets. The culprit stood before the magistrates with a countenance still more dejected than it had been last night, and his whole air and attitude betokened misery and shame.

Mr Gardner's companion on the bench, a middle-aged man, fond of talking, with pompous manners, and rather a narrow mind, interrogated the unfortunate man. 'And so, my good friend, we are to understand that you got very drunk last night—eh, my man?'

'Why, please your honour, I was a little overtaken.'

'Overtaken indeed! But what right had you to be drunk, I should like to know?—a man like you, who ought to know better! Pray where had you been drinking?'

'At the Crown.'

'The Crown! Eh! Well now, aren't you ashamed of yourself, idling away your time like that? Why were you not at your work?'

'Please your honour I have no work.'

'No work?—no wonder! A drunken, disorderly fellow like you, who would employ you? It's your own fault entirely.'

Peter Johnson only hung his head more sheepishly than before at that assertion, which he dared not deny,

since it came from Squire Fletcher, though he felt it to be untrue; for he was perfectly willing to work when he had the opportunity, and was as seldom at the alehouse as most men in the neighbourhood. But Mr Fletcher delighted to bully the poor, at least all those who came before him in his magisterial capacity; not that he was really unkind, but it resulted from a desire to show his wit, wisdom, or judgment to the spectators, without any consideration as to the feelings of his helpless victims.

'Well,' continued he, 'I should like to know how you came to go to the alehouse at all?'

'Please your worship, I went to meet Mr Gardner's bailiff, who was to pay me for three days' work.'

'I am sorry my bailiff selected so injudicious a place to pay it,' observed the young magistrate. 'I must look to this.'

'Injudicious! Why, the Crown's a very decent house,' replied Mr Fletcher. 'The premises are mine, and Turner is as regular in paying his rent as any tenant can be. I consider him a highly-respectable man.'

Mr Gardner was silent again: he appeared to be reflecting. His companion went on—'But why could you not go home quietly when you had the money? Answer me that, my good man. No one stopped you, no one compelled you to get drunk, or to make a noise, I presume?'

'Please your worship it was not I made the noise—it was George Andrews, who was with me.'

'Oh no—I daresay it was not you!—and it was not you that was drunk! and it's not you standing here before us! I am sorry, my good fellow, extremely sorry to appear to doubt your word; but unfortunately it's not in my power entirely to credit your statement.'

'I think,' interposed Edward Gardner, 'you might let him off, Fletcher, he looks so wretchedly poor; and after all, it's not clear that it was he who was making the disturbance.'

'Ah, but then, you see, it's such a shocking habit that of loitering in the alehouse: it leads to so much evil, waste of time, and discontent and political discussions, and, above all, poaching: it's there that they arrange all their villainous plans for the destruction of our game. There is no end to the immorality it gives rise to.'

'If you think so ill of this beer-shop, shall we withdraw the license?'

'What! Turner's? No, no; I didn't mean his; it's a very respectable house: I do not accuse him of anything of the sort. However, we must fine this man one shilling.'

'Please your worship I cannot pay.'

'Eh! What did you say?' ejaculated Mr Fletcher. 'What's become of your wages?'

'It was but four shillings, your honour, and I paid two to Jackson for bread we had eaten last week.'

'And the rest—what's become of that?'

Peter remained silent, and fidgeted from one foot to the other with a desponding air.

'What! gone! all gone—swallowed—gone in your cups—eh man? Now isn't it a disgrace to such a man as you to have reduced yourself to such extremities? But you shall learn a lesson; you shall remember and take care of your money: we will commit you, and give you something else to do than to indulge in drinking. Clerk, make out the warrant.'

Whilst the clerk was busy writing, Mr Fletcher, turning to his companion, said, 'Ah, Gardner, I suppose you had a merry meeting last night?'

Edward Gardner feeling this topic to be peculiarly inappropriate to the place and the matter before them, gave a reluctant assent.

'Was his lordship in good spirits?' pursued Mr Fletcher.

'Very.'

'And the wine good?'

He nodded his assent.

'You look a little heavy,' laughed the other: 'too good perhaps. Does your head ache?'

The young man reddened, but knew not how to stop him, when their attention was suddenly diverted by the hurried entrance of a woman, pale, emaciated, and poorly

clad. She carried one child in her arms, whilst two other sickly-looking creatures clung to her gown, and tried to conceal their frightened faces in the scanty folds of her clothing. Tears stood in her hollow eyes, and her frame trembled as much from weakness as from excitement.

'Oh please your worships,' cried she with frantic eagerness, putting back those who interposed to stop her, 'have pity on us, and do not send my poor husband to jail; he has seldom, very seldom, done so before; and if you will forgive him, he will never do so again; but we are all weak in temptation.'

'My good woman,' said Mr Fletcher, 'I cannot allow this noise. If Peter Johnson is your husband, let me tell you that he is here to answer for having broken the law, the dignity of which we sit here to uphold; and that it is this same law which condemns him, not we alone. Pray remember to whom you are speaking, and compose yourself to a proper and respectful manner.'

'I should be sorry to show disrespect to your worships; but pray have pity on my husband, who is a good man as times go, I assure you.'

'And pray how do you account then for his squandering all his money at the alehouse, and leaving you and your family to starve?'

'It's company, sir; and joviality and good-fellowship, your worship. If you found yourself in a comfortable, warm room, light and cheery like, merry companions enticing you, and pleasant chat, and good liquor too, would you leave it at once for a dreary, darksome house, no comfort, crying children, and hardly a mouthful to give them? Oh, gentlemen, may you never be so tempted, or feel how hard a thing it is to resist!'

'Woman, I desire you will not talk in this way! Do you mean to place us on a level, or imagine that I should succumb to the temptations which overpower your weak-minded husband? Begone! Clerk, is the warrant ready?'

'And what is to become of us?' shrieked the wife. 'Are we to starve, I and my little ones, whilst their father is in jail?'

'Constable, remove that woman,' said Mr Fletcher harshly. 'Her noise interrupts the course of justice.'

Peter Johnson was committed to prison, but his confinement was of short duration; in a very few hours he was informed that the fine was paid, and that he might return to his own home. He did so, and to his astonishment discovered that it was no longer the destitute home which he had left it. Food was there for the present, and work was promised for the future, to be dependent on steadiness and good conduct for its continuance.

This was the work of Edward Gardner: he had a conscience, and it whispered to him pretty loudly that the revellers at the Crown were only humble imitators of the gay and aristocratic party which he had joined, and that the excesses which they were obliged to punish in the poor, were equally wrong, and far more inexcusable, in the rich.

A VISIT TO THE SCOTTISH ANTIQUARIAN MUSEUM.

FIRST ARTICLE.

'How shall we employ ourselves this forenoon?' exclaimed a young lady to her uncle, shortly after breakfast, on the morning of a pleasant day in August. 'What would you recommend to wile away Mrs Russell's time, now that it draws near her last day in Edinburgh?'

'I must first know what you have seen before I can offer my advice on the occasion,' replied Mr Lauder. 'You cannot surely have exhausted the *lions* of our Northern Athens in a single week?'

At this moment Mrs Russell entered the room, and overhearing Mr Lauder's remark, she immediately replied, as she shook hands with the querist, 'What have we seen? My dear sir, I think we have seen every hole and corner of the fair city, and it would puzzle me to say what delighted me most. We have rambled up the Water of Leith, and drank of St Bernard's Well.

We have looked down on it from the lofty span of the Dean Bridge, with its splendid and varied prospect of city and country on either side. We have gone through your west-end squares and circuses, with their substantial architecture of polished stone; and then, after looking down on them, as on a map, from the airy heights of your Calton Hill, nothing would satisfy Mr Gregor but that we should explore the lanes and alleys of smoky old buildings which we saw piled up in confused masses beyond.'

'Well,' said Mr Lauder, 'and what think you of Auld Reekie? Wapping or Lambeth is attractive, I presume, when compared to its dingy repulsiveness?'

'I do confess,' replied Mrs Russell, 'that I was loth to be decoyed into the grim alleys and tall narrow courts, where the light of heaven seems struggling in vain for admission; but there is certainly, after all, something grand about these substantial piles of masonry, with their half-defaced shields, and old legends and inscriptions. Then, too, we had for our guide an intelligent friend, who told us so many romantic tales and old-world stories of knights and dames of high degree; or of hobgoblins, warlocks, secret chambers, and haunted houses, that it really seemed like reading a romance, or rather perhaps like acting one, amid the very scenes where it is laid. Nor was it all romance either. All the associations of Modern Athens seem of right to belong to its venerable precursor. We were shown the residence of David Hume, and the mansion—a humble enough one to be sure—whither Boswell conducted Dr Samuel Johnson when he visited Edinburgh on his way to the Western Isles, and where he treated learned doctors and unlearned duchesses with equal bearishness. Not far from this was the haunt of Burns during his first visit to the same city—a dusky old mansion, deserted by Scottish grandees even in the days of the ploughman poet. But indeed your old scenes are a perfect haunt of poets. We were shown the dwellings of Ramsay, Scott, and Campbell; the lodgings of Gay, Smollett, and Goldsmith; the birthplaces of Falconer and Ferguson; while, ever and anon, there mingled with these some old-world story of Queen Mary and John Knox, of King James or Cromwell, of Montrose or Argyle and the martyrs of the Covenant—that I do confess I shall return to Taunton with an impression of interest and pleasure such as I did not conceive it possible any mere town-rambles could convey.'

'You do, indeed, seem to have heartily enjoyed your visit to the wynds and closes of Auld Reekie,' replied Mr Lauder. 'It is, I confess, a source of pleasure I should hardly have ventured to propose as one of your pastimes. But you would not of course omit its more popular attractions?'

Mrs Russell. You mean the Castle and Palace, I presume? We visited both with great delight; inspected the Regalia, the crown of Bruce, the sword of James IV., the ring of Charles I., and the York jewels—these strangely-interesting relics of the hapless race of the Stuarts. We peeped in too at the newly-discovered chapel of St Margaret; but we did not dare to venture over the threshold.

Mr Lauder. And pray what grim goblin haunts its hallowed precincts that you went no farther?

Mrs R. Very substantial goblins I assure you, Mr Lauder. On remarking to the old soldier who escorted us that we would need a light to explore its old Norman chancel—'A light!' said he hastily. 'Quite against orders, ma'am; the gentleman is standing on a bag of gunpowder!'

Miss Gregor. You would have laughed indeed, uncle, had you seen how papa jumped when he heard this. We thought no more of Malcolm Canmore and St Margaret, or the usurping Donald Bane, and the miracles at Dunfermline. I am sure, for my part, I trembled till I saw the door safely locked on the dangerous stores. Is it not strange to turn the most ancient chapel in Scotland—as they say it is—to so vile a use?

Mr L. It is indeed, and disgraceful too. But we

must remember what is still stranger, and may in some degree account for it, that the venerable chapel associated with our pious Saxon Queen has only been brought to light during the past year, after remaining for centuries unheeded and forgot. But we must not waste the forenoon in reverie or vain regrets. You have seen the Palace of Holyrood, I presume; and drunk to George Heriot's memory out of his own cup, still preserved in the magnificent edifice which he founded and endowed? You have visited the old Parliament House, the libraries, and colleges; and have even, as I understand, extended your excursions to Roslin, Hawthornden, Corstorphine, and Dalkeith. What say you to a visit to the Antiquarian Museum? To-day it is open to the public, and I shall have great pleasure in being your guide.

Miss G. La, uncle, you are surely joking! What should we see in the Antiquarian Museum?

Mr L. Much, my dear niece, that may both interest and instruct you. Besides, Mrs Russell describes her visit to the Old Town with such gusto, that I think she is half an antiquary already.

Mrs R. Nay, nay, my dear sir, you altogether mistake me. I do confess, indeed, that I enjoyed my visit to the Old Town in a way I could not have conceived possible: but as to inspecting a collection of old Roman pots and kettles, rusty pikes, and broken crockery, I must confess its merits would be thrown away upon me. I am not quite sure whether I should laugh or yawn.

Mr L. Laugh you may, possibly enough, and you shall have full permission to do so; but I am quite sure you shall not yawn. So come along: lose no more time; but get on your bonnets and shawls, and let us see if the New Town has not also its antiquities, quite as capable of yielding interest and pleasant recollections as those you discovered, so much to your surprise, in the dingy closes of Auld Reekie.

Such was the conversation which led to the visit we are now to describe, to the Museum of the Society of Antiquaries of Scotland. Mrs Russell was an English lady, who had left the pleasant glades of Somersetshire for a brief sojourn in Scotland, during which a whole host of old prejudices had evaporated at the touch of experience, like the morning mists on the hills before the rising sun. The carriage was speedily at the door: and in a short time the party alighted at the entrance of the Society of Antiquaries' Rooms, in George Street, and ascended to the gallery in which their miscellaneous collection of antiquities is displayed.

Mr Lauder walked with his companions round the room, and at the first listless glance, it seemed to promise little more than Mrs Russell's half-jesting inventory of its contents had described. He was one, however, to whom the study of Archaeology was no new thing. He had learned to regard the relics of elder times as something very different from mere idle rarities designed to beguile a listless half hour, or employ the leisure of 'children of an older growth.' Having allowed them to get over the novelty of the scene, along with which there seemed some risk of their getting over its interest also, he begged them to put themselves under his guidance, and take an orderly survey of its contents, as a collection designed to illustrate the science which deals with the unwritten historical records of our race.

The first case to which Mr Lauder begged their attention contains what he described as relics of the *Stone Period*—a collection of hammers, adzes, spears, arrows, &c. all made of stone or flint, which have been dug up from time to time chiefly in the burial-places of the British aborigines. The large stone-hammers were popularly known during the last century, in Scotland at least, as 'Purgatory Hammers,' being designed, according to the vulgar creed, to enable the deceased warrior to knock so loudly at the gates of heaven, that St Peter might hear him without fail, and hasten to turn the key, and give admission to the Elysian fields. A different and more homely superstition conferred on

the little flint arrow-heads—of which the Museum contains a variety of beautifully-formed specimens—the name of *Elf-bolts* or *Elfin-arrows*. These are regarded, even in our day, in the remoter Highlands, as well as in parts of Denmark, Sweden, and Norway, as arrows shot by the fairies, and peculiarly injurious to the peasants' cattle. Thus Wilson represents his disconsolate farmer mourning

'O'er harried roosts an' ankers toom,
By warlocks riding on a broom;
Or on a black-cat naig belyve,
Or south-fast sailing in a sieve;
While snaw-drifts smoothe the silly sheep,
An' dwinin' kye the elf-shot threep,
Maugre the Elfin cup should keep.'

Among these curious illustrations of the rude arts of the British aborigines, and the simple superstitions of their descendants, are some very beautifully-formed flint spear and arrow-heads, a donation of the present king of Denmark, who visited this country in 1844 when crown-prince, and took a lively interest in the comparisons which such collections enabled him to make between his own rude Scandinavian ancestry and those of like barbarian simplicity in the British Isles.

While the ladies were examining these evidences of the primitive arts of Britain, and pressing Mr Lauder with questions which showed how much he had already excited their interest, he directed their attention to a collection of modern New Zealand clubs, spears, and the like relics of a southern voyage, which every sailor who visits any of the Polynesian islands brings home with him as the spoils of the southern hemisphere; and there, among the tattooed clubs and fantastically-carved oars, hung several Polynesian adzes and chip-axes of flint, exactly corresponding to those they had been examining as the weapons and implements of the aborigines of Britain and Denmark.

'But surely, dear uncle,' exclaimed Miss Gregor, 'you do not mean to say that our ancestors were ever such a set of savages as the Tahitians or New Zealanders?'

'Undoubtedly I do,' replied Mr Lauder. 'In the mechanical arts we have evidence here that they were at one time far inferior to the natives of Polynesia. Here,' said he, pointing to a rude flat-bottomed boat which occupies a stand in the centre of the Museum—'here is an ancient British boat, no doubt of the Stone Period we are now considering. It was dug up within 300 feet of the margin of the river Clyde, opposite the Broomielaw, at Glasgow. Mr Stuart remarks of it, in his notices of Glasgow in former times: "This relic of a very primitive age in the history of our country has been formed from a single piece of timber; the trunk, we may believe, of one of those giant oaks which overshadowed in their day of life the gloomy solitude of the ancient Caledonian forests, and has most probably been hollowed, with the aid of fire, by the rude hands of some barbarian Briton." This rude British boat,' added Mr Lauder, 'if compared with one of the vessels of the New Zealanders, decorated with a richly-carved prow, and furnished with a raised platform or deck, would undoubtedly compel us to give the palm of superior civilisation to the New Zealander over the early Briton. But,' said Mr Lauder, leading his companions to another part of the room, and pointing to a long canoe, also formed of a single trunk of a tree, 'let us compare it with this Malay canoe, brought home by Captain Thompson in 1833: even this, you will perceive, though destitute of ornament, is more regularly shaped, and more skillfully and neatly finished, than the ancient Clyde canoe.'

'It is astonishing indeed,' said Mrs Russell. 'I confess I now look upon that rude boat with an interest I never felt in any vessel before. Centuries—many—very many centuries ago, that and such-like vessels formed the fleets of the Clyde, where now hundreds of large steam-ships are arriving and departing every hour, and vessels laden with the wealth of distant shores daily crowd into the port of the western capital of Scotland.'

How interesting would it be to be able to recover some traces of the progress of these British barbarians; but every record of the interval of many centuries is lost beyond recall!

'By no means,' replied Mr Lauder. 'We learn here, in the first place, that they were altogether ignorant of the use of metals, and constructed their weapons and implements of stone, or of deers' horn, or bone. Here, for example, is a rude lance-head of bone, found in an ancient tumulus, and almost exactly corresponding with another hanging on the walls, constructed by the modern Esquimaux for a fish-spear. One not dissimilar to this was found, at a considerable depth, in the Blair-Drummond Moss, some seven miles above Stirling, lying among the bones of a whale. The speculations which such a discovery suggests are curious indeed, but we have not now time to enter on them. It points to a remote period when the broad estuary, in which a whale could swim, not only extended inland, where now a child might wade across the deepest of its streams, but stood at a height of many feet above its present level; and yet even at that remote era the Briton inhabited the carse-land of Stirling, constructed his rude deers'-horn harpoon, and boldly waged war with the monsters of the deep. Here,' said Mr Lauder, directing the ladies to the contents of another case, 'you see the personal ornaments of the same period: bracelets or armillae of coal, jet, or wood; necklaces of the same simple materials; combs, still ruder in construction; and even cups, basins, and porringers roughly hewn out of stone. Here, too, is the half-burnt clay pottery of the British aborigines. Some of the urns are decorated with considerable taste with ornamental patterns, yet we detect in the very finest of them that their makers were ignorant of one of the most ancient mechanical contrivances—the potter's wheel. In the Prophecies of Jeremiah, the prophet remarks, "Then I went down to the potter's house, and behold he wrought a work on the wheels!" So that we perceive this simple device, which was familiar to the Jews more than six hundred years before the birth of Christ, was altogether unknown to our British ancestry.'

'But we cannot afford to spend all day on this department of antiquities,' said Mr Lauder. 'Let us therefore examine next the relics of the *Bronze Period*, as it is styled. Here is a very rich collection of the weapons and implements of the period when the early Britons had learned the art of working in metals—an immense step in the progress of civilisation. Here we see a beautiful pair of the *leaf-shaped swords*, as they are styled, which were dug up only two years ago on the southern slope of Arthur's Seat, in making the Queen's Drive; while others, dredged out of Duddingstone Loch in considerable numbers, point to this as an early seat of northern civilisation. The most common relic of this period is the axe-like weapon termed a *Celt*, one of which was found along with the swords on Arthur's Seat. These have been assigned by earlier writers as the works of the Phenicians, if not of the Romans; but all idea of their foreign origin has been set at rest of late years by the discovery of moulds, made, some of bronze, and others of stone, indicating that the old Briton furnished himself with weapons very much as the modern sportsman casts his own bullets for his rifle.'

'It is worth your while,' added Mr Lauder, 'to read when you go home the picture which Milton has so happily conceived of these first ingenious workers in metal. You will find it in the fifth book of the "*Paradise Lost*," where the Archangel Michael reveals to Adam the future progress of his race, and the varied displays of inventive skill and ingenuity exhibited by his descendants:—

— "The liquid ore he drained
Into fit moulds prepared; from which he formed,
First, his own tools, then what might else be wrought
Fusil or graven in metal."

'But I exhaust your patience, I fear?' said Mr Lauder. 'Oh no, not in the slightest,' responded both his companions. 'On the contrary, you interest us exceedingly.'

Encouraged by this assurance, Mr Lauder drew their attention to another case, which contained the personal ornaments of the Bronze Period. Some of these were of the most beautiful description. Massive gold and silver armlets; or large and heavy bronze collars for the neck, styled *Torques*; and armillæ, in like manner constructed of bronze, in the form of snakes—a common Scandinavian device. There, too, were variegated glass beads of large size, which frequently occur in the tumuli of the same period; with bronze and bone needles and pins; large and richly-decorated brooches made of bronze; a massive chain of pure silver, weighing nearly a hundred ounces, dug up in making the Caledonian Canal; and a variety of other objects, all proving the rapid progress in the arts of civilisation consequent on the discovery of the art of working in metal.

The ladies were still busy inspecting this interesting department of the collection, when a curious old clock in another corner of the large hall struck the hour of four, and warned them that they must return home.

'The clock must surely be wrong, dear uncle,' said Miss Gregor; 'it seems scarcely half an hour since we left home.'

Mr Lauder smiled, as he assured his niece that the old clock was correct and trustworthy. 'You see the *old pots and pans* are not so unattractive as you imagined. We have not gone over one-half of the collection, and it is time that we were home.'

Mrs Russell was equally unwilling to leave the Museum. She thanked Mr Lauder again and again for the very pleasant day she had spent under his guidance, and expressed an earnest wish that, should she be able to prolong her stay in Edinburgh, he would again become their guide, to inspect the remaining portion of the collection. Mr Lauder expressed himself no less gratified by the sympathy they had manifested in what he termed his favourite study of archæology, and assured them that he would greatly enjoy their company on some future occasion, to investigate the Roman and Mediæval Departments, in which the collection is no less rich than in those of an earlier date. In this understanding they returned home, discussing on the way many curious speculations, suggested by what they had seen and heard. Our readers, we trust, have been no less interested, and will be equally willing to accompany them should they accomplish their proposed second visit to the Museum of the Society of Antiquaries of Scotland.

A GLANCE AT THE SIKHS.

Most people have by this time formed some notion of the rise and progress of our Indian empire; but the notion is not, generally speaking, so fixed and precise as might be desirable. The time, indeed, has gone by when our dear countrymen pleased themselves with the idea that the East India Company had marched a regiment of sepoy, officered by Europeans, against the Mohammedan empire, driven the descendants of Timour from the throne, and clapped upon its own four-and-twenty heads the crown of the Grand Mogul. But this heroic illusion has given place in many minds only to other illusions, and much valuable time, therefore, is lost in arguing about shadows and mockeries. It ought to be distinctly understood—or else as distinctly denied—that the Mogul dominion had been utterly broken up, and that the English, who had their commercial interests to protect, as well as being goaded on by their jealousies of the French, found themselves struggling for life and purse among the contending elements of the crumbled empire; that they fought their way step by step, bravely and successfully, till, drunken with blood, and maddened by the rage for gold, they found themselves in a position where retreat was im-

possible, and the onward movement their only hope of safety; that as their territories increased, the idea at length dawned upon them that they were destined to rebuild the empire; and that although this idea was combated from time to time, chiefly by an ignorant, but generous outcry at home, the period at length came when they could no longer doubt that they were the paramount power in India, and, as such, intrusted with the fate of more than a hundred millions of their fellow-men.

While thus driven onwards by chance or fortune, the English exhibited a remarkable mixture of recklessness and timidity. At times, the Mahrattas themselves never went out 'a-kingdom-taking' with less remorse; while at other times they paused, awe-struck at the apparition of legitimacy, in the person perhaps of some brigand who had within their own memory risen from a petty robber into a king. Thus their vast empire was dotted, and is so to this day, with native states, left in greater or less independence, which serve as hotbeds of disaffection and intrigue, counteract successfully the influence of European civilisation, and keep up a chronic war from the Indus to the Brahmapootra, from the Himalaya to the sea. We have for some time past been engaged (much against our own will, as usual) in fortifying our frontier on the west and north-west, by the reduction of the Valley of the Indus, and the country of the Punjab within that line. The lower Indus, or Scinde, to the delight of its people, has been already rescued from the savage Belooches; and now we shall no doubt be forced by recent events to *invite*, after our fashion, the warlike Sikhs to place themselves under the wing of our motley empire. This will be a most important attainment; for the Indus is, geographically, the outer ditch of our vast fortress, beyond which there are only the thinly-peopled wastes and mountains of Beloochistan and Afghanistan—utterly worthless as acquisitions, and if acquired, utterly impossible to retain.

But the reduction of the Sikhs, which would have been easy at the proper time, is now a very difficult matter; for the Sikhs are not a people, but a Sect, which, being in close *rapproch* both with the Hindoo and Mohammedan mind, has a power of expansion that defies all ordinary calculations. We have now before us a history of this singular body, from which we shall endeavour to collect some particulars; and the rather that it is a task which few general readers will be tempted to undertake for themselves. The history is a work of great ability, and exhibiting indefatigable industry; but it is written only for the erudite on such subjects. The very names, which the author has drawn up in grim and threatening array on every page, are more than a sufficient barrier against the ordinary reader: it is as though a historian of Great Britain were to form in line the septs and families of Scotland, Ireland, and Wales; and this not for the purpose of exhibiting their distinctive characteristics, but merely the frantic spelling of their patronymics.*

The Hindoo mind is not stagnant, as many people suppose. A thousand years before the Christian era, the reform of Buddhism, as pure as the first message of Mohammed, made a struggle against Brahminism and its degrading system of caste, which deluged all India with blood. The Brahmins appear to have been successful within the empire; but the nations on the north and east became converts, and the island of Ceylon was the head-quarters of Buddha. In process of time Buddhism degenerated into a system as wild as Brahminism itself; and then came Mohammedanism, to laven and quicken them both for a new development. Towards the end of the fourteenth century a philosopher promulgated the doctrine that 'where the spirit of the Lord is, there is liberty,' and thus broke the fetters of caste

* A History of the Sikhs, from the Origin of the Nation to the Battles of the Sutlej. By Joseph Davy Cunningham, Lieutenant of Engineers and Captain in the Army of India. London: Murray. 1845.

among his disciples; he was followed by another, who preached the omnipotence of faith and self-denial; and then came one who made war upon the worship of idols. As we approach the sixteenth century, we find the minds of the people, both Hindoo and Mohammedan, in a state of strong fermentation; and in the midst there arose the founder of a sect destined to become a nation.

This man, who was born in the neighbourhood of Lahore in 1469, was called Nānuk, and he set himself to the diligent study of both religions, but 'could find God nowhere. He preached one indivisible and eternal God, the equality of men, the necessity for Divine grace, and for leading a virtuous and loving life. He called his followers Sikhs, or disciples, but assumed no other superiority over them than as a spiritual teacher. He was followed by a succession of eminent men; one of whom, by interdicting quietism or ascetism, very early preserved the community from sinking into a mere sect. Another mustered his followers in a hamlet called Amritsir, which has now become a populous city. He collected the writings of his predecessors, established a tax instead of the voluntary offerings of converts and adherents, and began to accustom the people to a regular government. This lawgiver encouraged the pursuit of secular occupations, and was himself a great merchant; but one of his successors—Hur Govind—took to the trade of arms, and marched his followers to the wars of the Empire. He had a stable of 800 horses, and a constant guard of 300 mounted followers, with 60 match-lock men round his person.

In the last quarter of the seventeenth century, Govind Singh purified and strengthened the Sikh doctrines, and this church was now called the 'Khālsa'—saved, liberated, or chosen. The worship of the one true God, in spirit, and not by means of images, the abandonment of ceremonies of all kinds, and the acknowledgment of the perfect equality of mankind, were the grand essentials. Baptism by water was the form of initiation. The Sikhs were commanded to bathe from time to time in the pool of Amritsir, to call themselves Singhs or soldiers, to leave their locks unshorn, to wear arms constantly, and to pass their lives in war. 'The last apostle of the Sikhs,' says Captain Cunningham, 'did not live to see his own ends accomplished, but he effectually roused the dormant energies of a vanquished people, and filled them with a lofty although fitful longing for social freedom and national ascendancy, the proper adjuncts of that purity of worship which had been preached by Nānuk. Govind saw what was yet vital, and he relumed it with Promethean fire. A living spirit possesses the whole Sikh people, and the impress of Govind has not only elevated and altered the constitution of their minds, but has operated materially and given amplitude to their physical frames. The features and external form of a whole people have been modified, and a Sikh chief is not more distinguishable by his stately person and free and manly bearing, than a minister of his faith is by a lofty thoughtfulness of look, which marks the fervour of his soul, and his persuasion of the near presence of the Divinity.'

This remarkable change has been operated in two centuries upon the Jat peasants of Lahore, who were the first converts made by Nānuk to his doctrines of religious reform and social emancipation. After Govind Singh, the Sikhs must be considered as a nation, not as a church; but our limits forbid us to trace their history. During the breaking up of the Mogul empire they obtained in sovereignty the provinces of Sirhind and Lahore. 'In 1784 the progress of the genuine Sikhs attracted the notice of Hastings, and he seems to have thought that the presence of a British agent at the court of Delhi might help to deter them from molesting the vizier of Oude. But the Sikhs had learned to dread others, as well as to be a cause of fear; and shortly afterwards, they asked the British resident to enter into a defensive alliance against the Mahrattas, and to accept the services of thirty thousand horsemen, who had posted themselves

near Delhi to watch the motions of Sindhia. The English had then a slight knowledge of a new and distant people, and an estimate two generations old may provoke a smile from the protectors of Lahore. "The Sikhs," says Colonel Francklin, "are in their persons tall; . . . their aspect is ferocious, and their eyes piercing; . . . they resemble the Arabs of the Euphrates, but they speak the language of the Affghans; . . . their collected army amounts to 250,000 men, a terrific force, yet, from want of union, not much to be dreaded." The judicious and observing Forster put some confidence in similar statements of their vast array, but he estimated more surely than any other early writer the real character of the Sikhs; and the remark of 1783, that an able chief would probably attain to absolute power on the ruins of the rude commonwealth, and become the terror of his neighbours, has been amply borne out by the career of Runjeet Singh. At the close of the last century this celebrated adventurer rose into eminence, organized, by the aid of European science, a powerful military system, and extended his dominions from Thibet to Moultan. 'Runjeet Singh grasped the more obvious characteristics of the impulse given by Nānuk and Govind; he dexterously turned them to the purposes of his own material ambition, and he appeared to be an absolute monarch in the midst of willing and obedient subjects. But he knew that he merely directed into a particular channel a power which he could neither destroy nor control, and that, to prevent the Sikhs turning upon himself, or destroying one another, he must regularly engage them in conquest and remote warfare.' The Maharajah died in 1839; and in six years after—in 1845—the Sikhs crossed the Sutlej, and engaged deliberately in a struggle with the British empire, which, after a momentary intermission, still continues.

The Sikhs may become able coadjutors of the English in the work of civilisation; but they are the most formidable enemies we have yet crossed swords with in India. According to the highest estimate, they are only about a million and a-half in numbers; but their increase is not according to the ordinary laws of population. Theirs is the standard both of religious and social reform; and it invites under its folds not only the reflecting and philosophical, but the desperate and depraved—the Pariahs of civilisation. The Mahrattas, who had no aid from religious enthusiasm, were merely the low castes of Southern India; and yet in a few years they became a mighty nation, which, with a tithe of the military science of the present Sikhs, would have formed an impassable barrier against the advance of the English beyond Bengal.

'The observers of the ancient creeds,' says our author, 'quietly pursue the even tenor of their way, self-satisfied, and almost indifferent about others; but the Sikhs are converts to a new religion, the seal of the double dispensation of Brahma and Mohammed: *their* enthusiasm is still fresh, and *their* faith is still an active and a living principle. *They* are persuaded that God himself is present with them, that He supports them in all their endeavours, and that sooner or later He will confound *their* enemies for His own glory. This feeling of the Sikh people deserves the attention of the English, both as a civilised nation and as a paramount government. Those who have heard a follower of Goro Govind declaim on the destinies of his race, his eye wild with enthusiasm, and every muscle quivering with excitement, can understand *that* spirit which impelled the naked Arab against the mail-clad troops of Rome and Persia, and which led our own chivalrous and believing forefathers through Europe to battle for the cross on the shores of Asia. The Sikhs do not form a numerous sect; yet their strength is not to be estimated by tens of thousands, but by the unity and energy of religious fervour and warlike temperament. They will dare much, and they will endure much, for the mystic "Khālsa," or commonwealth: they are not discouraged by defeat, and they ardently look forward to

the day when Indians and Arabs, and Persians and Turks, shall all acknowledge the double mission of Nánuk and Govind Singh.'

But even their religious enthusiasm is not necessary for the extension of their sway, for in India it is an easy matter to collect armies without the plea of religion, or anything else but pay; and on this subject our author gives a few details of the history of George Thomas, a European adventurer, who acquired a principality in Northern India. This man was bred to the sea, but deserted from a vessel of war, and took military service at Madras. He wandered to the north of India, and entered the employment of the famous Begum Sumroo; but being disappointed in obtaining her highness's hand, he went into the Mahratta service, in which he defeated a body of Sikhs at Kurnal. The soldier of fortune at length determined to set up for himself. He repaired the crumbling walls of Hansee, once an important fortress, assembled soldiers, cast guns, and proceeded, with various alternations of success and defeat, to conquer territory. He possessed at one time 10 battalions, 60 guns, and a land revenue of L.45,000. He was supposed to be ambitious of subduing the Sikhs; but his enemies were too strong for him, and he returned in 1802 into the British provinces, where he died.

The first husband of this Begum Sumroo, to whom George Thomas made love, from a private in the French service became a military chief of some consequence in India, although, as he was not connected with Sikh history, our author does not mention him. He was a native of Saltzurg, and his real name was Walter Reinhard, although, from the gloomy cast of his countenance, his companions gave him the name of Sombre. How he came to marry the Begum, a lineal descendant of the Prophet, we do not remember; but he first rose into eminence by murdering, at the command of Kasim Alee, Mr Ellis and other British officers taken in the city and factory of Patna in 1763. He then persuaded his master to endeavour to seize upon the principality of Nepal; and they would actually have succeeded, but for the circumstance of one of the men in the secret of the enterprise getting drunk. Sombre now entered successively into two other services; but eventually set up for himself, like Thomas—hiring out his battalions to the highest bidder. At his death, the Begum took the command of the force herself, and made an excellent commandant. Among the officers who entered her service were George Thomas and Le Vassault, both of whom proposed marriage to their mistress; but the Frenchman, unfortunately for himself, gained the prize. After his tragical death, the Begum entered into an alliance with the British government, her forces then consisting of six battalions, a party of artillery, and 200 horse. Her expenditure at this time was L.60,000 a year; but she nevertheless contrived to leave at her death a magnificent fortune, L.600,000 of which came to Mr Dyce Sombre, a grandson of her first husband, whose daughter (by an earlier wife) had married Colonel Dyce.

These instances show what may be the fortune of unaided individuals; and with so many higher influences at work in their favour, it is hard to say where the progress of the Sikhs may stop. In our opinion it ought to be advanced, not hindered, by the British. Sikhism is the intermediate step to Christianity, without which, to all human appearance, Christianity has but little chance in India. 'Our missionaries,' says Captain Cunningham, 'earnest and devoted men, must be content with the cold arguments of science and criticism; they must not rouse the feelings, or appeal to the imagination; they cannot promise aught which their hearers were not sure of before; they cannot go into the desert to fast, nor retire to the mountain tops to pray; they cannot declare the fulfilment of any fondly-cherished hope of the people; nor, in announcing a great principle, can they point to the success of the sword and the visible favour of the Divinity. No austerity of sanctitude convinces the multitude, and

the Pundit and the Moolla can each oppose dialectics to dialectics, morality to morality, and revelation to revelation. Our zealous preachers may create sects among ourselves, half Quietist and half Epicurean; they may persevere in their laudable resolution of bringing up the orphans of heathen parents, and they may gain some converts among intelligent inquirers, as well as among the ignorant and the indigent, but it seems hopeless that they should ever Christianise the Indian and Mohammedan worlds.'

When we say that the progress of Sikhism ought to be aided by the British, it will occur to our readers, from the foregoing sketch, that there is no necessary or original connection between their social and religious reform and the trade of arms. The Sikhs were as zealous when they were a mercantile people, and their lawgiver a great horse-dealer; and when Hur Govind detached them from their peaceful pursuits, and wedded them to a military life, it was only because, in the confusion of the time, when the Mogul empire was crumbling in pieces, they could not otherwise have remained an undivided and flourishing body. The case is now different. There is a paramount power in India; and there is nothing extravagant in the idea that, by a series of judicious measures, the Sikhs might be led back to their original standard—'Peace on earth, and good-will towards men.'

This, however, cannot be accomplished in a day—or a generation; and the hasty politicians of our time will therefore demand that we shall either crush the Sikhs, or leave them and their country alone. They are already counting the cost of our retaining Scinde, and exclaiming that the money would be better spent in improving our original territories and civilising their inhabitants. They forget that, by the insecurity of our position, we have hitherto been forced to postpone almost all such projects; and that without a strong frontier, we should never have either the leisure or the power to do our duty to our interior dominions. The deprecators of the annexation of the Punjab say that in the countries beyond there is as numerous and powerful a population, which in their turn will offer themselves for conquest. But this involves an error. The tribes beyond the Indus have no national union, and the Affghan cities are divided by barren mountains and deserts, and still more by antagonistic interests. The Punjab is the last country on our frontier where there is a regular government and a concentrated population; and of this we must either assume the rule, and lead the Sikhs by degrees into habits of peace, or submit to have the territory of the Five Rivers a thorn in our side for ever.

THE LITTLE SHEPHERD.

ONE evening in the month of July 1525, a child about ten years old, badly dressed, and with bare feet, was driving a flock of sheep across a plain in Picardy. Young as he was, his countenance was grave and pale, and his large dark eyes were intently fixed on a book, which he held open in his hand; while, but for the watchful care of a dog that accompanied him, his fleecy charge might have strayed in every direction without his being conscious of it. He walked slowly on, still looking at his book, until, as he was passing a cottage, a voice from its door recalled him from his abstraction.

'What, Pierre, are you going to pass by your old friend Louison without saying good-evening?'

These words were spoken by an old woman who was spinning at the threshold.

'No, good Louison,' replied the boy with a very serious air; 'I intended to call and embrace you.'

'How say you that, Pierre!' said the old woman. 'One would think you were going away, and that we were never to see you again.'

'I hope, whenever I see you, to find you well and happy,' replied the child.

'And always ready to share my luncheon with my

little Pierre, who on Sunday has the kindness to come and read prayers for me, since I have become too feeble to go to church myself. Here, Pierre, take this nice little white loaf which the baker gave me this morning, and these fresh nuts—and stay, put this in your pocket. What's the child afraid of?—'tis only a silver sixpence. Ah, Pierre, you have fine eyes, and a large high forehead. Do you know I often think you are not destined to keep sheep all your life: something tells me you will be a great man one of these days. Still one thing puzzles me: if you remain here in this village of St Gobain, how are you ever to become great?—a man whom every one will talk of and say, "Do you know that he was once little La Ramée, the son of La Ramée the charcoal-burner and Calinette his wife?"

'Indeed, Louison, I don't think I shall remain long at St Gobain. Who knows?—better days may come; and then,' added he, throwing his little caressing arms round the old woman's neck, 'when you don't see me here, will you pray to God for me? Farewell, dear Louison, I shall never forget you.'

'Why, what do you mean by that, Pierre?—Pierrot!'

But Pierre was already out of hearing; and having overtaken his sheep, drove them towards a farmhouse which stood at some distance, surrounded by piles of charcoal. On his way he stopped at an old oak-tree, and climbing its lower branches, he placed in a deep hollow among them the bread, the nuts, and the silver coin which Louison had given him. As he was getting down, he felt his leg grasped by a powerful hand.

'Ah, little robber of birds'-nests, have I caught you?' said a loud good-natured voice.

'Oh, Richard, is that you?' said Pierre. 'You startled me: I thought at first it was my father.'

'Your father came home long ago; and when your mother went to the fold, she found a very sorry account of her sheep.'

'Oh my mother wont be very angry.'

'Yes, but that's not all,' replied Richard; 'while she was looking for the sheep, she found something else—a book!—and you never saw such a fuss as she made about it.'

'I hope she will give me back my book,' said Pierre, speaking more to himself than to his father's servant.

As he entered the house, after putting up the sheep, his mother met him, and said coldly, 'Go in; your father wants to speak to you.'

A rough-looking man was seated at a table laid for supper, his eyes were fixed on the fire, and his hand rested on the book found in the sheepfold.

'Husband, here is Pierre.'

La Ramée looked up. 'What has happened to keep you so late?'

'Nothing, father.'

'To whom does this book belong?'

'To me, father.'

'Who gave it you?'

'I did, sir,' said Richard; 'I gave him money to buy it.'

'And what do you do with it, child?' asked his father.

'I read it, father.'

'You read it!' cried his father and mother together; 'and where did you learn to read?'

'I taught him,' said Richard. 'The little fellow did me a service one day, and I returned it by doing him another.'

'A fine service truly!' said Calinette.

'If this child is ruined, Richard, we shall have you to thank for it. Teach him to read! Did any one ever hear such folly? Perhaps you have taught him to write too?'

'Alas, I can't do that myself, mistress!' replied Richard.

'That's fortunate, I'm sure; and I should like to know what good will learning ever do him?'

'That's not the question, wife,' said La Ramée; 'certainly, if I could, I should like to have him instructed; but poverty is a sad thing.'

'Oh, indeed it is,' said Pierre with a deep sigh. Then taking courage, he added, 'However, father, if you would'—

'Send you to school, I suppose you mean?' interrupted his father. 'You know I have not the means; I can't afford to feed idle mouths.'

'Here is your supper,' said his mother, giving him a basin of soup and a bit of brown bread.

'May I have my book?' asked Pierre, taking his supper with one hand and extending the other towards his father.

The latter handed it to him, and asked, 'Who wrote this book?'

'Jean de Roly,' replied Pierre.

'Who was that priest?' asked his mother, as she continued to help the soup.

'He was one of the most eloquent orators of the last century, mother,' replied the child. 'He was chancellor and archdeacon of the church of Notre-Dame in Paris. He knew how to read and to write too,' added Pierre with a sigh; 'so that in 1461, when parliament sent a remonstrance to Louis XI., it was he who composed it. Afterwards in 1483, the clergy of Paris sent him to the assembly of the States-General at Tours, where he spoke of the suppression of abuses. Charles VIII., the son of Louis XI., and the father of our present king, Louis XII., was so much pleased with him, that he appointed him his almoner, and kept him at court.'

'There, there—that will do,' cried Calinette.

'You see now I was the means of teaching all that to the little fellow,' said Richard proudly.

'Fine things I'm sure to teach him! Go to bed, Master Wiseacre,' added she, giving her son a slight push—'go and look for your *Jean Joly*!'

'Jean de Roly, mother; and I can't go look for him, because he died twenty-six years ago.'

'But for that, I suppose you'd go to him and all the grand people in Paris; and you, forsooth, the son of a charcoal-burner in Picardy!'

'My father certainly burns charcoal,' said Pierre in a low tone; 'and yet he has gentle blood in his veins.'

'And you think yourself a gentleman, I suppose?' said his mother.

'Oh,' cried the boy, 'I care not for rank or wealth; all I want is to gain knowledge!'

'Well, go to bed and dream that you have it, and it will be all the same thing.'

'Good-night, mother; good-night, father; good-night, Richard,' said Pierre, and went to sleep in the stable among his sheep.

The next morning, when Pierre prepared as usual to take out his flock for the day, he paused on the threshold of his father's cottage, and turning back, said, 'Kiss me, mother.'

'What for, child?' replied Calinette.

'Old Louison says,' replied Pierre, 'that we never know when we may die. If you were never to see me again'—

'What strange ideas the boy has!' said his mother, giving him a hearty kiss. 'There, Pierrot; 'tis time for you to go.'

An hour afterwards, Pierre, having led his flock to their accustomed pasture, commended them to the care of his faithful dog, and turned his steps towards the Paris road. Something in his heart reproached him for leaving his parents, and told him that an enterprise commenced against their wishes could not prosper; but the boy tried to stifle the uneasy feeling, and walked on, carrying a stick and a bundle containing a change of clothes, a few books, and the provision given him by old Louison.

He had not gone far when he saw Richard coming towards him.

'Where are you going?' asked the man.

'I can't tell you, Richard; for if they should ask you at home, I want you to be able to say you do not know.'

'I guess it, child—you're going to leave us;' and the old servant's voice faltered as he spoke.

'Richard,' said the child, bursting into tears, 'dear Richard, don't betray me. You taught me to read; that was like opening the gate of a beautiful garden, and now I want to enter and taste the fruit. I am going to Paris.'

'Without your father's permission?'

'Yes; you know if I had asked him, he would have refused. I shall never forget you, Richard; and when I am learned and happy'—He could say no more; but dashing away the tears that blinded him, was some distance on his way before Richard turned slowly towards home.

That evening there was sad consternation in the farmhouse when the sheep returned under the sole escort of Loulou the dog.

'Pierre! Pierre!—where is Pierre?' resounded on all sides.

Richard alone sat silently in a corner praying God to protect the little traveller.

After much fatigue, Pierre La Ramée at length reached Paris. While passing through the country, he was kindly received, lodged and fed by the peasants, so that he had no occasion to spend the few sous he possessed. But it was different in the great city; there he was obliged to purchase a piece of bread, and having eaten it, to seek a lodging where he best could. The covered entrance to the market afforded a tolerable shelter; and there, with a stone for a pillow, Pierre managed to sleep soundly. Next morning he was awake early by the noise of the town; and seeing a number of children going towards a school, he followed them to the gate. They entered, and he remained standing alone. His heart beat fast, and taking courage, he knocked at the gate.

The porter opened it. 'What do you want?'

'I want to enter and listen to what is going on,' replied the little stranger with simplicity.

'Who are you?'

'A poor child come on foot from his own village to acquire learning.'

'Can you pay for admission?'

'Alas! I have nothing in the world.'

'Then I advise you to go back as quickly as you can,' said the porter, shutting the door in his face.

Still the child was not discouraged; he sat down on the step. 'The children,' he thought, 'will soon be coming out: perhaps one of them will take pity on me.'

He waited patiently until the great gate opened, and the scholars, leaping and shouting for joy, rushed out tumultuously. No one minded poor Pierre; and he might have remained quite unnoticed, had he not started forward to raise a little boy whose foot had tripped against a stone.

'Are you hurt, little master?' asked Pierre.

'No, thank you,' replied the child, and passed on.

Fancy the despair of poor little La Ramée when he found himself once more alone before that large green gate, which seemed resolved never to admit him. Still he waited until the pupils returned; and as the child who had fallen passed by, he saluted him.

'Master,' said Pierre advancing.

'Here,' said the child, offering him a piece of money.

'It is not that,' said Pierre, drawing back his hand.

'What, then?' asked the pupil with surprise.

'Lend me one of your books, little master; I will return it when you come out.'

'What good will that do you?' said the child, greatly astonished.

'Oh, a great deal; it will make me very happy.'

'Here, then,' said the pupil, giving him the first book that came to hand.

It was a Latin grammar. Pierre opened it, and turned over the leaves without being able to comprehend a sentence. When its little owner came out, Pierre returned it to him with a sigh. 'To-morrow I will lend you a French book,' said the child, and he kept his word.

But in this world reading and learning are not all-

sufficient; it is necessary likewise to eat: and in order to do this, however sparingly, Pierre was obliged by degrees to sell part of his clothes, and yet sleep in the open air. Hunger and misery produced their usual effects, and the poor child felt that his frame was sinking.

'This,' thought he, 'is a just punishment from God for having left home without my parents' permission. Oh my poor mother, I have caused you grief enough without adding to it the anguish of hearing one day that your son died far from you without your blessing, or hearing you say that you forgave him. My God, give me strength to go home!'

The prayer was heard. Some time afterwards Pierre once more entered his native fields, feeling that he had done very wrong, and deserved punishment, yet full of trust in his parents' affection.

Richard was the first to see Pierre. He rather guessed it was he than recognised him; for the poor child was so altered, so pale and thin, that he looked like the shadow of the pretty little La Ramée. Richard caught him in his arms, and hugged him with transport.

'Oh how they wept for you!' said he; 'and what difficulty I had in keeping your secret. Well, have you seen Paris? Is it as large as people say? Have you learned a great deal there? Are you very wise now?'

Pierre smiled sadly: 'I have seen but little of Paris,' he said; 'and I return as ignorant as when I set out. Oh, Richard, I have suffered a great deal, especially from hunger. But mother, father—how are they?'

Just then they reached the cottage door: the parents of Pierre tried to look stern and unforgiving, but it would not do. The father's eyes were filled with tears while he told his son that he had forfeited his affection; and the mother covered him with kisses while she protested that she would never embrace him again in her life.

'Come,' said a brother of Calinette, who had lately taken up his abode with the family, 'this is the return of the Prodigal Son. Let every one embrace him and be satisfied. You, brother-in-law, forgive the little fellow; and you, sister, give him some good warm soup. And do you, my boy, promise your parents not to leave home again.'

'Without their permission,' said Pierre.

'What! do you still think of returning?'

'Yes, uncle.'

'Notwithstanding all you have suffered?'

'Oh, to suffer is nothing! to learn is everything!'

Astonished at this determination, the uncle considered for a moment, and then said—'Your desire shall be accomplished, nephew; it would be a pity to disappoint so much courage and perseverance. I am an old man without children, and I have a few gold coins lying idle in my trunk: I think, brother, I'll en spend them in indulging our young scapegrace: what do you say?'

'I say, Vincent, that if you will pay for his schooling, I do not desire better than to have him instructed, and I will readily allow him to return to Paris.'

Great was the joy of Pierre at hearing these words. Behold him again on the high road; but this time with a light heart, an easy conscience, and a pocket furnished with money, and a letter of introduction to the principal of the college of Navarre in Paris.

He arrived, and was admitted. The first time that our young hero found himself seated in a class, with a professor about to instruct him, was an hour of unmixed delight. It seemed to him as though he had neither eyes to see, nor ears to hear, nor memory to retain all he wanted to learn. He came to the banquet of science as a hungry man would come to a delicious feast; therefore the progress that he made, especially in Latin, was so marvellous, that his companions, to commemorate it, Latinised his name, and called him RAMUS. By this name he was ever afterwards distinguished. But the trials the poor boy was destined to undergo were not yet ended.

His uncle, more generous than rich, found at length that his funds were exhausted. He caused a letter to be written to him containing these words:—'Leave the college, dear Pierre; I have no more money to send you. You have now quite sufficient learning to conduct your father's trade.'

Just before the receipt of this letter the principal had told Ramus that in two years more his studies would be completed.

'Two years!' thought he; 'only two years; and I must leave the college! Oh no! I will find some means of remaining.' And instead of despairing, as an ordinary boy might have done, Ramus applied himself to diligent exertion.

For some time the managers of the college had been seeking a servant to brush the clothes and clean the shoes of the pupils. As the wages were small, and the work laborious, but few candidates offered for the place, when one day a young lad presented himself, whose appearance greatly astonished the principal.

'Ramus!' he cried: 'Ramus! One of our best pupils offering himself as a shoe-boy!'

'My uncle can no longer pay for my education, sir, and I cannot bear to leave the college.'

'Well, my child, then remain,' said the master, touched by his anxiety; 'but 'tis a great pity. You would make a better pupil than servant. How much do you expect?'

'Ah, I dare not say.'

'Let us see; on account of your age and anxiety to remain, I will increase the wages somewhat.'

'Sir,' said Ramus with a desperate effort, 'I do not ask money; all I wish is permission to retain my place in the class. I will continue my studies by day, and work hard as a servant by night.'

'And when will you sleep?' asked the principal, greatly affected.

'During the hours of recreation!' replied the noble boy.

What may not be accomplished by a real thirst for knowledge. Ramus steadily continued his almost superhuman labours of mind and body, and in the end he reaped a reward. After leaving the college, he received all the honours and degrees that are conferred on learned men; and King Henry II. named him professor of eloquence and philosophy in the College of France.

He published several works, which still attest the enlargement of his mind and the extent of his knowledge. It was he who invented the letter V. Before his time, U had been employed in all cases when either letter was required.

Ramus became rich and prosperous, as well as learned; but he did not forget his parents, nor his old friend Louison—who had predicted that he would become a great man—nor Richard, who was the first to develop his intellect, in teaching him to read. I am sorry to have to add, that Ramus perished in the year 1572, in the cruel massacre of St Bartholomew.

THE JEWISH PASSOVER AND ITS SANITARY TENDENCIES.

THE origin of the observance of the Passover among the Israelites is well known to readers of the Bible. But very few are acquainted with the trouble and expense entailed on the orthodox Jews who adhere to the canon law as inculcated by the 'Mishna,' particularly the portion entitled 'Helchas Passochim,' wherein is given the formula for the Passover, for the guidance of all true believers.* It is not the intention of the writer to enter into the minutiae, but simply to show the hygienic tendency of the laws of cleanliness, as enforced in the portion of the oral law to which reference has been made.

* The 'Mishna' is a digest of all the laws and usages extant among the Jews, and was published some hundreds of years since to preserve uniformity in the communities of this people, however they might be separated in many lands.

We may premise that the Scriptural or written law, on which the rules, as enforced by the Mishnaic doctors, have been based, are to be found in Exodus, chap. xiii. 7: 'Unleavened bread shall be eaten seven days; and then there shall be no leaven seen with thee, neither shall there be any leaven in all thy quarters.' The portion of this text marked in *italics* forms the data for the minute observances of those laws on which we shall treat; and in order that they may be literally and spiritually obeyed, there is a list in the 'Helchas Passochim' of every imaginable substance that may be subject to fermentation: so that the rabbins in their catalogue include under the term leaven every vegetable and animal substance which modern chemists in their tables speak of as capable of *vinous* and *acetic* fermentation.

As soon, therefore, as the Feast of Purim has passed, it is a custom, from time immemorial, for the females of every Jewish family, rich and poor, to commence the annual cleaning.* Every nook and corner, every drawer, box, and cupboard, every room, from the attic to the kitchen, and every article of furniture in them, is cleaned, for the purpose of removing all accumulations, whether of dust or other extraneous matter, because such accumulations are considered by the Doctors of the Talmud as subject to a species of fermentation, or as generating impurities, which they deem dependent on a similar law. Every room and cupboard is lime-washed; and every shelf is scrubbed, to remove even any stain or extraneous impression, from the probability that such stain has been produced by fermented matter. Thus the rabbins, under the express command of religious observances, have enforced such rigid cleanliness, that the houses of Jews are rendered pure and healthy by the preparations for this annual festival. This may in some measure account for the known longevity of Israelites—the writer of this having known many who attained the ages of 100, 110, and even 120, whilst few die, comparatively speaking, very young. These facts are worthy of attention, as they have been in operation for many hundreds of years before sanitary reforms were thought of, and before scientific men had ascertained that the want of radical cleanliness in the houses of the poor often generated malignant fevers and other disorders.

In most European cities the Jews have been forced to reside in some obscure and huddled locality, where one might expect them to be more liable than the average of the population to fevers and other ailments supposed to arise from filth and want of fresh air. It appears, however, that the Jews are in fact less visited by disease than the generality of their fellow-citizens. This, while attributable in part to their superior temperance, may well be believed to be owing in no small measure to their one month of annual purification and the consequent cleanliness. It may not be altogether uninteresting to add, that the plates, dishes, teacups, and saucers, knives and forks, saucepans, kettles, spoons, &c. which are used during the year, are not used for the Passover; these things being kept from year to year for this one week, or else new articles are purchased. In cases where poverty precludes the possibility of changing everything, there are certain formulæ showing how to purify them with boiling water, or with fire, or both, so as to deprive them of any fermentable matter which might otherwise, as in some kinds of porous earthenware, be absorbed.

The houses of the middle-class Jews, when the annual preparations for the Passover are completed, present a novel and a most cleanly aspect. Every shelf, dresser, table, tray, and cupboard, is covered with beautiful white napkins; and as each Jew has a pre-knowledge of the pains and penalties consequent on not removing

* Some idea may be formed of this annual undertaking, when it is known that Purim commences on the 14th day of Adar (see the Book of Esther); and the Passover commences on the 14th day of Nisan (Exodus, chap. xii. &c.) Hence a whole month is occupied in these important ablutions.

all things subject to fermentation, there is experienced a sensation of purity which reacts on the mind, and disposes the sincere Israelite to express an intense gratitude to God, as if he had been actually a manumitted slave, and felt for the first time the pure air of freedom.* To these facts may be added the constant ablutions prescribed during this month by both the written and oral laws, rendering cleanliness of person a religious obligation; whence also arises cleanliness in culinary preparations. In short, it is manifest that the injunction of the lawgiver, even while one is disposed to smile at the literalness with which it is followed out, has been attended, through that very literalness, with effects of a most salutary as well as extraordinary kind.

THE EDINBURGH REVIEW ON THE WORKING-CLASSES.

THE 'Edinburgh Review' for April 1849, in an article on the clever novel of 'Mary Barton,' combats some of the delusions of the present day respecting the working-classes. It shows from facts the fallacy of supposing that the employers remain unaffected in their prosperity and comforts in bad times, while their workmen are thrown out of employment and starve. It shows the greater fallacy advanced by the stirrers of sedition among the working-men, that capital and labour are antagonistic, and that the share of the labourer is unjustly small. This writer comes clearly and distinctly to the conclusion that factory workers are, as a class, and taking all times together, well off, and in a situation to realise many of the blessings of life. He says—'The wages of men in most such establishments vary from 10s. to 40s., and those of girls and women from 7s. to 15s. a week. And as from the nature of the work, in which even children can be made serviceable, several individuals of the same family are generally employed, the earnings of a family will very frequently reach L.100 a year—and by no means unfrequently, when the father is an overlooker or a spinner, L.150 or L.170—a sum on which families in a much higher rank contrive to live in decency and comfort. Saving, then, out of such earnings is obviously not only practicable, but easy. Unhappily it is rare: for not only is much wasted at the alehouse (though less now than formerly), not only is much squandered in subscriptions to trades' unions and strikes, but among the more highly-paid operatives, spinners especially, gambling both by betting and at cards is carried on to a deplorable extent.† Much also is lost by bad housewifery; and we do not scruple to affirm that, were it possible (and who shall say that it is not?) to transport among these people those thrifty habits, that household management, that shrewd, sober, steady conduct characteristic of the Scotch peasantry, and which are so well depicted in Somerville's "Autobiography of a Working-Man," not merely comfort, but wealth and independence would speedily become the rule instead of the exception among our Manchester artisans. Even as it is, we are cognisant of many cases where hundreds—in some instances thousands—of pounds have been laid by for future calls by factory workmen.'

The writer alleges that the men who habitually labour to persuade the operatives to lay the burthen of their own sins and follies at the door of their employers are never the really distressed, 'but very generally those who have thrown up lucrative employment, because they preferred travelling and haranguing to steady and honest toil. . . . The plain truth,' says the reviewer, and most cordially do we concur in the whole strain of his remarks, 'cannot be too boldly spoken, nor too frequently repeated: the working-classes, and they only, can raise their own condition; to themselves alone must they look for their elevation in the social scale; their own intellect and their own virtues must work out their salvation; their fate and their future

are in their own hands—and in theirs alone. Of the power of the agricultural population to do all this we should speak more doubtingly, if we spoke at all; but in reference to the manufacturing and mechanical operatives, we speak with the conviction of positive knowledge (and the facts we have just mentioned cannot fail, we think, to obtain some credit for us with most of our readers) when we pronounce that for them to be as well off in their station as their employers are in theirs—as well provided against the evil day of depression and reverse—as comfortable, according to their standard of comfort, in their daily life—as respectable in their domestic circumstances—little more is necessary than that they should emulate their employers instead of envying them; that they should imitate their prudence and worldly wisdom, their unresting diligence, their unflagging energy, their resolute and steady economy. It is not higher wages nor more unvarying employment that our artisans need. As it is, they are more highly paid than many clerks, many schoolmasters, many curates. But with their present habits, twice their present earnings would not mend their position. The want is moral, not material. . . . The desperate delusion that the evils of society are to be remedied from *without*, not from *within*, that the people are to be passive parties—and not the principal, almost the sole agents—in their own rehabilitation, has met with far too general countenance in quarters where sounder wisdom might have been looked for. . . . The sounder, sterner, healthier doctrine which we have ventured to enunciate—hard as it may seem to preach it in a period of distress—is the only one which can prevent this distress from perpetual and aggravated recurrence. The language which every true friend to the working-man will hold to him is this:—"Trust to no external source for your prosperity in life; work out your own welfare; work it out with the tools you have. The Charter may be a desirable object, the franchise may be worth obtaining; but your happiness, your position in life, will depend neither on the franchise nor the Charter, neither on what parliament does nor on what your employer neglects to do, but simply and solely upon the use you make of the fifteen or thirty shillings which you earn each week, and upon the circumstance whether you marry at twenty or at twenty-eight, and whether you marry a sluggard and a slattern or a prudent and industrious woman." We are as certain as we can be of anything, that if the factory operatives and mechanics were possessed of the education, the frugality, the prudence, and the practical sense which generally distinguish their employers, no change whatever, either in the regularity or the remuneration of their work, would be needed to place them as a body in a state of independence, dignity, and comfort.'

OUR NATIVE FLOWERS.

Perhaps no one of our readers would dissent from the proposition that beauty, not rarity, is the first quality to be desired in the tenants of our parterres; and for themselves, we have no hesitation in saying that that gardener should not have the direction of our flower-borders who rejected the beautiful because it was common, to make room for the more insignificant merely because it was scarce. No, we prefer before all other considerations beauty of colour, beauty of form, and excellence of fragrance. Moreover, we are not of those who admire most that which costs most; but, on the contrary, we should be best delighted to save every guinea we could from being expended upon the tenants of our out-door departments, in order that we might have that guinea to spare upon our stove and greenhouse; the denizens in which must, beyond escape, be excellent in proportion to their costliness. We make these observations because we happen to know that effects the most beautiful may be obtained by the aid of our native plants: we have seen rustic seats looking gay, yet refreshing, from their profuse clothing of our *vinca minor* and *major*; and we will venture to wager a Persian melon against a pompon, that half the amateur gardeners of England would not recognise these flowers in their cultivated dwelling-place. Again, if any one wishes to have the soil beneath his shrubberies gladsome in early spring, let him introduce that pretty page-like flower the wood-anemone, to wave and flourish over the primroses and violets. Let him have there also, and in his borders too, the blue and the white forget-me-not, *Myosotis palustris*, and *M. alba*. We will venture the same wager that not a tithe of our readers ever saw that last-named gay little

* The pains and penalties for retaining any fermented matter (leaven) on the Passover, involve not only moral and social excision, but also political excision.

† We have now lying before us some particulars showing the prevalence of this vice in one single factory. One man had lost L.7, another L.3, another L.2, 10s. in a single night at cards. In the same mill the losses incurred on one occasion, in the betting on a foot-race, by the hands in one department only, exceeded L.12.

native. Mr Paxton's observation applies to them both when he says—as a border-flower, it has very high characteristics; it only requires planting in a moist soil, slightly sheltered and shaded, to become a truly brilliant object; it is equally good for forcing, very valuable for bouquets, and alike fit for windows, greenhouses, borders, and beds. Under favourable cultivation, its blossoms increase in size nearly one-half. The plants only require to be divided annually, and to have the flower-spikes cut off as the lower florets decay. By thus preventing their seeding, a very protracted display of bloom is obtained. These are not a hundredth part of the native flowers which might be introduced with happiest effect into your gardens. We have seen the broom, the honeysuckle, and the holly-blended with rarer shrubs, and aiding the best conceptions of the landscape gardener; and we have seen garlands of flowers in which not one exotic was interwoven, so beautiful, that none culled from our choicest stove plants could have much excelled them.—*Gardeners' Almanac*.

THE PER CENTAGE OF POETRY THAT WILL PROBABLY ENDURE.

When we look back upon the havoc which two hundred years have made in the ranks of our immortals—and the accumulation of more good works than there is time to peruse—we cannot help being dismayed at the prospect which lies before the writers of the present day. There never was an age so prolific of popular poetry as that in which we now live. The last ten years have produced, we think, an annual supply of about ten thousand lines of good staple poetry—poetry from the very first hands, and as likely to be permanent as present success can make it. Now if this goes on for a hundred years longer, what a task will await the poetical readers of 1919! Our living poets will then be nearly as old as Pope and Swift are at present—and if Scott, and Byron, and Campbell have already cast Pope and Swift a good deal into the shade, in what form and dimensions are they themselves likely to be presented to the eyes of our great grandchildren? The thought, we own, is a little appalling; and we confess we see nothing better to imagine than that they may find a comfortable place in some new collection of specimens—the centenary of the present publication. There shall posterity still hang with rapture on the half of Campbell—and the fourth part of Byron—and the sixth of Scott—and the scattered tithe of Crabbe—and the three *per cent.* of Southey—while some good-natured critic shall sit in our mouldering chair, and more than half prefer them to those by whom they have been superseded! It is a hyperbole of good-nature, however, we fear to ascribe to them even those dimensions at the end of a century. After a lapse of two hundred and fifty years, we are afraid to think of the space they may have shrunk into. We have no Shakspeare, alas! to shed a never-setting light on his contemporaries; and if we continue to write and rhyme at the present rate for two hundred years longer, there must be some new art of *shorthand reading* invented—or all reading will be given up in despair.—*Lord Jeffrey*.

MEDICAL INTERPRETATION OF DREAMS.

Dreaming, as the precursor and accompaniment of diseases, deserves continued investigation; not because it is to be considered as a spiritual divination, but because the unconscious language often very clearly shows, to those who can comprehend its meaning, the state of the patient. According to Albert, lively dreams are in general a sign of the excitement of nervous actions: soft dreams are a sign of slight irritation of the brain—after a nervous fever, announcing the approach of a favourable crisis: frightful dreams are a sign of determination of blood to the head: dreams about fire are, in women, signs of an impending hemorrhage: dreams about blood and red objects are signs of inflammatory conditions: dreams about rain and water are often signs of diseased mucous membranes and dropsy: dreams of distorted forms are frequently a sign of abdominal obstruction and disorder of the liver: dreams in which the patient sees any part of the body especially suffering, indicate disease of that part: dreams about death often precede apoplexy, which is connected with determination of blood to the head. The nightmare (*incubus ephialtes*), with great sensitiveness, is a sign of determination of blood to the chest. We may add, that dreams of dogs, after the bite of a mad dog, often precede the appearance of hydrophobia, but may be only the consequence of excited imagination.—*Dr Winslow's Journal of Psychological Medicine*.

THOUGHT AND EXPRESSION.

BY THE LATE MRS JAMES GRAY.

They flit, they come, they go,
The visions of the day;
They change, they fade, they glow,
They rise, they die away.
And all within the scope
Of one poor human breast,
Where joy, and fear, and hope,
Like clouds on heaven's blue cope,
Can never be at rest.
They press, they throng, they fill
The heart where they have birth;
Oh pour them forth to thrill
Thy brethren of the earth!
In circles still they swim,
But outward will not go;
The lute-strings cage the hymn,
The cup is full, full to the brim,
Yet will not overflow.

When will the lute be stricken
So that its song shall sound?
When shall the spring so quicken
That its streams shall pour around?
Wo for the struggling soul
That utterance cannot find,
Yet longs without control
Through all free space to roll,
Like thunders on the wind!

The painter's pencil came
The struggling soul to aid,
His visions to proclaim
In coloured light and shade;
But though so fair to me
His handiwork may seem,
His soul desponds to see
How pale its colours be
Before his cherished dream.

So from the sculptor's hand
To life the marble's wrought;
But he can understand
How lovelier far his thought.
The minstrel's power ye own,
His lyre with bays ye bind;
But he can feel alone
How feeble is its tone
To the music of his mind.

So strife on earth must be
Between man's power and will;
For the soul unchecked and free
We want a symbol still.
Joy when the fleshy veil
From the spirit shall be cast,
Then an ungarbled tale
That cannot stop or fail
Shall genius tell at last!

IMPORTANCE OF COOKERY.

It is a curious fact, that during the war in Spain, some forty years since, when the French and English armies were alike suffering from the scantiness of provisions, the French soldiers kept up their strength much better than the English, solely because they put such food as they could get to much better account. The English soldier would take the lump of meat, and broil it on the coals till a good part of it was burned almost to a cinder, though even then part of the remainder was probably raw. The French soldiers, on the contrary, would club two or three together, and stew their bits of meat with bread, and such herbs and vegetables as they could collect, into a savoury and wholesome dish. So great was the difference between these two ways, in their effect on the strength and health of the soldiers, that it was remarked that a French army would live in a country in which an English army would starve.—*Family Economist*.

UTOPIAS.

'Before you, had you morning's speed,
The dreamy land would still recede.'

LIKE Sir Guy the Seeker wandering round the enchanted castle of his ladye-love, and even when his locks had grown gray, and his knightly arm had lost its vigour, still ardently hoping and longing for one more glimpse of the fair vision that had once long ago for a moment blessed his sight—even such is the belief in utopias—a belief more of the heart than of the brain, and against which all the weapons of logic often fall broken and ineffectual. Every one has a utopia in his heart, though it may not have 'a local habitation and a name.' Every one pictures to himself scenes of ideal happiness, various as the spirits of their framers, but all lovely—day-dreams which the heart delights to contemplate, but which youth alone is ardent enough to hope to realise. This tendency has existed in every age; and hence the belief or superstition which is the subject of our remarks. But before proceeding further, the title of our article perhaps may require a few explanatory words.

In giving to an imaginary spot, in one of his Scottish novels, the title of Kennaquhair, Sir Walter Scott has very happily translated into Scotch the originally Greek term 'Utopia.' It is a place which has no latitude or longitude in physical geography; and which, accordingly, is a most suitable region wherein to place all that is too wonderful or too beautiful for ordinary earth. The term, therefore, has been applied to those representations of a so-called perfect state of human society which Plato and many after him have delighted to draw; but it is not with such limbos of vanity that we have now to do. All the utopias of philosophers are 'stale, flat, and unprofitable' when placed by the side of the living and lovely ideal worlds which have arisen like emanations from the heart of nations, and have become engrafted on their popular creeds. A brief sketch of these is what we now propose to furnish: and when thousands are rushing to a new El-Dorado on the banks of the Rio Sacramento, it may not prove uninteresting to review, among kindred subjects, the struggles of our forefathers after an equally alluring, though imaginary, land of promise.

The Greeks, who had all sorts of marvels, had a utopia also, in which the fancy of their poets could luxuriate untrammelled by the ordinary laws of nature; and this ideal realm they called the Garden of the Hesperides, and placed far away, nigh to the setting sun. As to its exact geographical position considerable diversity of opinion prevailed; and Hercules, their great hero for accomplishing impossibilities, had to inquire first of the nymphs of the Po, and subsequently of the all-knowing sea-god Nereus, as to its whereabouts,

ere he started on his search. One old writer placed it 'beyond the ocean;' but if plurality of votes is to decide the question, its site was near the foot of Mount Atlas. Here, in the country where, says Diodorus, all the gods of antiquity received their birth, sheltered by lofty mountains from the scorching blasts of the south wind, and with streamlets from the heights meandering through it, and flowing on all sides round it in a serpentine course, bloomed a fair garden, where grew all manner of delicious fruits; and Ovid, pleasing the eye and the fancy more than the palate, makes trees, foliage, fruit, all of gold. The beings who presided over this fair scene were the Hesperides, sister nymphs, varying in number, according to different authors, from three to seven; while a dreadful dragon, which never slept, guarded the precincts from the intrusion of adventurous mortals. This monster is said to have had a hundred heads, and possibly had lives in proportion; but at last his extraordinary existence was cut short by Hercules, who carried some of the golden apples back with him into Greece: but Minerva, the goddess of wisdom, restored them to their native gardens, because she foresaw they could be preserved nowhere else on earth. (This conclusion of the legend is finely allegorical of the distance existing between the world of imagination and the common life of man.) As there are some who consider the wide-spread belief in 'Isles of the Blessed' as the effect of vague traditional reminiscences of the lost Eden of our first parents, we may mention for their behoof that in Paris there is an antique medal (at least there *was* one last century: for aught we know, it may ere this have been melted down in the revolutionary mint) representing Hercules and the dragon at the foot of the gold-fruited tree; and this medal, in the opinion of the Abbé Massieu, but for the male sex of Hercules, would pass for a memorial of the temptation of Eve by the serpent.

The natives of Hindoostan have a story of a great city named Baly having been submerged in the sea, whose gilded pinnacles were seen by their forefathers glittering above the waters, and whose streets are still visible in the clear depths of ocean. But as no one depones to having personally inspected this submarine abode (albeit the best of divers are on these coasts), we pass on to another which has been more fortunate in this respect, and whose story bears some resemblance to that of Jonah and Nineveh; with this difference, that in the present case the prophet would have had no occasion 'to be angry' at the ultimate fate of the city. Amid the burning wastes of sand which lie between Abyssinia and Aden there once existed, say Mohammedan writers, a great city and lovely gardens called the Paradise of Irem. But the king and people of the place (the tribe of Ad) were very wicked; so that the Prophet Houd was sent to threaten them with judg-

ments unless they repented. But they did not; and accordingly all, except the prophet, were destroyed; or, according to another version, turned into apes! The city, we are told, is still standing in the deserts of Aden; but it is only visible to such as are privileged by God to behold it. This favour, it seems, has been enjoyed by one favoured mortal, Colabah by name, who, being summoned by the Caliph Mo'awiyah, related how that, when he was seeking a camel he had lost, he found himself on a sudden at the gates of the city, and 'entering it, saw not one inhabitant; at which, being terrified, he stayed no longer than to take with him some fine stones, which he showed to the caliph.'

Leaving the turbaned Mohammedans of the East, we shall find the imaginative spirit and vague aspirations of the northern races creating a utopia even more poetical, we think, than those hitherto noticed, and certainly exercising a more powerful influence over those who believed in its existence. Passing over, as apocryphal, Macpherson's legend of the Flath-innis, or Noble Island, authentic records show us the belief existing among the Welsh mountaineers, then just emerging from paganism. Looking from their native mountains, they beheld the sun setting, amid golden glories, over the waters of the western sea; and it was far away upon those sunset waves that they placed their utopian realm. They called it *Gwerdonnan Llan*—the Green Isles of Ocean, or the Green Spots of the Floods; and they deemed it a fairyland of bliss, where dwelt the souls of good Druids, who, being pagans, were not permitted to enter the Christian heaven. Yet, though thus the abode of spirits, it was nevertheless a material paradise: they considered that its happy shores were accessible to mortals, and that he who succeeded in reaching it, imagined on his return that he had been absent only a few hours, when in truth whole centuries had passed away. At times it was visible from land. 'If you take a turf,' says an old author, 'from St David's churchyard, and stand upon it on the sea-shore, you behold these islands. One man,' he adds, 'once got sight of them by this means, and forthwith put to sea in pursuit; but they disappeared, and his search was vain. Nowise daunted, he returned, looked at them again from the enchanted turf, again set sail, and again was unsuccessful. The third time he took the turf on board with him, and stood upon it till he reached them.'

Whether this fable originated in an optical delusion similar to the *Fata Morgana*—in the prevalent tradition of the lost Atlantis, or large island in former times existing in the Western Ocean—or in vague rumours of the American continent, cannot be determined; but it is undoubted that the fable was received as sober truth by the Welsh.* It is on record that several expeditions were undertaken for the discovery of the happy islands; and the 'three losses by disappearance of the island of Britain,' lamented by Welsh bards, appear to have all been connected with it. The first of these was the expedition of Madoc, a Welsh prince, who sailed for the 'far west,' and who is believed to have reached Mexico; the second was that of Prince Gafran, who avowedly went in search of the *Gwerdonnan Llan*; the third was that of the far-famed Merlin and his bards, who likewise voyaged for the west. Considerable dubiety, it must be acknowledged, attaches to the accounts of the last of these 'disappearances,' as Merlin is said to have sailed in a ship of crystal.

A veil hangs over the fate of these adventurers: whether they triumphed, or whether they sank in mid-ocean, we know not. One thing alone is certain, that even in the savannas of the new world they were as

far from success as ever. Islands of the blest, indeed, were not unheard of among the simple tribes; but they were known chiefly for the deceptive nature of their fascination. A belief of this kind still lingers among some of the American tribes; and in recent times Bertram mentions in his 'Travels through North and South Carolina' that he found it entertained by the Creek Indians. The river St Mary, he tells us, has its source in a vast marsh nearly three hundred miles in circuit, which in the wet season appears as a lake, containing some large islands or knolls of rich land. One of these the Creeks represent as 'a most blissful spot of earth;' and they say it is inhabited by a peculiar race of Indians, whose women are incomparably beautiful. This terrestrial paradise, they add, 'has been seen by some of their enterprising hunters when in pursuit of game; but in their endeavours to approach it, they were involved in perpetual labyrinths; and, like enchanted land, still as they imagined they had just gained it, it seemed to fly before them, alternately appearing and disappearing.' At length they resolved to abandon the delusive pursuit, and after many difficulties, they succeeded in retracing their steps. 'When they reported their adventures to their countrymen, the young warriors were inflamed with an irresistible desire to invade and make a conquest of so charming a country; but all their attempts have hitherto proved abortive, never having been able again to find that enchanting spot.'

Here, then, is the human spirit first creating an ideal paradise, and then pining for the work of its own fancy. Thus it is also with the most gifted sons of genius, upon whose spiritual eye or ear fall sounds and forms of more than earthly beauty, and who, even while enjoying the delights of human life, long for the realisation of day-dreams, nobler and more lovely far. Listen to the lay which the sweetest of lyric poets puts into the mouth of the wild Indian of the prairies; and say, as he sings of the fascination of his Isle of Founts and its sparkling waters, if the picturesque strain be not emblematic of the enthusiast-votary of high art, wrapt up in the ideal beauty which his soul beholds:—

'But wo for him who sees them burst
With their bright spray-showers to the lake!
Earth has no spring to quench the thirst
That semblance in his soul shall wake—
From the Blue Mountains to the main,
Our thousand floods shall roll in vain.

E'en thus our hunters came of yore
Back from their long and weary quest;
Had they not seen the untrodden shore?
And could they 'midst our wilds find rest?
The lightning of their glance was fled;
They dwelt amongst us as the dead!

They lay beside our glittering rills,
With visions in their darkened eye:—

—the visions of the dreamy land that once had glowed before them like a new Eden, and the memory of which so filled their hearts that there was no room left for any other joy. Thus, in ordinary life, do the imagination and exquisite susceptibilities which provide genius with her divinest joys become to her at times the source of anguish. Pleasure and pain enter by the same portal, and in this way is the lot of her possessors reduced to little above that of mankind at large.

Having thus traversed the four quarters of the globe, and obtained glimpses of utopias of various kinds, and as variously tenanted—some by hoary Druids, others by beautiful women; some by apes, and some by nobody—we now start for the isles of the Pacific Ocean, to view the happy land of the Tonga people. Bolotoo—such is the name of this singular place—is a large island, they say somewhere to the north-west of the Tonga group; but a long way distant. They deem it the abode of their gods; and certainly, by their account, animal and vegetable life proceeds there on very strange principles. Its fruits, flowers, birds, and *hogs*—in the last of which it abounds—are all of rare beauty (except the pigs, we should think); and they are immortal, unless when

* We would suggest that in this, as in many other cases, natural appearances gave rise to the fiction. It is remarkable, in the case of the Hesperian gardens, as in this case, that the supposed place was held as situated under the radiance of the setting sun. The idea of a glorious land amidst this many-hued effulgence seems natural. Perhaps, for similar reasons, the Greeks of Asia Minor adopted the idea of a residence of the gods on Olympus, which they might see to the westward while voyaging on the Egean.—Ed.

plucked or eaten by the Hotoos, or gods; in which case a new pig, bird, or flower forthwith occupies the place of that destroyed. Like all places of the kind, it is very difficult to be found; but once on a time a Tonga canoe was driven thither by stress of weather. The crew were short of victuals, and not knowing where they were, they landed, and proceeded to gather some bread-fruit; but to their utter amazement they could no more grasp it than if it had been a shadow! They walked through the trunks of trees, and passed through the substance of the houses, without feeling any resistance; and at length the Hotoos themselves appeared, and completed the amazement of the Tongese by walking through *their* bodies as if they had been of air. 'Go away immediately,' said the Hotoos; 'we have no proper food for you; and we'll give you a fair wind, and a speedy voyage home.' Profiting by the good-natured offer, they put to sea directly; and after sailing for some days with the utmost velocity, they at last got safe to Tonga. But in a short space of time they all died—not as a punishment for having been at Bolotoo, but as a natural consequence—the air of Bolotoo, as it were, infecting mortal bodies with speedy death.

We cannot conclude this notice of the imaginary realms which fancy has located in various parts of the world, without adverting to the celebrated fable of El-Dorado, which for ages dazzled and deluded the most gallant adventurers of Europe. Misled by the imperfect science of his day, the illustrious discoverer of the New World imagined that one part of Southern America was nearer the sun than the rest of the world; and influenced by the fervour of his imagination, and the novelty of the scenes around him, he deemed that there the original paradise of our race was to be found. This idea of Columbus seemed to be confirmed by the reports of the natives; and soon it became generally credited that a golden region existed in the interior of the country lying between the Orinoco and the Amazons. Its rocks were represented as impregnated with gold, the veins of which lay so near the surface, as to make it shine with a dazzling resplendency; and its capital—Manoa—was said to consist of houses covered with plates of gold, and to be built upon a vast lake called Parima, the sands of which were auriferous. Among the many stories told of this wealthy region, one Martinez, a Spaniard, deposed that, having been made prisoner by the Guianians, he was by them carried to their golden capital, where he remained several years, and was then conveyed blindfold to the borders, that he might not be able to make known the approaches to that envied principality. Von Hutten and his companions in arms solemnly averred that they saw—but, by a body of ferocious Indians, with whom they had a long and bloody combat, were prevented from reaching—a place containing structures whose roofs shone with all the brilliancy of gold.

The tales of this golden land were not altogether fabulous, and the recent investigations of Humboldt afford an explanation of many of these recitals. When near the sources of the Orinoco, he informs us, he found the belief in El-Dorado still existing among the natives, and he points out the district between the sources of the Rio Essequibo and the Rio Branco as furnishing the groundwork of the fiction. 'Here, in a river called Parima, and in a small lake connected with it called Amucu, which is occasionally much augmented by inundations, we have basis enough on which to found the belief of the great lake bearing the name of the former; and in the islets and rocks of mica-slate and talc which rise up within and around the latter, reflecting from their shining surfaces the rays of an ardent sun, we have materials out of which to form that gorgeous capital whose temples and houses were overlaid with plates of beaten gold. . . . We may judge of the brilliancy of these deceptive appearances, from learning that the natives ascribed the lustre of the Magellanic clouds, or nebulae of the southern hemisphere, to the bright reflections produced by them.'

Moreover, we find an old resident in Guiana representing part of the country as abounding in 'mines of white stone, in which are much natural and fine gold, which runneth between the stones like veins.' Another says—'The high country is full of white sparre; and if the white sparres of this kind be in a main rock, they are certainly mines of gold or silver, or both. I made trial of a piece of sparre, and I found that it held both gold and silver, which gave me satisfaction that there be rich mines in the country.' So late as the middle of last century, a Spanish company attempted to extract gold from these alluring rocks; but after great loss had been incurred, the undertaking was abandoned.

Though enterprise succeeded enterprise to discover this fabulous kingdom, each new adventurer experienced little difficulty in finding comrades to embark with him. The excitement in Europe was extraordinary. In Spain, we are told, 'the desire to be included in the adventure excited an eager competition, and led multitudes to dispose of their property—even landed estates—never doubting to be repaid tenfold from the treasures of El-Dorado.' For long the belief lingered in the hearts of men. In the early part of last century the Jesuit Gumilla unhesitatingly embraced the old opinion; and about 1770, Don Manuel Centurion, then governor of Spanish Guiana, was so ardent in his faith, that one more expedition set out on this luckless enterprise. Of this party only one man returned to narrate the disasters which had overwhelmed his comrades!

Thus terminated the dream of the golden utopia; and with its sad tale of rash enthusiasm we close our sketches. If of less airy form than its predecessors, it was equally delusive as they, and infinitely more fatal to the enthusiastic spirits who adventured on its search—foremost and noblest among whom was our own gallant Raleigh. All the sufferings of those ardent adventurers—some in search of riches, others with the higher but still vainer dream of Eden in their hearts—hardly convinced them that El-Dorado was but a fiction of their heated fancy. Toiling onwards in courageous hope, everything seemed to them to announce their approach to the golden land: rocks of mica glittering in the sunbeams were its golden barriers, the hues of sunset were its gorgeous skies. But vanity of vanities was all their searching. Hunger, and pestilence, and fatigue thinned their ranks and bowed their spirits; and many a gallant heart, worthy of a nobler fate, thus fell a victim to its high-wrought fancies amid the wilds of Guiana—

'All o'erspent with toil and angulsh,
Not in glorious battle slain!'

THE CHAMBER OF REFUGE.

In the year 1783 there occurred in Sicily and the south of Italy one of the most fearful earthquakes on record. In this terrible convulsion perished upwards of forty thousand people. Mountains are said to have changed places; new rivers burst forth, whilst old ones disappeared; entire plantations were removed from the spot they occupied to one far distant; and the face of the country was so altered, that a native returning to it after a month's absence would not have had the most remote idea where to seek the home he had so lately left.

It is one of the most frightful facts connected with the history of mankind that occasions of this description are always more or less seized on for the commission of crime; and the robber and the murderer, reckoning on the impunity afforded by the universal terror and confusion, not content with the horrors of the time, add to them those of their own dark deeds. Many such instances of atrocity occurred at the period we allude to; and we are about to relate one of them, not for its own sake, since it is to be feared the incident was of too common a nature to merit particular notice, but for the sake of the influence it had on the fate of two innocent and estimable persons.

In the neighbourhood of Reggio lived the Marquis Agostino Colonna, a widower, who counted a long line of

ancestors, and had only two sons to inherit his wealth and his titles, the former of which was reputed to be very considerable; not that his manner of living countenanced this notion, but he had the reputation of being a miser, and was supposed to be hoarding immense sums for those much-beloved sons, the junior of whom was at the period of the earthquake residing in Paris with his young wife and child, as envoy from the Neapolitan to the French court; and this immense treasure was believed to be deposited in a secret chamber situated somewhere in or near the castle, but *where* no one knew except the marquis himself. In the disturbed times of our ancestors, such chambers were attached to many a baronial tower, either for the purpose of concealing treasure, or to serve as a hiding-place in case of danger, and as the value of the resource depended on the inviolability of the secret, the head of the family was alone permitted to possess it, with the liberty, however, of communicating it, whenever he thought fit, to his immediate successor.

In accordance with this custom, the eldest of the two sons, Count Agostino, was duly made acquainted with the family mystery; but in 1782 the young man being accidentally killed whilst hunting, Count Neocles became the heir. He being absent in France at the time, the old marquis, not choosing to commit so important a secret to the insecure post of those days, preferred writing certain directions by which the chamber might be discovered, depositing the sealed paper, with others of importance, in a casket, which, in case of his death, was to be opened only by his son. The marquis had a servant called Baldoni, who had been the foster-brother of the eldest son. To this man, in whom he placed entire confidence, he pointed out the casket, enjoining him, in the event of his the marquis' dying before the return of Neocles, to deliver it into his son's hands himself. Baldoni promised; but it appears that the idea of what the casket might contain had haunted his mind; and not the less that some inadvertent words dropped by the marquis led him to suspect that the key to the great family secret would therein be found. Nevertheless Baldoni might have continued honest had not a fatal temptation to be otherwise fallen in his way.

On the 5th of February 1783 an oppressive sirocco wind had thrown the inhabitants of the castle of Colonna into that state of languor so well known as one of its effects, when the marquis, who was confined to his apartment by the gout, summoned a young girl called Pepita, who had been a protégée of his late wife's, to come and sing to him. This girl had so exquisite a voice, that the manager of the small Opera company at Reggio had made her liberal offers to induce her to join them; but the marquis, by promising to provide for her at his death, persuaded her to remain where she was. She was gentle, cheerful, neat-handed, and pretty; and these qualities, together with the charm of her singing, rendered her very valuable to the old man in his declining years and sickness: inasmuch, that whenever he was ill—and he was subject to long and frequent fits of gout—she was appointed his special attendant; and in order that she might be always within call, he appropriated a small room adjoining his own to her particular use. On this fatal 5th of February, however, Pepita being as languid and incapable of exertion as her betters, had retired to this little apartment, locked the door, and thrown herself on her bed, where she lay silent and still, even when she heard Baldoni knock and say the marquis wanted her. He had scarcely quitted her door, concluding her to be elsewhere, when a strange sound arose in the air, and the castle began to rock to and fro like a ship on a stormy sea. At the same time a large beam that supported the ceiling fell, penetrating the partition wall, and bringing great part of the ceiling with it. A cry from the adjoining room alarming her for her master's safety, made Pepita rush towards the door; but it was so blocked up by the fallen beam that she could not reach it: whereupon she sprang to the hole in the wall, and leaping on a table, looked through. The marquis was stretched insensible upon the ground, evidently struck down by a heavy piece of cornice that lay beside him; and Baldoni, who had just

entered the room, was standing beside him. Pepita was on the point of raising her voice to ask his assistance, when she saw him rush to a corner of the room, open a press, take out a small casket, and hastily quit the room; the whole transaction being so rapid, that the girl had scarcely time to comprehend what she beheld till it was all over. Nor, indeed, had she much leisure to think of it, for the shocks succeeded each other with such rapidity, and the noise and darkness were so terrific, that she expected every moment to be her last; but, unfortunately for her, she was reserved for a worse fate. By sheltering herself under the beam, she escaped being crushed by the falling masses around her; and although the castle was destroyed by the earthquake, poor Pepita was dug out of the ruins alive, after lying under them for three days without food. A severe illness was the first consequence of this calamity; and the second was, that her hopes of a provision from the marquis were annihilated, he being found apparently crushed to death, and no will discovered. As Pepita had no friends, she was carried to a public hospital, temporarily arranged for the reception of the sufferers: and here, as soon as she was well enough to be permitted to see anybody, she was surprised by a visit from Baldoni. She had, during her confinement, had plenty of time to reflect on what she had witnessed; and an Italian herself, she was well aware of the danger she would incur, should the party principally concerned suspect her acquaintance with his fatal secret, until she had some one to protect her from his vengeance. She therefore resolved to preserve an unbroken silence on the subject till the return of the heir, Count Neocles; but, not doubting that the casket contained some valuables belonging to the family, she determined, on his arrival, to disclose what she had seen, and in the meantime to avoid, if possible, a meeting with Baldoni, apprehending that her countenance might involuntarily betray her. Nothing, therefore, could be less welcome than his visit, the more so as it was quite unexpected, and she had no time to compose her spirits or prepare her countenance for the interview. He spoke to her with considerable kindness—too much, indeed; for jealousy of her interest with the marquis had hitherto made him rather her enemy than her friend, and the altered tone alarmed much more than it encouraged her. He offered to supply her with anything she required; bade her entertain no anxiety with regard to her future subsistence; assuring her that although the marquis had left no will, he would communicate to Count Neocles his father's intentions in her favour, and her claims on the family; and finally left her, promising shortly to repeat his visit. And what rendered this sudden accession of good-will the more suspicious was, that during the whole of the conversation his countenance belied his words: no benignity was there, no sympathy, no pity. It was evident to her that he was racked with anxiety, and that, while he was speaking to her, his eyes sought to penetrate her soul; whilst she, terrified and conscious, could not summon courage to meet his glance.

Baldoni, on his part, left her, convinced that his worst fears were realised—Pepita knew his secret. He had expected no less. He had been foremost in the search for her and the marquis when it was discovered that they were both buried beneath the ruins: the one he knew to be dead, and he felt perfectly indifferent as to the other, till they reached the spot and found her alive. Till then, he had not believed her to be in that room; nor, in his haste and eagerness to fly, had he observed the rent in the wall made by the fallen beam. Struck with dismay when it was ascertained that she was there and alive, Baldoni had immediately retreated, lest the sight of him should have provoked her to an abrupt disclosure of what she had witnessed. It possibly might have done so; as it was, all she did was to point to the adjoining room, exclaiming 'My master!—my master!' And then, overcome by her sufferings, bodily and mental, she fainted, and in that state was carried to the hospital.

The unwelcome visitor soon returned; and she was more alarmed than before when she found that his professions of kindness were beginning to assume a more

special form; and that, whilst his stubborn features expressed hatred, he wished to convey the idea that he was in love with her. This was worse than all; and anxious to elude the persecution that she feared awaited her, Pepita quitted the hospital, and sought a refuge with a sister of her mother's, who had a son called Antonio, a fine young man, who earned his bread as a vinedresser. Antonio had long entertained a *tendresse* for his pretty cousin; but her situation at the castle, and the favour in which she stood with the marquis, had so far lifted her out of his level, that when she visited the cottage she was received rather as a superior than a relation. Besides, it was well known that Pepita was to be provided for: Pepita, in short, in the estimation of the poor vinedresser, was an heiress, and far above his aim. Now she was as poor as himself; and that event, which to her was the most severe misfortune, first awakened his heart to hope. Although Antonio had never told his love, Pepita was quite as well aware of it as if he had, and had been, even in her most prosperous days, extremely well disposed to return it. She was now doubly so; there was love on one side to propel her, and fears on the other. Once the wife of Antonio, she reckoned on being free from the persecutions of Baldoni, and she would have some one to protect her from his vengeance till the return of the new master. Young, innocent, and simple, and residing under the same roof, it was not long before the priest was spoken to, and the wedding-day fixed. How they were to subsist gave them little concern. In that mild climate human necessities are with less difficulty supplied than in colder countries, where more substantial shelter and food, together with fuel and warm clothing, are required. Besides, Pepita was well aware that she could gain money by her voice if she needed it.

Whilst these arrangements were making, she scrupulously avoided Baldoni, and she trusted that he knew nothing of her movements; at all events, he seemed to have intermitted his pursuit, and she almost ventured to hope that her alarm had been groundless. But she was mistaken: Baldoni had intermitted his pursuit, which had been prompted by policy, and not by love, because he had read in her countenance that it was worse than hopeless. He apprehended his perseverance might only have served to provoke her to some decisive measures against him, and therefore he forbore; but he had his eye upon her, was informed of all her movements, and cunningly penetrated the motive of her temporary silence. It is needless to say he hated her, and her husband no less, for he never doubted that she had made him acquainted with the fatal secret; and as there is nothing so cruel as fear, he would probably have hesitated little to take their lives could he have done it without danger to himself; but that being impossible, he hit upon a scheme for securing his own safety a thousand times more barbarous.

When the period appointed for the return of the marquis approached, Baldoni one day presented himself at the cottage of the newly-married pair, with a letter in his hand, dated from Rome, and signed Neocles Colonna. The epistle was addressed to Baldoni, and in it he was desired immediately to despatch Pepita to Rome, where he had procured an engagement for her to sing at one of the theatres on very advantageous terms. The writer then gave directions as to how she was to travel, adding, that if she had any relation who could accompany her, so much the better, as she might need a protector. Your husband will accompany you of course, said Baldoni.

That the letter was a forgery seems never to have entered the mind of the girl; and to dispute the will of the master would have been out of the question; whilst to have so convenient an opportunity of communicating with the count at a distance from Baldoni was very agreeable to her. As for her husband, no misgivings assailed him, for he was not aware of any reason for entertaining any; she having prudently resolved not to make him the confidant of her dangerous secret till the marquis's arrival. Baldoni, in accordance with the orders given in the letter, undertook to arrange everything for

their journey; and as quickly as their preparations could be made they started.

In due time, the marquis with his wife and son arrived; the latter a fine lad of twelve years of age. Baldoni shortly afterwards relinquished his situation in the family, and went to reside at a lonely village called Tempesta, where he associated with no one but his own household, which consisted of his wife and a lovely daughter, of whom he was passionately fond. As for Pepita and her husband, it not being the custom to interrogate great people about such matters, no inquiries were made respecting them; especially as the old woman, Antonio's mother, who was the only person interested in their fate, after a reasonable interval, received a letter announcing their safe arrival at Rome, and also their extreme satisfaction at their reception, and the engagement made for them. In less than three years after the departure of her son and daughter-in-law the old woman died; but as she had nothing to leave, there was no necessity for seeking her heirs; and thus, as is the way of the world, no more being heard of them, Pepita and her husband were soon as much forgotten as if they had never existed.

We must now request our readers to imagine a lapse of six years. Young Count Agostino, the son of Neocles, who was twelve years of age on his return from France, is now a noble, handsome youth of eighteen; romantic, bold, very fond of sport, and a capital shot. Adored by his father and mother, he enjoyed a great deal of liberty; and as there was very good shooting in the neighbourhood of Tempesta, he was in the habit of paying frequent visits in that quarter; on which occasions he frequently contrived to be benighted, and Baldoni's house being the best in the neighbourhood, he had an excellent excuse for making it his lodging. The fact was, that on one of these excursions he had met with Baldoni's beautiful daughter Lucia; and although she was some years older than himself, had fallen in love with her. Baldoni was perfectly aware of the effect of his daughter's charms, and instead of repressing, encouraged the attachment, allowing himself to indulge ambitious hopes of a union betwixt the young people; and although to any other person such a project would have appeared utterly absurd, Baldoni had his own private reasons for considering it by no means so desperate as it seemed. It is also not to be doubted that whilst his ambition on the one hand, and his paternal affection on the other, made him desire the match, the stings of conscience, which did not prompt him to restitution, were yet sufficiently troublesome to make him rejoice in an occurrence which would enable him to render back his ill-gotten gains to the family he had injured, by simply making his daughter heiress of his hidden treasures.

Ever since the death of the late marquis, a mass was annually performed for his soul on the anniversary of the earthquake; and this ceremony took place in the evening at Tempesta, in an old chapel belonging to the family of Colonna, situated on the sea-shore, which was especially dedicated to services for those who perished by sudden accident, whether by land or water. However little disposed for such solemn offices, the gay young Agostino was expected to be present at these rites; and it is scarcely a matter of surprise that, weary with his day's sport, he should be more inclined to indulge in a sly nap in an obscure corner of the chapel, than to listen to the prayers for the dead, chanted by the quavering voice of the family chaplain. At all events so it was; and on one of these occasions, so soundly did he sleep, that the whole congregation defiled out of the chapel without arousing him. Neither did any one miss him; his father and mother concluding that he intended to remain at Tempesta to shoot, and Baldoni, at whose house he had slept on the preceding night, taking it for granted that he had returned to the castle with his parents.

It was long past midnight when he awoke, and it was not immediately that he could recollect where he was; and when he did so, and comprehended his situation, he soon found that he must be obliged to content himself with his lodging for the rest of the night. There was light enough from the moon to enable him to find his way to

the door; but it was locked; and having called as loudly as he could, without obtaining any response, he made up his mind to the worst, and settled himself once more to sleep, till the sacristan, coming to sweep out the chapel, should release him in the morning.

He had, however, scarcely fallen into a state of forgetfulness, when he was once more aroused by a noise proceeding from the altar; and turning his eyes in that direction, he was surprised to perceive a man muffled in a cloak, with a lantern in his hand, who seemed suddenly to rise out of the earth. Amazed and alarmed, for the young man was without arms, he remained silently watching the stranger, who first stooped down, then blew out the lantern, and finally, with a stealthy step, crossed to the door of the chapel and went out, locking the door after him.

Who could this be? and what could he be doing there? The face of the stranger was undistinguishable; but there was something in the air and gait that put him in mind of Baldoni. Now although Agostino was after a manner in love with Lucia—that is, in love with her as great lords are in love with maids of low degree—he was far from admiring Baldoni, whom he thought a gloomy, forbidding man, and whose designs on himself he had penetrated; and it was therefore less difficult for him to conceive some evil purpose on the part of the ex-steward, than to imagine what that purpose could be. In vain he puzzled his brain to discover it; and morning finding him quite unsatisfied, he resolved that the matter should not rest there; and as, in order to facilitate his further investigations, it was necessary to be silent with respect to what had occurred, after examining the spot where the man had emerged, and finding nothing to explain his appearance, he climbed up to one of the windows, opened it, and letting himself carefully down on the outside, made his way back to the castle long before his father and mother were out of their beds.

On the following night, unseen by anybody, the young count repaired, well armed, to the chapel, to which, as the family had a private key, he had no difficulty in obtaining access. There, in concealment, he remained till dawn, without seeing anything of the mysterious stranger. For three successive nights he met with no better success, by which time he not only began to be extremely tired of his stone pillow, but he also began actually to doubt whether he had seen what he imagined he had, or whether the whole had not been a vivid dream. For several ensuing nights, therefore, he slept quietly in his bed; but as soon as he was thoroughly refreshed, his spirit of adventure returned, and his curiosity urged him to make one more attempt. It had been on a Saturday night that he had seen the stranger; a fortnight had now elapsed, and it was Saturday again; and with a strong presentiment of success, he started once more for the chapel, and having locked himself in, took up his position in an obscure corner near the high altar; and, sure enough, shortly after the clock struck twelve he heard a key turning in the chapel door, and presently he saw the same individual enter, with a lantern in one hand and a basket in the other. He walked straight up to the altar, near to where Agostino crouched, concealed by a pillar; and then placing his lantern and basket on the steps, he stooped down under the table, and took something which Agostino concluded was a key, since he immediately afterwards opened a door in the pillar adjoining that behind which the young man was concealed, and entering the aperture, shut it after him, and disappeared. In about half an hour he returned, with the basket still on his arm, locked the door, replaced the key, blew out his lantern, and left the chapel as before. Agostino not only now felt himself secure of penetrating the mystery, but he was also satisfied that the man was no other than Baldoni; and for the first time a recollection of the family tradition regarding the secret chamber, and the treasures it was supposed to contain, recurred to his mind. Baldoni had no doubt discovered it, and was helping himself to its valuable contents. It was a grand thing at eighteen to have found out this; and it would be still grander to complete the enterprise himself; and this he resolved to do. So he waited till the morning dawned, and then set

about searching for the key, and the door to be opened with it: but neither could he find, nor even the smallest trace of them. What was to be done? Go to Baldoni, tell him what he had seen, and insist on a confession? But how force him to it? He was a dark, silent, resolute man, and might prefer dying, and taking the secret with him to the grave. On the whole, Agostino thought a better plan would be to wait till the next Saturday, then place himself in ambush, and just at the moment that Baldoni had opened the door in the pillar, and was entering the aperture, to place a pistol at his head, and stop him; and to this scheme he adhered.

Accordingly, when the night came, he was at his post betimes. At the accustomed hour the chapel door opened, and, as usual, Baldoni advanced to the altar, stooped down, and then, turning to the pillar, stretched out his arm to insert the key in the lock. It had been the intention of Agostino not to stir till the door was open; but in his eagerness not to lose the opportunity, he moved too soon, and the instant he emerged from behind the pillar that concealed him, Baldoni, without pausing to see who the intruder was, drew a pistol from his bosom and fired; whilst at the same moment the young count, perceiving the action, levelled the one he held in his hand, and drew the trigger. The two reports were simultaneous, and both the combatants fell. On the following morning, when the sacristan entered the chapel, he found Baldoni and the young count both apparently dead on the floor; beside them lay their weapons, an empty basket, and an extinguished lantern. News was immediately sent to the marquis, who soon arrived with a physician. What could be the meaning of so extraordinary an incident nobody could guess. Why they should have been in the chapel at all, and still more why they should have shot each other, was altogether inexplicable. Lucia declared that she had no idea that her father was anywhere but in his bed; and that as for the young count, he had not been at their house for a fortnight or more. In spite of this, the conclusion to which everybody inclined was, that Baldoni had quarrelled with the count in consequence of his attentions to his daughter, and that, for some incomprehensible reason, they had met there to discuss the question.

In the meantime, whilst everybody was guessing and wondering, the physician declared that Baldoni was dead, but that Agostino, though wounded, was not dangerously hurt, and was suffering chiefly from loss of blood; and due remedies being applied, he was ere long restored to consciousness; but as he was exceedingly weak, talking was forbidden, and all inquiries as to the meaning of this strange event were deferred till he was stronger.

In the meanwhile there was nobody more perplexed about this affair than Lucia herself. Whatever the world might think, she felt assured that there had been no quarrel betwixt Agostino and her father about her; and a thousand circumstances recurred to her that had at various times induced her to believe that there was some strange mystery connected with that chapel. In the first place, she was well aware that double the quantity of provisions they consumed were weekly provided, and as regularly carried out of the house, to be given to the poor, as her father had told her; but who these poor were she had never been able to ascertain. Then, as for lamp-oil, the quantity that was bought and disappeared was truly astonishing; added to which, she not only was aware of her father's having at different times purchased coarse clothing which he never wore, but since her mother's death he had also desired her to procure complete suits of female attire, and even baby-linen of the same ordinary description, which she had done and delivered to him, but which vanished in the same mysterious manner. Many slight observations of her own had connected these disappearances with the chapel; and she never went into it without casting her eyes around in the hope of discovering some clue to the mystery; and finally, finding none, she concluded that some political offenders or state criminals, whom her father favoured, were concealed in the vestry room, probably with the cognisance of the marquis; and this last opinion was strengthened by her

knowledge of the sums of money her father expended, though whence he drew his funds she did not know. There was not only the amount lavished on provisions, oil, and so forth; but she knew that he had lately purchased an estate, although the transaction had been conducted with great secrecy.

On one occasion, too, when her father had been ill, and confined to his bed for some days, she remarked that he was suffering great anxiety of mind, and he was even once on the point of disclosing a secret of importance to her. He had gone so far as to swear her to secrecy, and had commenced his instructions, which were to the effect that she should fill a basket with provisions and a jar with oil; but there his communications stopped, and he said he would wait to see how he should be on the following day. On the following day he was better; and his health continuing to amend, she heard no more of the matter, whilst an attempt she once made to renew the conversation was too eminently unsuccessful to admit of her repeating it.

Reviewing all these circumstances, Lucia, who was a well-disposed girl, felt extremely uneasy. That these provisions and clothes were for some concealed fugitive she could scarcely doubt. In those days, too, and in that part of the world, such hidings were by no means uncommon. Supposing such to be the case, the supply of their necessities must now fail: she trembled to think what might be the consequences. Yet whom to apply to she did not know. She would have selected Agostino; but in the first place, he was ill; and in the second, she naturally concluded that the quarrel, if such there had been, must have been connected with this secret.

Thus perplexed, her first step after her father was interred was to send for the sacristan and question him: if there were any persons above ground in the chapel, he must know it. However, he assured her there were not; but he admitted that he had his own suspicions about the chapel too. He was not altogether ignorant of Baldoni's visits, though the latter had made it worth his while to be silent; and how he had obtained the key with which he entered he could not tell. The sacristan confessed that he believed somebody was concealed in a vault beneath the building, but the entrance to it he had never been able to discover.

'They will be starved,' exclaimed Lucia, 'if we cannot find it!' And terrified at this possibility, she resolved to take the curate of the village into her confidence. He, apprehensive of incurring too much responsibility, lost no time in applying to the marquis's confessor for advice. Now it happened, on the day before this visit of the curate's to the castle, that Agostino, being considerably recovered, and able to speak without inconvenience, had described the circumstances which had led to his being wounded, concluding his narrative with a request that no attempt should be made to penetrate the secret passage till he was well enough to accompany the explorers.

The intelligence brought by the curate, however, altered the case: there was not a moment to be lost: Agostino had no great difficulty in indicating the situation of the door, but where was the key? Baldoni had certainly had it in his hand when the ball struck him; and as he had not been able to move from the spot, the chances were, that it might be found near the pillar, and with that hope the two priests and the marquis started for Tempesta. On inquiring for the key, the sacristan said he had picked up a small one of a singular construction on the floor of the chapel a day or two before, and not knowing to whom it belonged, he had left it on the window sill; and there they found it.

The directions they had received from Agostino enabled them, after some seeking, to discern a small round hole in the pillar, into which the key fitted, and immediately a panel slid back, and discovered a flight of steps, which, having provided themselves with lights, they descended, till they reached a door which was locked; they were about to send for instruments to break it open, when, observing a hole like that in the pillar, they betwought themselves of trying the same key: the experiment suc-

ceeded; and a second door being opened in a similar manner, they found themselves in a kind of chamber about twenty feet square. It contained a bed and several articles of domestic use; whilst three individuals, huddled together, with haggard features and sunken eyes, sat crouching on the floor in the dark. These were Pepita, her husband Antonio, and a child born to them in their dismal captivity!

The poor prisoners were so reduced from want of food, and their senses so dulled by their long confinement, that at first they could hardly comprehend that relief had reached them. They had been two days without food or light, and had already quietly resigned themselves to the death which they believed awaited them. They were immediately conducted above ground, where every kindness and attention was shown them. It was remarked that the woman was much less blunted and stupified than the man, the influence of her maternal affections having operated favourably by supplying her with a constant source of interest.

As soon as they were in a state to be interrogated, Pepita, having just communicated what she had seen on the day of the earthquake, proceeded to mention the order she had received to join the marquis at Rome; and how, under the guidance of Baldoni, they had started on their journey, with a vettura provided by him. They travelled at a slow rate along the sea-shore, and had not been more than an hour on the road when a wheel came off, and they were invited to descend, and take shelter in a sort of grotto or hermitage close upon the shore, whilst the driver went to fetch somebody to repair the carriage. 'Here we waited some time,' continued Pepita; 'and as we had started in the evening, night soon came on, and after partaking of some supper, Antonio getting uneasy at the driver's absence, went out to seek him; whilst I, feeling excessively drowsy, stretched myself on the floor to rest. How long I slept I do not know; but when I awoke, I found myself in a place I did not recognise, with Antonio lying on the floor beside me fast asleep. There was a lamp burning on a small table, a bed in one corner, and the basket of provisions and wine with which Baldoni had furnished us for the journey, standing close to me. I tried to wake my husband, but could not; and being still overcome with drowsiness, I turned round and went to sleep again. The next time I awoke it was he that had aroused me.

"Pepita," said he, "where are we? What has happened?"

"I do not know," answered I. "We can't be at Rome; can we?" For my head was quite confused, and I did not remember well anything that had occurred since we left home.

'My husband's memory was very much perplexed too, and it was some time before I recollected how I had gone to sleep in the old hermitage, and before he was able to describe to me what had happened to him.

"After we had eaten some cold meat, and drank some wine out of our basket," said he, "I remember going out to look for Baldoni, but I could not find him; and a strange feeling coming over me, as if I were intoxicated, I returned to the grotto, where I saw you lying asleep on the floor. I believe the wine I had drunk had given me a relish for more, for I remember opening the basket, and applying again to the bottle. I must have drank a great deal, I am afraid, for after this, I cannot clearly recall what happened; only I think the Signor Baldoni came and said he was sorry for the accident, and that he would take us to a better place to pass the night; but which way he took me I am sure I cannot tell; but I suppose in the morning we shall learn where we are, and pursue our journey."

'I thought so too,' continued Pepita; 'and it was not till many hours had elapsed that any suspicion of foul play entered my mind; and when it did, I did not dare hint my thought to Antonio, till at length he himself began to be uneasy. Not that he had any suspicion of Baldoni; but many strange stories of travellers being betrayed into the hands of banditti by the vetturinos had reached us, and he was afraid we had fallen into some

such ambush. As for my own apprehensions, I confess I was afraid to avow them; for if they were well-founded, I comprehended that our case was desperate; for Baldoni must either intend to take our lives, or keep us in perpetual captivity, in order to insure his own safety.

'We had no means of computing time, but we fancied about twenty-four hours had elapsed since we awoke from our heavy sleep, when we first heard the sound of an opening door and approaching footsteps. By this time our lamp had gone out, and we were in the dark; but our visitor had a lantern, and I saw that my fears were verified—it was Baldoni. He brought us provisions and oil; but when we asked him where we were, and wherefore imprisoned, he refused to tell us. All he would answer was, that he was acting under authority, and that we should shortly be released. In this story he always persisted; and sometimes he gave us reason to believe that our freedom was at hand. He said we were to go by sea, and not to return to Italy under pain of death. I believe it was this constant hope of liberty that kept us alive through all these tedious years. We never wanted for food or clothing, nor did we suffer much from cold. Neither did any incident vary our sad life, except that once Baldoni exceeded the usual period of his absence by about twenty-four hours, which alarmed us very much, and himself too, I believe; for after that, he always brought us a larger quantity of provisions in case of any accidental impediment to his coming; and it is to this precaution we owe it that we are now alive.'

The history of the melancholy six years passed in this cruel imprisonment was comprised in these few words; and as Baldoni himself was gone, no further particulars could be collected. These vaults were the secret refuge known traditionally in the family, to which Baldoni had found the clue in the casket. The amount of treasure reported to be there had been greatly exaggerated; but a considerable sum had been always left in case some sudden danger should necessitate a precipitate flight, and of this Baldoni had possessed himself. There were three entrances or exits: one under the castle; one in the old hermitage by the sea-shore; and the third, as we have seen, in the chapel.

There was every reason to believe that the wine the unfortunate travellers had drunk was drugged; and it appeared evident, from a variety of circumstances, that the wretched man had intended to send them away by sea, after alarming them to such a degree as to deter them from ever attempting to return; but the difficulty of arranging the removal, and his personal apprehensions, had delayed the fulfilment of his intentions till he was himself cut off in the blossom of his sins; an event which would have insured the death of the poor captives, but for the singular train of accidents that led to their release.

It is needless to say that the sufferers were well taken care of for the rest of their lives; whilst Lucia, who was guiltless of her father's crimes, was, at the request of Agostino, respectably married, and sent to reside with her husband to Rome.

OCCASIONAL NOTES.

WHAT BECOMES OF DISCHARGED PRISONERS?

No one believes that imprisonment in the usual way produces reform; and the question, therefore, is highly interesting, 'What becomes of discharged prisoners?' They leave the jail without money, and without character, and are turned loose upon the world to seek a subsistence as they can. Their former haunts are the only places open to them, and their former associates the only human beings who do not turn away from them in terror or contempt. What resource have they? Is it possible for them to change their evil habits, and become good members of society? It is not possible. Crime is their destiny. Society has punished them for their transgression of its laws; its dignity is vindicated, its outraged virtue appeased; and having deprived them, by the stigma it has attached to their character,

of any possible alternative, it dismisses them to their old course of villany. Society has caught a wolf; and having punished its depredations by imprisonment, it gravely unlocks the door, and turns it out—with teeth, appetite, and instinct as sharp as ever—into the sheep-walk!

If the liberated prisoner is caught again, he is of course punished for his offences as before? Not as before. He receives a *heavier* punishment, because this is the second time; because he has yielded to an uncontrollable fate; because he has done what he could hardly by possibility avoid doing. The magistrate examines the record, discovers a former conviction, and is indignant at the depravity which took no warning, but on the contrary, after a wholesome chastisement, gave itself up anew to crime. The poor wretch is awe-struck by the dignity of virtue, and is too much abashed to offer even the poor excuse, 'But I was hungry—I had not a penny—no one would give me work—what could I do?'

In Manchester, we are told in the Daily News, it is the custom of the criminal class to celebrate the liberation of a comrade by a day of carousal. They wait at the door of the prison, carry him off in triumph, and thus guard against any extraordinary circumstance, any exception to the general rule, which might occur to save him. But of late years, it seems, an opposition has started; an influence of an opposite kind is lying in wait, and now and then a brand is plucked from the burning. This opposing force, it may be thought, is the respectable class of Manchester, who have thus arrayed themselves against the criminal class. Alas! no. The good angel is a solitary individual—a humble workman in a foundry, who obeys the Divine impulse without knowing why; and without a theory or a plan, neutralises alike the destinies of the law and the allurements of the law-breakers.

This individual is Thomas Wright, an old man of threescore-and-ten, and the father of nineteen children. The following account is given by the paper we have mentioned of the way in which his attention was first attracted to the prison world:—'There was a man of a sailor-like appearance who had got work at the foundry as a labourer; he was a steady and industrious workman, and had obtained the favourable notice of Mr Wright. One day the employer came and asked if he (Wright) was aware that they had a returned transport in the place? He had learned that the sailor was such. Mr Wright desired to be allowed to speak with the man, and ascertain the fact. Permission was given; and during the day he took a casual opportunity, not to excite the suspicions of the other workmen, of saying to the man, "My friend, where did you work last?" "I've been abroad," was the reply. The man was not a liar. After some conversation, he confessed, with tears in his eyes, that he had been a convict. He said he was desirous of not falling into ill courses, and kept his secret, to avoid being refused work if he told the truth. Wright was convinced that in the future he would act honestly, and repairing to their common employer, begged, as a personal favour, that the man might not be discharged. He even offered to become bound for his good conduct. This was ten years ago; and the prejudice against persons who had ever broken the law was more intense than it is now. There were objections; and other partners had to be consulted in so delicate a matter. Great numbers of men were employed in the foundry; and should the matter come to their knowledge, it would have the appearance to them of encouraging crime. This was on the day of paying wages for the week. Before night, however, Wright had the satisfaction to obtain a promise that, upon his responsibility, the convict should be kept. The following day Wright went to look after his protégé—he was gone. On inquiring, he found he had been paid off and discharged the previous night. It was a mistake. The first orders for his dismissal had not been countermanded, and gone he was. Mr Wright at once sent off

a messenger to the man's lodging to bring him back to the foundry. He returned only to say the man had left his lodgings at five o'clock in the morning, with a bundle containing all his property under his arm.' In short, notwithstanding every effort of this benevolent person to find him, the poor convict was never more heard of.

This incident made Mr Wright think as well as feel. The case was only a solitary one. He had been attracted to the man by the mere circumstance of their passing a portion of the day at the same work; but were there not hundreds of other cases, of equal exigence, which had as strong a claim upon his sympathy? He went to the New Bailey, and conversed with the prisoners, passing with them his only day of rest—Sunday. The jealousy with which the authorities at first viewed his proceedings was gradually changed into approbation; and at length, when a prisoner was about to be discharged, he was asked if he could find the man a situation. He did so. 'This was the commencement of his ministry of love. In ten years from that time he has succeeded in rescuing upwards of three hundred persons from the career of crime. Many of these cases are very peculiar; very few, indeed, have relapsed into crime. He has constantly five or six on his list, for whom he is looking out for work. Very frequently he persuades the former employer to give the erring another trial. Sometimes he becomes guarantee for their honesty and good conduct; for a poor man, in considerable sums—L.20 to L.60. In only one instance has a bond so given been forfeited, and that was a very peculiar case. The large majority keep their places with credit to themselves and to their noble benefactor. Most of them—for Mr Wright never loses sight of a man he has once befriended, through his own neglect—attend church or Sunday-school, adhere to their temperance pledges, and live honest and reputable lives. And all this is the work of one unaided, poor, uninfluential old man! What, indeed, might he not do were he gifted with the fortune and the social position of a Howard?'

There are probably very few Mr Wrights in Manchester or anywhere else; but there are hundreds of individuals in every large town in the empire who would cheerfully subscribe a small sum each to aid in the institution of a society for doing on a large scale what Mr Wright does with the limited means and power of an individual. This, we presume to think, would be the noblest of all charities. It would not, like some other public charities, including the workhouse, rob men of their social rights, and withdraw them from their social duties. It would restore to them the one by leading them back to the other; it would turn felons into citizens; and, in fine, it would save the country the expense of one or more new convictions and new imprisonments for every man rescued. Do not let us be told of impossibility, or even difficulty, in the face of the fact, that in ten years three hundred felons have been saved from a continuance in a life of villany by a poor workman in a foundry!

FURTHER PROGRESS OF ADULTERATION.

We have at various times referred to the processes by which articles of general consumption are adulterated; and we drew the attention of our readers lately to one—*mirabile dictu!*—of a beneficial nature rather than otherwise. This was the mixture of coffee with chicory, which, in proper proportions, improves the taste of the beverage, while it lowers slightly the price at which the article can be sold. We were not then aware, however, that chicory is *itself* the subject of large adulterations; and that, when advising the addition of two ounces of the powder to fourteen ounces of coffee, we could offer no security that our docile readers would not be thus indulging in a preparation of carrots, parsnips, and other vegetables, or old worm-eaten ships' biscuits, highly roasted and ground!

The best chicory is sold to the retailer at 45s. per

cwt., but he can obtain it as low as *fourteen* shillings—a fact which is tolerably significant of itself. Perhaps the cunning purchaser, however, may buy his chicory in nibs; but that is of no avail, for the nibs are plentifully mixed with a kind of bread very highly baked, and broken into pieces of the proper size. That our information on this subject is correct we have no doubt, from the result of an experiment we recollect making ourselves in London some years ago. We tried the admixture of chicory first in small proportions, and then gradually to the extent of a fourth part; but all in vain. The desired taste would not come, or anything like it; and we were at length obliged to have recourse again to a grocer who had acquired the reputation of selling *French* coffee, and who took care no doubt to supply himself with the *genuine adulteration*.

The only article the trade sells at a 'prodigious sacrifice' is sugar; and on this they make no scruple of submitting to a loss of 5s., 7s., or even 10s. per cwt. The custom, no doubt, commenced when sugar was dear, and brought in inadequate quantities into the market. Some speculative grocer, to tempt and secure his tea and coffee customers, submitted to a loss on the commodity requisite for these beverages; and this stratagem being of course imitated by his rivals, became a custom of the trade. But this cheap sugar was not cheap enough; and some enterprising dealers sought 'in the lowest deep a lower still.' They intermixed with it potato sugar and sago flour, and so produced an article which they announced with great truth as being able to 'defy competition.' The public, however, must share the blame with the grocers. They will not take the trouble of calculating what the fair remunerating price of an article should be, which they can easily do by adding the duty to the publicly-known price in bond, and allowing a reasonable profit. They demand what is *cheap*; and they pursue cheapness from shop to shop till they obtain adulteration. In this country of shopkeepers there is no demand that does not meet with an almost immediate supply. Do you desire cheap tea? How can that be obtained with a duty of 2s. 2½d. per lb.? Very easily. The used leaves can be collected in large quantities, and even after deducting the expense of manipulation, can be sold to you—since you must absolutely have it so—at 3s. per lb. Cheap coffee, we have already said, is a mixture of the ground berry with chicory, culinary vegetables, and ships' biscuits; but sometimes burnt treacle or sugar is added, which confers upon the beverage a strong and peculiar taste.

But perhaps you want cheap cocoa? Why not? A good dash among the powdered beans of baked flour, common starch, sago flour, or a dozen other things of the sort, properly coloured with red ochre, will give you at once what you want. Is the desideratum cheap pepper? This is easily manufactured of rice, linseed meal, and an article (a mystery to us) called African Powder. Cheap soda is simply Scotch and English soda intermixed. Must you have cheap fruit? In that case the obliging dealer will purchase for a trifle damaged raisins and currants, and give himself the trouble to have them well sodden in treacle and water. This will make them new fruit, and you will hug yourself upon your bargain.

But if the man sells cheap raisins in the natural state, is it not an imposition in him to charge dear for preserves? Your indignation recalls him to his duty; and since in buying marmalade you will not pay for the rind of Seville oranges, he sells this to you in the candied state, and gives you the pulp for your marmalade, intermixed with apples, turnips, carrots, and other wholesome, but not very expensive matters.

Cheap soap you readily obtain, but suffer, we fear, some disappointment in its use. The adulteration here is merely water, mixed with it during the manufacture. It is sold to you at a most conscientious price, and of course before it has had time to dry. Cheap butter is produced at your demand by the admixture of flour and water—pea flour with salt butter, and

wheat flour with fresh butter; the proportions being one-third butter, one-third flour, and one-third water.

Many of the above-mentioned articles are not, and could not be, sold to the retailer by the wholesale houses at as low a price as he charges to the public. The difference is in the adulteration; and we repeat, the public is as much in fault as the dishonest dealer. They will not give the fair dealer even the price which he himself has paid, and he is compelled either to cheat them or 'decline business.' But is it not lamentable to think that this system of fraud pervades a considerable portion of the retail trade of this great country, celebrated throughout the world for the integrity of her merchants? Who are the men who perform such juggleries? Are they the grave and sober citizens we see behind their counters, or passing, genteelly dressed, along the streets, or sitting, with reverent air, in their pew at church, or deciding upon far lighter crimes than their own in the jury-box? The imagination is confounded by such questions. We are ready to think that there must be a mistake somewhere; but the stubborn fact remains confronting us, that there are adulterations, and hundreds more than we have mentioned, and that there must, therefore, be hands to effect them, and retailers to sell with a guilty knowledge even apart from the manipulators themselves.

Such facts as we have stated throw an odium—in many cases, we believe, undeserved—upon those houses which profess to sell cheaply for the consideration of ready money. Would it not be worth the while of one of these houses to publish from time to time a list of wholesale prices (including the duty separately specified) and retail prices, thus showing the amount of profit they charge? Many higher businesses make no secret of their per-centages, and why should they hesitate—more especially since they are well aware that it is only a secret as regards them, because the public will not take the trouble of making the calculation for themselves? If this were done by a house of established character, whose profits were really fair and reasonable, it would convince the public of the stupidity and criminality of their incessant outcry for cheapness, and it would sink the dishonest traders into the scorn and infamy they deserve.

MR SMEE ON ELECTRO-BIOLOGY.

THE philosophy of the present day is characterised by the desire to investigate causes rather than to speculate on effects—objective takes precedence over subjective research; and the popular inquirer asks to be informed not only of what is *done*, but *how*? To talk of gravitation now-a-days is hardly safe; people want some more definite term: they would like to have an image, so to speak, of the abstract idea. Hence the multifarious attempts to explain and clear up the abstruse and undefined in physical or moral science.

Readers of the Journal can hardly be ignorant of the fact, that for some time past it has been considered that the life-principle manifests itself by an electric or voltaic process. In No. 57 (1845),* we published an account of Professor Matteucci's researches on the subject, in which, although the phenomena examined were clearly referable to voltaic action, yet the complete arrangement of the animal battery was not satisfactorily made out. But according to a work now before us, the title of which appears below,† there need no longer be a doubt upon this point. Mr Smee not only confirms the conclusions of prior investigators, he goes farther, and endeavours to account for mental as well as physical phenomena. 'The physiological matter,' he observes, 'required two lines of investigation: the one having reference to the ultimate structure of organic beings; the other to the actions tak-

ing place in them. . . . By the electro-voltaic test, the mechanism of nervous actions has been determined. . . . Whilst, however, electricity appears to me to be an important agent for the cure of disease, the cases in which it is especially valuable are comparatively few; and I myself regard the treatment upon general electro-therapeutic laws as more valuable than the immediate action of electricity itself.' Thus much premised, it becomes necessary to describe the battery: the author states that 'a central parenchyma,* a peripheral parenchyma, connected together, and each supplied with bright arterial blood, are necessary to life. It follows that bleeding causes death; that the supply of imperfect blood, such as carbonaceous blood, is insufficient to life.' Moreover, a destruction of the central parenchyma, by injuring the brain, or of the peripheral, by destroying the body, instantly prevents the manifestations of the functions of animal life. . . . Now a central apparatus, supplied with a peculiar fluid, a peripheral apparatus similarly supplied, the whole connected together to form one universal total, is the apparatus desired; and such an apparatus we have in a double voltaic battery. If we abstract the proper exciting fluid from either end, or substitute any other fluid, or destroy the structure either at one end or the other, or divide the connecting portions or wires, the effects proper to the apparatus will not be manifested, and the battery will be destroyed.'

That animal membranes and fluids may take the place of metallic plates, wires, and acids, is apparent from an experiment suggested by Liebig: a pile was constructed, 'consisting of disks of pasteboard moistened with blood, of muscular substance (flesh), and of brain. This arrangement caused a very powerful deflection of the needle of the galvanometer, indicating a current in the direction of the blood to the muscle.' On this Mr Smee observes: 'In the muscles we have a nitrogenised material which is acid; in the blood we have a nitrogenised material which is alkaline; and the connecting part or nervous fibres are neutral. . . . The periphery or body, therefore, consists of the muscular substance, forming one pole; the cutaneous tissues the opposite; the serous fluid, which lubricates the parts, being the electrolyte. The whole forms a voltaic battery, which I shall hereafter consider in minute detail as the Peripheral Battery.'

'From the peripheral battery two series of connecting media proceed—the first, the muscular nerves, or nerves supplied to the flesh; the second, the nerves distributed to the cutaneous textures. If we examine the nerve-fibres in recently-killed animals, we find that they consist of fine tubes containing a fluid, and lined with a peculiar species of fat, which may be obtained, from their prolongation into the brain, in large quantities, when the part is soaked in alcohol for a long period. In this structure we have all the conditions necessary to insulation—namely, a fine membranous tube lined with fat on its inner side, and containing a fluid in the centre; and such a structure, as far as electrical properties are concerned, would be analogous to a glass tube containing liquid.'

'If we follow the course of the nerves, we find that they are prolonged to the brain, and end in the gray matter, where they again come in contact with a large quantity of blood-vessels. As the two series of nerves are not immediately connected in the brain, it follows, according to the laws of voltaic action, that another battery exists there, which may be termed the central battery. . . . For the integrity of the circuit, it is essential that the peripheral and central batteries be perfect; that their connection be maintained; and that a proper exciting fluid, or bright arterial blood, be distributed to each part.'

Such is Mr Smee's view of the living battery: we come next to his detail of the mode of action. For this he proposes the term *Electro-Aisthenics*, or a study of the various organs of sensation; and these again are com-

* See also Journal, No. 167, 'Remarkable Electric Agencies.'

† Elements of Electro-Biology, or the Voltaic Mechanism of Man; of Electro-Pathology, especially of the Nervous System; and of Electro-Therapeutics. By Alfred Smee, F. R. S. London: Longmans. 1849.

* *Parenchyma*, in physiological language, is the spongy, porous, or membranous substance which forms the bulk of some of the viscera of animals (as the liver), and the tissue of the leaves and growing parts of plants.—Ed.

prised under a new terminology: Opsaisthenics, of sight; Ousaisthenics, of hearing; Gumaisthenics, of taste; Rinaisthenics, of smell; Caenaisthenics, of touch; and last, a *sixth* sense, Somaisthenics, or bodily feeling. Blood and nerve being present in a normal condition, the integrity of the various actions is assured. The eye, for example, is stimulated by light, leading to the inference of a photo-voltaic current. By means of various chemical solutions, the author establishes the fact artificially. 'Upon exposing,' he writes, 'the apparatus to intense light, the galvanometer was instantly deflected, showing that the light had set in motion a voltaic current, which I propose to call a photo-voltaic circuit.' The eye itself is tested by thrusting a needle through the choroid coat, and another into a neighbouring muscle, and passing the animal experimented on suddenly from darkness into light, when, if carefully conducted, a slight deflection of the galvanometer is the result. With the retina and blood of the choroid coat for the positive pole of the organ of vision, we find the iris and muscles of the eyeball and eyelids proposed for the negative. The phenomena of hearing are accounted for in a somewhat similar way; the poles being the auditory nerve and adjacent muscles. The specific action can only be determined by showing that sound effects a voltaic current; and then how various are its modifications! 'The range of sounds appreciated by the human ear consists of about 12½ octaves, and perhaps extends to the 32d of a note in those endowed with most perfect hearing. From this it follows that the human ear can distinguish about 3200 sounds; and therefore it would require 3200 poles for that purpose.' With respect to the organ of taste, Mr Smee assumes the gustatory nerve as the positive pole; and states that 'we may make a voltaic battery in which the circuit shall be determined by savours, in very different methods. For instance, if we place a little per-salt of iron, with two platina poles, in a V-shaped tube, and then drop a little infusion of meat into one side, a voltaic circuit will instantly be produced.' Next in order comes the sense of smell: and here the author supposes that odorous substances determine a voltaic current, by 'facilitating the reduction of the highly-oxygenated blood; and that the olfactory nerves constitute the positive pole of the battery. He then proceeds to establish a sense of feeling, Caenaisthenics, as distinct from Somaisthenics, or bodily feeling. The former, he says, 'is that feeling by which we derive certain impressions from without, and is never in our understandings confounded with a bodily feeling, or that sense by which we estimate the changes taking place within our own frame.' Thus Caenaisthenics may be excited by heat or cold, or by mechanical or other pressure; and it is possible to imitate this effect by varieties of voltaic apparatus. But it would appear that, in experimenting on the living body, muscular power must be exerted before the galvanometer marks any trace of a current, as will be understood from Mr Smee's statement. The subject under test was a 'black rabbit, into the *mas-seter* of which,' he observes, 'I introduced one sewing needle, whilst the second was placed in the subcutaneous cellular tissue. After leaving them for a few minutes, so that they might be in the same state, they were connected with the galvanometer without sensible deflection of the needle. After a few moments, the animal, not liking its treatment, made an attempt to bite my finger, and the deflection of the galvanometer instantly showed the mechanism of volition. I then gave the creature a piece of wood to bite, upon which it used all its power of mastication; and by catching the oscillation of the needle, a very powerful current was exhibited.'

We have thus, as clearly as the subject would well admit of, traced an outline of the author's peripheral battery: we now come to the details concerning the central battery. The author maps out the brain into different regions, separated by commissures: to the first, which repeats the impressions conveyed by the sensor, or aisthenic nerves, he assigns the term Phreno-Aisthenics: the second, or that by which combined impressions are retained, is Syndramics: third, the seeing of numerous

objects, or hearing of numerous sounds, conveys but one idea of sight or audition; the term for this mechanism is Aisthenic-Noemics: fourth, Syndramic-Noemics, for the ideas derived from combined senses: fifth, Pneuma-Noemics, for the notion of infinity: and lastly, to quote the author's own words, 'we have to consider from whence the impulse is sent for the brain to cause action: a study which may be conveniently followed under the term of Noemic-Dynamics. . . . The details are exceedingly difficult to comprehend in all their minutiae; and yet I trust, by passing gradually from the simple to the complex, the leading features of this wonderful and intricate apparatus will be developed; and though the exemplification of the structure of a single brain would occupy many acres, I can exhibit examples of the mode of acting in the several departments by ordinary voltaic combinations.'

'The requisites of action, blood and nerve, are found in sufficient abundance in the central battery or brain, as that organ is literally nothing but fibres and blood-vessels. The nervous fibres are so numerous, that no estimation could be given of the myriads of which the brain is composed; in fact the whole of the white matter of the brain is composed of nerve tubes.'

We believe it was Coleridge who once met a metaphysical serving-maid at a tavern in Germany, and was surprised by hearing her express her belief that every thought, idea, or impression received generated in the brain, remained there ever afterwards, each one stored up in a minute cell, and that good or bad memory would consist in the greater or lesser power of reopening these cells and making use of their contents. If science be competent to determine the point, she was not far from the truth. Mr Smee states: 'When a man receives an impression, it is not evanescent, passing immediately away, but it is retained in the system to regulate future actions. Now, in voltaic constructions, it is not difficult to produce an action which shall influence future motions, and thus exhibit the effects of memory.'

'If we take two iron wires, and place them in a solution of argento-cyanide of potassium, and direct a voltaic current through them, silver would be reduced at that wire constituting the negative pole. The two wires would be ever afterwards in different electric relations to each other; one would be positive, the other negative; and thus the effects of memory would be shown, and future actions regulated.'

As the nerve fibres all terminate in the gray matter of the brain, these terminations are taken to be the negative poles. In this way the entire body is repeated in the brain, which organ again is supposed to be double, and yet so constituted, that two impressions made at different parts of the body convey but one idea to the mind. Under the head of Syndramics the author shows that the large size of the brain, with its multiplicity of fibres and vesicles, is necessary for the reception of the endless variety of impressions made upon that organ. When it is remembered that twenty-four changes can be rung on only four bells, we may form some conception of the myriads of changes to be effected in the 2000 or 3000 elements from each organ of sense. Mr Smee considers that the brain 'probably contains room for all the most important, when packed and arranged with the absolute perfection manifested in all the operations of nature.'

Without following each step of the investigation, we may state that each portion of the brain, as enumerated above, is severally treated of in a somewhat similar process of reasoning. A few of the conclusions at which the author arrives will serve to show the mode by which he builds up his theory. 'The faculty of desiring,' he observes, 'resolves itself into a tendency to act, and is manifested when the central batteries are in a condition of excitement. Desire is to mental operations similar in all respects to tension in electric arrangements. When the desire is gratified, it ceases for a time. This phenomenon is similar to an exhausted battery in which arrangements exist for replenishing the exciting fluid; as in this case, after a time, the battery would again become active, and exhibit tension.'

Again—'I might dilate largely upon the mechanism by which pleasure and pain may be regulated; but it will be sufficient to give a single illustration of the most simple method in which, in the voltaic circuit, a strong impression might stop action. If a very minute piece of metal be placed in a glass of fluid as a positive pole, and a large current be passed through it, the metal would instantly be dissolved, and the circuit could not be completed by that road. What is true of solid poles is true of liquid poles, or intervening fluid; and where repair is constantly necessary, as we know it is in the brain, a strong impression would more than equal the ordinary supply, and thus action, through that combination, would be stopped. The effect upon the brain by a painful impression appears to amount to more than mere exhaustion, as the part seems damaged permanently, and the action through that road does not again readily take place.'

Next in order we come to Electro-Psychology or 'properties of the mind, deduced from the voltaic structure of the brain.' This portion of the subject involves many important considerations and metaphysical speculations. Mr Smee finds a process for every faculty, even up to the idea of immortality. 'We know,' he says, 'from the very organisation of our bodies, that we are immortal; that God exists; that there is virtue and vice; a heaven and a hell. Man, in every age, in every climate, is compelled, by his very organisation, to believe these first principles. . . . Electro-noemics,' he also explains, 'should be the basis of jurisprudence. It shows that crime and pain should be associated together at the same time, because a stronger result would attend punishment inflicted the moment the crime was about to commence. Such a course is suitable for the lowest intellects, or persons of the lowest mental capacity. When, however, good principles could be effectively instilled, they would control every action, and prove far more useful.'

'Electro-noemics also show that to produce a strong effect in future actions, a strong impression must be left on the brain. From this cause punishment should be inflicted upon a man in a healthy, vigorous condition, and neither ill-fed nor debased in energy; otherwise the impression would be transient or evanescent, and would not deter the party from the commission of future crime. Electro-noemics also indicate that slight and proportionate punishment invariably following crime, would have more effect than severer punishment, with less chance of its inflection.'

From the foregoing summary of Mr Smee's book, it appears to contain matter interesting to other classes of readers as well as electricians and physiologists; but we believe that the time is distant when legislators or philanthropists will discuss questions of social economy or politics in an electro-biological point of view. Still, we are willing to accept the work as another contribution towards an inquiry that has long engaged the attention of philosophers: biology, the science of life, is a subject of permanent interest; and if a writer do no more than provoke discussion, he may do that which will eventually elicit truth.

We here close our notice of Mr Smee's book with an enumeration of its further contents—points of the investigation into which we have not thought it necessary to enter. They are—Electro-bio-Dynamics, or the forces produced in the living body; Bio-Electrolysis, or the changes taking place in the human body; Electro-Biology of Cells, or the relation of electricity to growth, nutrition, and circulation; and last, Electro-Therapeutics and Pathology.

PARTING OF THE HINDOO BRIDE AND HER MOTHER.

[HINDOO girls are generally married at the age of five or six years, and remain under the paternal roof till they are eleven or twelve, when they are taken away by their wedded lord. The *suussoorie*, or mother-in-law, is held in universal detestation by the young Hindoo wife; for these women have generally great influence over their sons, are jealous of their affections, and misuse

their power, their ignorance making them unfeeling and tyrannical. As the uneducated Hindoo female has few resources, so her love of external adornment is greater perhaps than is generally ascribed to the fair sex, and jewels and silken shen constitute her most cherished day-dream. She dyes her feet with *alkah*, extracted from the Brazil wood, a lovely red. Cotton is steeped in this, and dried in the sun in thin patches like lint, and about the size of a dessert plate; in which state it is kept in the bazaars for the toilet of the Hindoo, whose delicate little feet, after being pared and scraped with a pumicestone by a professional female barber, are very tastefully painted with the cotton. The Hindoo females have generally fine long glossy hair, which is neatly plaited at the back of the head into a knot; the front hair is parted à la *Madona*; and the toilet is not complete without a stripe of *sindoor*, a red powder, where the hair parts on the forehead; and a *ticca*, or ornament of tinsel, or talc and gold-leaf—sometimes characteristic of caste. The rich have handsome ornaments of gold or silver, which are fixed to the forehead, and set off very much a fine Hindoo face, peeping out from under a white transparent veil. Tenderness for her offspring is the characteristic of the heathen mother: she lives for her children, and parting with them is almost death.

The *bunnia-bhow*, or *surroff's* daughter, also called *bhow-cottah-cow*—('Speak, daughter-in-law; speak!')—from its saying these words in a mournful manner chiefly during the lovely moonlight nights of the East, is, in its own climate, as interesting a bird as our 'visitant of spring.' The *bunnia-bhow* is of the Oriole tribe; and its yellow plumage, varied with sky-blue and white, is greatly admired. The Europeans sometimes style this lovely creature 'the mango bird,' as it makes its appearance when that fruit is in perfection.

The Asiatic connects no romantic feelings with the turtle-dove; on the contrary, from the following conversation, it will be seen how our favourite in all tender matters is looked upon; she, too, is metamorphosed into a wicked penitent, doomed to proclaim her own sins, and to wander through ages to come over the wide world.]

THE HINDOO MOTHER AND HER DAUGHTER CHANDIKA.

Mother. My dear Chandika, you look very dull to-day, and your fingers are very slow. See, I have finished for you the wreath of *bokool* blossoms I began; and there is your string, and the little stick to string the flowers with. Look how pretty these *champas* will be in your black hair: they are like gold!

Chandika. Oh, mother, I can do nothing! Must I not soon leave you? That odious emissary from my husband's house, is he not to be here this afternoon with a *doolie*? And then, my own mother, I shall be under a *suussoorie*!

Mother. Dear Chandika, every Hindoo girl is disgraced if she has not a husband and a home to go to. You must look to your lord, *Rajhissur*, for protection. I saw him, and I am not deceiving you; he is kind, young, and handsome; and your mother-in-law is not such a firebrand as you suppose.

Chandika. I don't know: I hear all the young wives who come to our tank for water at noon, and every one is louder than another in invectives against her *suussoorie*. Oh I wish never to leave you!

Mother. Come, let me see your feet. Has the *naptanie* painted them neatly with *alkah*? And are the flowers nicely done on your insteps?

Chandika. Oh dear, yes: she is the handiest *naptanie* in this village. See, my hair is all oiled and plaited, and I have gummed on my *ticca*, and tied on the frontlet of gold; so there remains little else to do to my toilet.

Mother. Come, then, now, and put on your gay new red *saree* of rustling flax: it has cost six rupees, and it is one of the best. Your bracelets (*cangoons*) and armlets (*bazonbands*) are all pure silver, and your nose-ring

is Rajhissur's most valuable gift: the pearls in it are of a fine lustre, and the garnets are sparkling.

Chandika. But my eyes are heavy, and my spirits are dull. Last night, although I did not disturb you, I went under the niem-tree; and there, as the moon shone brightly, I listened to the beautiful bunnia-bhow reiterating her sad notes. Was she not once an odious mother-in-law? And did she not cruelly knock her son's wife on the head for leaving an assigned task unfinished? The soul of the sussoorie should have been put into an owl instead of the yellow bunnia-bhow. Well, I fell asleep at last, and at sunrise I was awakened by the cooing of the turtle-dove. Oh, it kept wailing, 'Bow outtoo, poora pooral!'—('Rise, daughter-in-law; the measure is full—is full!') She, too, was a cruel wretch, and killed her young bow for not pounding and filling a certain measure of rice fast enough; and for that crime she has been transformed into a dove, and can never forget her wicked deed. Oh these odious mothers-in-law!

Mother. Come, dear Chandika, my fair one; come, forget all this: I shall come and see you at the *Door-gapoojah*. How well you look in all your new things! Your skin is as clear and beautiful as the fresh peel of an onion just drawn out from between its flakes!* But there, behold, there comes your father, and the old Brahmin agent with him. Cover your face, and do not cry; I must go and cast myself at the *thagoor's* feet. Let us embrace, my own Chandika; my only child, I must away. [*She prostrates herself at the Brahmin's feet.*]

Brahmin. Good woman, arise. Where is your daughter? The *sewahree*† waits, and we must reach Burdwan to-night: so bring out the young wife. I am answerable for her.

Mother. Just as you please, maharaj. [*Chandika is brought out, covered and veiled, and placed silently and sadly in the litter. The mother is left gazing, until the sewahree diminishes to a speck; then her grief breaks out in loud cries and lamentations.*]

OUR CORRESPONDENTS

ARE as numerous as ever, and nothing gives us so much pain as the continual rejection of papers in prose and verse, written with an apparently earnest wish to succeed; and though not exactly up to the mark, yet occasionally manifesting no small amount of taste and ability. An editor, however, must have no compassion. He stands himself before a critical tribunal, and requires to act with scrupulous indifference in rejecting what seems unsuitable. At the same time, we are of course anxious to help on aspirants for literary honours, and a word of counsel and kindness to the deserving is not wanting where it can be of service.

Correspondents, however, who favour us with hints on miscellaneous topics, are perhaps still more numerous than those who send us papers for consideration. Sometimes these communications are of an amusing kind. They reveal what seems to be the ruling passion of the writer, and go pretty far to give one a notion that society abounds in people each mad on one idea; and all thinking everybody else crotchety and unsound but themselves.

The following candid announcement, enclosed to us under cover, will be received with much satisfaction by the world:—

'The hour is come, but where is the Man? He is ready when he is wanted! Fourteen years have I waited and watched the progress of events, since I first received the impression that on me depended the regeneration of my country. *Mihi omnis spes in memet sita.*

* This is thought a great compliment in the East.

† Procession or cavalcade.

[All my hopes are centered in myself.]—OLIVER (not Cromwell).'

A correspondent, who writes from Birmingham, suggests our giving our opinion on a matter of great delicacy and importance:—

'GENTLEMEN—You would very much oblige a great many of your readers if you would please give them your opinion on Marriage in your Journal. Is there, generally speaking, more happiness in a married or single state? Do you think that men who do not marry till they are thirty-five or forty years of age, would be happier if they did not marry at all?'

Answer—Let all bachelors marry as soon as possible; the older they are, the more expeditious they should be.—Not a bad picture of matrimonial felicity is presented in the following lines from a poem, 'Hours of Solitude,' just handed to us by the author, who tells us he was lately a private soldier:—

'Behold the hardy tiller of the soil,
The humble peasant, born to daily toil,
With what delight, when sinks the setting sun,
He hies him homeward, all his labour done.
How joys to know, attending his return,
The board is spread, the blazing fagots burn;
But sweeter still his gentle wife will wait
His weary footstep at the garden gate.
He thinks how she, through life's oft dreary hours,
Has strewn his path with love's unfading flowers;
He thinks, though providence to him denied
The glittering splendour of the sons of pride,
He is not poor, for thus, his own to prove,
The unequalled treasures of a virtuous love,
Is greater wealth, and purer rapture brings
Than all the glory, all the pomp of kings.
Such are his thoughts, as 'neath the rising ray
Of the pale moon he slow pursues his way.
Well knows his wife th' accustomed step, before
The latch is raised, or opens the cottage door.
He enters! see, her eye, for ever bright,
Now instant kindles with a clearer light;
And oh! how soon, before its smiling ray,
Fade all the cares and labours of the day.
Soon as their prattling babes to rest retire,
They sit discoursing by the cheerful fire;
In converse sweet, each kindred feeling share,
Illume the moments, and forget their care!

* * * *

Oh! prize that worth, and bless indulgent Heaven,
Whose bounteous hand a kindred heart has given,
Life's rough and dubious paths with thee to share,
Increase thy pleasures, and divide thy care!
There is a charm that words can ne'er reveal,
Known but to those who all its pleasures feel,
When some dear being sheds a lustre bright
Around our home, and fills it with delight.
When friends are near, we feel with lessened force
The little cares that cloud our daily course.
Thou shalt thou own when, partner of thy home,
Thou lead'st the maiden to thy peaceful dome;
And loved, and loving, prove, in every hour,
The calm pure pleasures of affection's power;
True joys, indeed, which shun the noisy haunts
Where riot reigns, and dissipation flaunts.
Nor deign to smile amid the thoughtless throng
Gay folly draws in flowery bands along.'

One who signs himself a 'Constant Reader' is concerned on a subject eminently deserving the attention of the social economist and the theologian:—

'GENTLEMEN—I think you would confer a great benefit on the male portion of the community if, in your able Journal, you would advocate the ancient custom of wearing the beard and moustache. I think it can scarcely be consonant with the design of Providence that we should addict ourselves to the practice of shaving; for if the beard was not intended to be worn, why does it grow? Shaving, therefore, is surely irreligious, and a violation of the conscience. I would suggest that there should be an Anti-Shaving Association, which, if properly begun, would soon get plenty adherents. Pardon the liberty of drawing your attention to this far from unimportant subject.'

The above sagacious proposition would scarcely please the razor and strop-making interests; which are, by the way, very active and stirring interests indeed. Some months ago, we received a specimen of G. Saunders's (of New York) Razor-Strop, certainly an advanced species of its class, seeing that it is a four-sided article, having a hone on one side, and leathern strops of graduated smoothness on the remaining three. More lately, there was submitted for our approval a droll-looking razor called the 'Plantagenet Patent.' What the Plantagenets had to do with the affair is beyond our comprehension, as we rather believe shaving was not fashionable in their day. However, that is not the point. What invited notice was the *principle* of the instrument, which gives the power of shaving without the possibility of cutting the skin. This desirable end is achieved by fixing on the side of the blade a guard resembling a metal comb, the teeth of which project a little beyond the edge. By holding the instrument at the right slope, shaving is at once effected; but if held at a wrong angle, the teeth of the comb rest on the face, bearing off the edge of the razor, and the chance of cutting is thus effectually prevented. This razor is really a very clever thing, and will be of great use on shipboard, or for people with unsteady hands; indeed there is nothing now to prevent any one shaving himself in the dark, or in a railway carriage going at the rate of fifty miles an hour. What next?

Of all the strange presents sent to us editorially, the most strange was that of a trap to place on the mouths of drains, in order to prevent the escape of bad smells! Fortunately, we had no reason to call this patent engine into operation, and are therefore unable to speak of its merits. The authorities of Gwydyr House would be competent to pronounce on the subject *ex cathedra*.

In this category of correspondents we may place one who subscribes himself a 'Hosier in the Midland Counties.' This tradesman begins by complimenting us on a late article, which hinted, in the most remote way possible, at the fashion among ladies of wearing inordinately long petticoats; 'a fashion,' proceeds the hosier, 'that has rendered our business almost good for nothing. Formerly, ladies bought, according to their circumstances, very elegant stockings, both silk and cotton. Hundreds of men were employed in weaving, and women in embroidering. Even servants and country girls prided themselves on a nice clean pair of good stockings, and a pair of neat shoes. What could look so beautiful as a handsome ankle and foot in a white stocking and black shoe, either crossing the street on a bad day, or tripping along the floor of a ball-room? I am sorry to say you never see anything of the kind now. I might as well shut up shop. Ladies are contented to wear sixpenny and ninepenny hose, and none of any account above two shillings. In the streets they go dragging along with ugly dirty boots; and in a ball-room you cannot tell whether they wear any stockings at all: the dresses are so long, that the room is in perpetual dust; and the gentlemen, in dancing, treading upon and tearing their clothes, and apologising. I could weep for the hundreds it has thrown out of employment, and the trade which it has ruined. The gentlemen, also, should never go into even a dining-room where there are ladies, much less a ball-room, with boots; for let them be ever so thin, they are boots still. A pair of nice black trousers, and either black or some choice (not vulgar) fancy silk stockings, with a pair of neat shoes, either tied with a bow of ribbon or a buckle, would make a man look like a gentleman if he was really not so; and then the comfort and ventilation he would have when dancing! Pray, gentlemen, take the few hints I have hastily set down, and publish, ere long, a good article on the abomination of boots and long petticoats.'

A late article, 'Hoodless, the Horse-Swimmer,' has called forth several communications, from which we select the two following:—

"Hoodless, the Horse-Swimmer" is the heading you gave to an interesting anecdote in "Chambers's Journal;" you will be pleased to know that an occurrence similar to that narrated took place at the Cape of Good Hope. Many years since, a ship was lost during one of the tremendous gales that visit the "stormy Cape." The crew and passengers were in imminent danger of perishing, when a farmer dashed into the surge with his horse. The brave adventurer reached the ship, and returned in safety with one or more of the mariners clinging to his steed. Again he perilled life with the same fortunate result. A third and a fourth time did he risk himself in the waves, on each occasion saving one or two, till eight altogether were rescued. On the fifth attempt he was less fortunate. Whether from fatigue, or the violence of the surge, he lost his seat. His horse returned to the shore riderless! The gallant farmer perished. A monument, I believe, marks the spot, and recalls an incident honourable to humanity.'

THE LIFE BOAT.—'It was about the year 1783 that a ship ran upon the hard sand at the mouth of the Tyne. The sea was running high, and no boat dared venture out to the relief of the crew, who, taking to the rigging, were distinctly seen by observers on shore. For several days the storm continued unabated, and the poor wretches were seen morning after morning still clinging to their only remaining hope. At last, from sheer exhaustion, they dropped one after another into a watery grave. The people on shore watched them even to the last: he also fell, and no one was left.

'How different is the state of things at the present day! Let us fancy ourselves standing on some rising ground at the mouth of the same river Tyne: a violent storm from the north-east lashes the sea into a fury; a ship is observed making for the harbour; perhaps a signal of distress may be flying from the mast. How many anxious eyes are watching her from both sides of the river, as she rolls and plunges in the boiling waters! She takes the bar, when suddenly, from some cause or other, her course is altered (maybe she has unshipped her rudder), and she runs direct upon the hard sand, where every sea that strikes her washes the deck, and sends the snowy spray far above the mast-head.

'Now is the hour of peril; the life-boat is manned; she sweeps along with incredible speed; no clockwork can be more regular than the steady stroke of her double-manned oars. She dashes into the breakers, at one time looking as if she would throw a somerset, at another lost to the eye in the trough of the sea: she reaches the wreck, takes out the crew, and returns. As she comes near home, the crowd upon the beach follow her, cheering as they go; the crew is landed in safety; three hearty cheers are given, and that is all.

'For those unacquainted with nautical affairs, it may be necessary to say, that before the invention of the life-boat no boat was found that could live in a heavy sea: all boats of ordinary construction being liable to turn bottom up, and remain so. From the shape and make of the life-boat, there is no chance of such a thing: being made high at stem and stern, she resembles, when viewed in profile, nothing so much as a crescent with the horns uppermost. Beneath the gunwale is a broad layer of cork for the sake of greater buoyancy; and she is provided with air-boxes, &c. for the same purpose. It is customary to lash or tie the rowers to the thwarts or seats, which is sufficient to give one an idea of the danger of the undertaking.'

The following letter, written by a person in the country to her friend, a lady in Edinburgh, was lately put into our hands, and speaks for itself:—

'DEAR MARY—I heard a circumstance to-day, which gave me so much pleasure, that I cannot forbear mentioning it. Some time ago an English gentleman, Mr —, was travelling in a railway-carriage, and to amuse himself he had purchased two or three of Messrs

Chambers's publications. An article in one of these attracted his attention: it was showing the great necessity for Life Assurance. Soon after, when his tenants were all dining with him, and paying their rents, he read the article aloud to them, and recommended to them to insure their lives without delay, as it would be a good thing for their families after their death. His land-steward was so struck with what he heard, that he insured his life directly. This man, I am told, is now dying, and has the greatest satisfaction in knowing that he leaves wherewith to bring up his family. He is a Scotsman, and feels a strong desire that his boys should be educated; for if he had not got education himself, he would still have been a Roxburghshire ploughman. Well, as I understand, his sons are to be sent to Scotland to their schooling in a plain way; and this could not possibly have been done but for the life assurance. The poor man is said to be quite happy that he acted on the advice given him. I daresay Mr Chambers will be glad to hear of this instance of good being done by one of his articles.

Novelty is the order of the day. The 'Proprietors of Hall's Wisbeach Sewing Cotton' have become publishers of a tiny periodical called 'The Olive Branch, a Journal for the Work Table,' which they distribute gratis along with their reels. When literature is thus made an associate of threads and needles, one would think it cannot help going off. As a specimen of the Wisbeach sewing-cotton periodical, we present the following from the number for March:—

'MOCK DRAPERY AUCTIONS.—There are few more profitable employments, to persons roguishly disposed, than buying a quantity of inferior drapery, generally the clearance of old stocks, and then travelling through the country to sell them. Mock auctions are a very favourite mode adopted, and are usually announced by some specious advertisement of "wreck," "contraband seizures," or other equally imposing terms. Candle-light, which obscures so many imperfections, is frequently employed at these sales. To avoid the impositions practised on such occasions, we would recommend those who are disposed to purchase to make a visit by daylight, as they would ordinarily do with the draper, and before purchasing, look carefully at the class of goods offered for sale. There is also an efficacious mode of ascertaining the value of piece goods. Ask some respectable draper for a few patterns, which he will generally furnish with pleasure, and compare them with those of the itinerant merchant. It is our belief that in almost every case the goods of the resident tradesman will be found much the cheaper of the two. The favourite plan of these systematic deceivers is, in the first instance, to offer something exceedingly cheap, and by that means decoy as large a company together as possible; their inferior commodities are then the more easily palmed upon the buyers. The active agency of a few allies purposely employed to secure the highest prices, for *bonâ-fide* sales, secures also the withdrawal of any articles the public are likely to obtain too cheap. It is to be remarked that the goods generally sold consist of shawls, woollen cloths, and other expensive articles, the value of which it is difficult for the most experienced accurately to determine. In purchasing articles of fashion, our female friends generally desire to have the greatest novelties, and shawls are perhaps one of their most important items. Now there is no way to form so sure an opinion on this subject as to notice their condition. You will usually see the goods of these travelling auctioneers have been folded time after time, and the creases are so many, that you with difficulty discover those originally made by the manufacturer; hence, we should say, especially notice their condition. As to woollen cloths, when in their finished state, the face being raised, it requires much judgment to tell the fineness of the yarn of which they are made—and the whole value depends on this—and the soundness of the wool. If there is one article more than another which requires to be purchased of a

tradesman of character, it is woollen cloths. Any complaint would be sure to be attended to by him; and by advising the manufacturer, with sufficient proofs that the damages were occasioned by his mismanagement, any necessary compensation would be allowed. There are few, when buying, who would calculate on seeing their auctioneer friend again if required, and fewer who would ever expect, if they found him, any allowance for damages.

'We should be sorry, by these remarks, for any to suppose that we do not wish them to buy at the cheapest market. Our only desire is, to point out the fallacy of supposing that persons depending for their livelihood on the precarious sales of a few days, at very indefinite intervals, and incurring travelling expenses, can compete with the regular tradesman. It must be remembered that the latter has a character to sustain, and that his constant attention is given to select those articles that are most in request by his circle of friends.'

We close for the present this word about our correspondents by submitting the following letter, just received, to the sagacity of the reader:—

'When you see the signature at the conclusion of this, you will probably recollect having received communications from me before. It is with deep interest that I see occasionally appearing in your numbers the earnest yearning for more light and truth. I find that the putting of pen to paper for the purpose of writing a concentrated article for publication—suitable for the public eye—does not draw—the effort will not yield. I require a leading-string: I acknowledge to myself to be guided by the spirit. Far removed from literary circles, I necessarily draw deeply from the original fountain of truth for those intellectual and spiritual pleasures, the former of which I confess I believe comparatively few of my fellow-beings would be able to afford me—that is, when the subjects nearest my heart, and of the highest character in truth, were to come under notice. Subjects of paramount consideration to the whole of the human race are not likely continually to give place to those of a more trivial, though of a perfectly innocent and suitable character in their way. Without any pretensions to deep learning, in the ordinary acceptance of the term, and which I consider likely to become an encumbrance rather than an aid in all that is truly valuable in lore, I have seen much of life and business, and into the recesses of the human heart, if I may use the term; indeed I have been led about and instructed in the arduous and painful career which thus far it has pleased an all-wise Providence to carry me through. When I commenced this, I was almost as ignorant of what the contents were likely to be as you were when you commenced reading, with the exception of a prevailing desire to open a vein by which I might communicate with you.

'I was induced to make the attempt, as (being requested by a sister to write to her) on Saturday evening I wrote in a few minutes, without any effort, something I have since thought might do for your Journal; and yet, had I sat down to write for that purpose, I could not have done it at all.

'I find that with me my sentiments can only be communicated easily and agreeably by letters or conversation: the latter is preferable when attainable, and the parties are perfectly at ease, able to reciprocate, and each equally open to receive the impressions of truth in all its simplicity, copiousness, and power. I will endeavour to call to mind the extract, which, with a few preliminary remarks, constituted the whole of my note.

'I believe that in any attempt to produce a formal article I cannot get on, because my thoughts are too big, too brief, and too concentrated; and though conscious that my spirit is pregnant of unutterable things, it finally says "Peace, be still." Who knows but that the sister who drew out the following may prove the midwife called in preparatory to your more able and skilful accoucheurs.

'I find that I cannot renew the essay to my sister,

therefore I beg to refer you to her address for a note written on the 31st March 1849, from yours truly.

This note would doubtless be worth perusal, but the world moves so rapidly, that we cannot wait for it.

ALLIGATORS BOARDED AND LODGED.

We made an excursion lately to what is called here the 'Muggur Tank,' a lake of alligators, which lies in a small and beautifully-situated grove of trees, surrounded by a range of low hills, about nine miles from Kurrachee. After having breakfasted, we proceeded to the spot where these hideous monsters are congregated. They are held sacred by the natives of the country, and are regularly fed by the contributions of devotees. The tank is more like an over-flown meadow than a lake, having deep channels intersecting each other, and is literally alive with these huge 'muggurs,' some lying basking on the knolls and ridges, others floating on the surface of the deeper water. They are of all sizes, from a foot or two to twenty or twenty-five feet in length, and bulky in proportion. Having purchased a kid, and cut it up on the banks, there was a universal opening of their capacious jaws, which they kept distended in expectation of having a piece of flesh pitched into them; they are too lazy and too well fed to make any further demonstration: the native keeper, who feeds them, then began calling to them, when they came one by one lazily along, and waddling on to the shore, each took what was given to him. The rapidity with which the poor kid vanished, head and heels, was truly surprising. They know the keeper quite well, and if any one should take up what is not thrown to him, the keeper makes him drop it by striking him on the snout with his stick. Their jaws are certainly dreadful clap-traps, and the crash they make when brought together is horrible, crushing the bones even of the head of their prey like so much crust. It is probable, setting aside motives of superstition, that the inhabitants now find it necessary to feed these voracious monsters, for were the 'supplies to be stopped,' they would become dangerous neighbours. In fact they do at times pick up and devour a stray child left on the banks by accident or design. There are here three hot springs, one of which supplies the tank, and is of a temperature of about 96 degrees. The two others have a temperature as high as 180 degrees. The water issues from the rock as pure as crystal, and in great abundance. The females of the country repair to these springs after their confinement, to perform their ablutions, and to present their sacrifices to the 'muggurs.'—*Anglo-Indian paper.*

OCEAN PENNY POSTAGE.

Our friends in America are awaking up to this subject. They are determined not only to have *penny* postage from the Atlantic to the Pacific, but also across the Atlantic to the old world; and all to be established by the United States. So the question will soon be, whether Uncle John Bull or Brother Jonathan shall carry letters across the Atlantic for a penny a-piece. Jonathan can do this, and would do it, if the world should challenge him to do '*something smart*.' But Uncle John ought to do it before any one else in the world. He owes it to the colonies which he has planted all over the globe—to the millions of his children which he has sent out to live in the islands of all the oceans and seas far and near, and who want to write home every week. That is the ocean penny postage the world wants: not a penny postage across the Atlantic, from Liverpool to Boston, but a penny postage across all oceans and seas. Brother Jonathan is smart for his age undoubtedly, and would do a great thing for the world if you should once 'raise his dander' in the right direction. But we fear his purse is not long enough, nor his ships numerous enough, to establish a universal ocean penny postage. This is Uncle John Bull's mission, and we must all put him up to its fulfilment. All his children and grandchildren, nieces and nephews, at home and abroad, must tug at his skirts in their most winning way, and with filial faith and hope smiling in their eyes, meet him by the wayside, and fireside, and in all accessible moods and conditions, with this question—'*Uncle John, when will you give us an ocean penny postage?*' Don't be discouraged if he *pooh poohs* at it at first, and buttons up his pockets, and talks about hard times, and all that. Keep at him steadily for a year in this way, and, like all other good-natured uncles, he will give in. Then what a jubilee there will be in thousands and tens of thousands of homes separated

from each other by a thousand leagues or more of sea! Oh, Uncle John! the world would forgive you for all the unpleasant accidents you have occasioned in apportioning so much of this globe to the members of your family, if you would but give to mankind an *ocean penny postage*.—*Burrill's Christian Citizen.*

A FEW SHORT YEARS.

A FEW short years—and then
What changes Time hath wrought!
So strange they seem, we scarce can deem
The world, our life, ourselves are aught
But one long fitful dream.
The clouds that fly
Across the sky,
Waves tossed upon the sea,
Shadows that pass
Before a glass,
Our fitting emblems be.

A few short years—and then
Where are the hopes that shone
When youth with flowers enwreathed the hours,
And earth had but one music tone
Of joy for us and ours?
The rainbow's hues,
The morning's dews,
The blossoms of a day,
The trembling sheen
On water seen
More stable are than they.

A few short years—and then
Where is the ad'mant chain
That passion wrought, and madly thought
Nor time nor change could ever strain
Till life's last strife was fought?
A rope of sand,
A goss'mer band;
The filmy threads at e'en
The spider weaves
Amongst the leaves
A firmer bond had been.

A few short years—and then
Where is Ambition's pile,
That rose so high against the sky,
O'ershadowing all around the while,
With its proud boast might vie?
A shadow's shade,
A card-house made
By children for their play:
The air-blown bells
That folly swells
May vaunt a surer stay.

A few short years—and then
Where is the mighty grief
That wrung the heart with torture's art,
And made it feel that its relief
Time's hand could ne'er impart?
A storm that's burst,
And done its worst,
Then left the heaven more clear;
A night-mare dread,
With morning fled,
These sorrows now appear.

A few short years—and then
What of our life remains,
The smiles and tears of other years,
Of passion's joys, of sorrow's pains,
Ambition's hopes and fears?
A faded dream
To-day they seem
Which memory scarce can trace—
But seals they've set
Shall Time nor yet
Eternity efface!

REPULSION.

THERE are some popular maxims which have passed current for ages, perhaps from the beginning of all reflection among mankind, which nevertheless may, we think, be shown to involve some dilemma or absurdity materially subtracting from their value.

It is, for example, held as of great consequence that we avoid low and wicked company. Every parent tells his child to do so. Being seen in such company is generally regarded as sufficient to stamp any one's character. Now it may be, and no doubt is, quite true that most persons contract the character of the company they keep, and therefore *noscitur a sociis* is a justifiable rule. We should be the last to dispute the wisdom of a parent in counselling his son to avoid the society of mean or depraved characters. But what strikes us is, that just in as far as it is good for the good to keep away from the bad, so is it bad for the bad, because, associating only with themselves, they have no means of reformation or improvement near them. By the action of this rule, while there is a freedom from corruption on the one hand, there is an absence of correction on the other. So left, the rude can acquire no better manners; the wicked no better dispositions. They must each form a festering mass devoid of every healthy element.

Has it never occurred to any one to consider what is involved in the phrase—He has acted in this manner, and he must be put out of society? It is a punishment: we shall say a deserved one. Society can perhaps inflict no other. But what is to be the result? Deprived of the approbation and communion of his fellows, the delinquent is clearly doomed to become something worse. We do not, by merely ignoring his existence, negative him. He must appear, and appear, over and over again before us, and probably every time in a more malign aspect than before. It is not, then, a plan purely good for the public, however difficult it may be to devise any better. We are accustomed to hear that a father, being indignant at the misconduct of a daughter, turns her out of doors. The act excites little remark. To most people it seems right. But what is involved in it by way of consequences? No one can doubt that the victim, unless redeemed by some extraordinary accident, is destined to tenfold degradation, and a depth of guilt compared with which the first offence was a mere trifle. Considered with regard to consequences, there would appear to be something wrong in the father's act, though it may be scarcely possible to point out what it were better for him to do, seeing that he has his own honour, and that of the as yet innocent members of his family, to protect.

Manners form a comparatively trifling consideration; yet they are a question not beneath the philosophic ob-

server of society. What chance have the humble of improving their tastes, if their superiors do all they can to obtain habitations in another quarter, frequent their own exclusive places of amusement, meet only with each other, and only know of inferior grades by report? The system of exclusiveness, from its obvious consequences, is generally condemned; but few have the candour to see or to admit the difficulty involved in the case. The fact is, as every refined person has felt, it is a positive pain to associate with persons of inferior tastes and a lower tone of manners. It seems as vain to expect that one shade of refinement will consent to blend on easy terms with another, as that any honourable man will willingly associate with one of tainted reputation. The rude, therefore, appear destined to continue rude, as far as this means of diffusing better tastes is concerned.

Somewhat akin to the thrusting out of unworthy members from society is the discharging of servants and workmen for faults. The master assumes the right to dismiss any one whom he employs, if he has occasion to be displeased with him for any moral offence, however slight. We cannot, under existing arrangements, deny this right, or say how the matter could be otherwise. But does it ever occur, either to the master himself or to society, to consider what necessarily follows on the privilege being exercised? If A is found naught in some respect by B, and is on that account thrown out of employment, he may apply for work to C; but he will be no better to C than to B. If C is to employ him, he might have as well remained with B. If C rejects him, he is as likely to be rejected by D, by E, and so on. In short, he is thrown entirely out of the way of making his bread by honest labour. There is, therefore, *this* at the bottom of it: B, in his right of discharging for a fault (seeing that others are not to be expected to put up with what he rejects), is possessed of a right to extrude men from the trade or art by which they obtain an independent subsistence. Every time he exercises the privilege, he is putting a man in the way of becoming a Pariah or a pauper. He will choose to hold by the right; but in that case he should not be surprised that there are 'dangerous classes,' or that poor-rates are leviable.

It is a necessary, though a startling consequence of these speculations, that the extremely good people are partly a cause of there being extremely bad people. They do not mean it, but they cannot help it. The seeming paradox is easily explained. In a society where a particular vice is generally prevalent, and no great or influential class is clear of it, that vice will have no very bad repute. A guilty individual will neither be persecuted nor thrust out. Maintaining his place in the world, and some share of the good opinion of his fellow-creatures, he will have no occasion to sink into extreme degradation. The very opposite is the case of

the person who sins amidst an excessively virtuous society. He goes down into the depths at once, past all redemption. We see an illustration of this rule in the state of degraded women in England as compared with the continent. It is a complete dilemma. Virtue cannot soften her frown, and her frown produces effects by which she must be still more shocked.

It is these things which make civilisation so strange a problem. Jails, poor-houses, legions of outcasts, are as invariably its exponents as are lofty probity, vast wealth, consummate luxury, and grandeur. In a middle state of society there is, on the contrary, neither great wealth nor great poverty, neither great virtue nor great vice. Jails are moderate-sized buildings; poor-houses exist not at all. We smile at the story of the man shipwrecked upon an unknown coast, who, walking into the land with some fear, at length came to a gibbet with a culprit depending from it, and then congratulated himself upon being in a civilised country. But the subject has its side of serious truth as well as its ludicrous aspect. The object was quite sufficient to show that crime was here held in detestation, and duly punished. It would have come to the same thing if the stranger had lighted on a huge poor-house, or been let down from a balloon into the midst of a St Giles, or a Cowgate, or one of the Glasgow wynds. He might have argued in that case, 'I see that this is not only a civilised country, but a country where there is plenty of wealth for the winning. These wretched people are they whom wealth finds unsuitable for its works, and whom exquisite virtue repudiates. An excellent country for me!'

What can we say of it all? It is a system extremely favourable to clever people and good people—to those, in general, who have well-regulated minds—but deadly to all others. Continually from such a society there must be a shedding off of the inferior natures, down, and down, and down, to gnaw for a while at the feet of the prosperous and the worthy, but by and by to sink under some of the malignant physical influences to which they are exposed, and thus cease to be a trouble or a burthen. In a less advanced state of things, these people would have passed off tolerably among the rest, and lived all their days. In the mysterious arrangements of Providence, good has been their evil. Wealth has doomed them to poverty—virtue has plunged them deeper into vice. Their very harshness of manners is partly owing to there being nice gentlemen ready to die of a rose in aromatic pain. Such being the case, can there be a doubt of its being only more decidedly imposed upon us as a duty, to contend with every opposing influence, our own feelings included, in endeavouring to raise up, succour, and, as far as possible, improve and redeem, those who, from the less suitable constitution of their natures, are to be ranked as the victims of society?

THE DARK CHAMBER.

Nor very long ago there dwelt at Brookdale, a sunny spot of Warwickshire, one of the prettiest, merriest maidens, Phoebe Morris by name, that ever danced upon a green sward, or broke the susceptible hearts of a quiet pastoral and agricultural village. The neatest, smartest, handiest dairymaid in the county, she nevertheless created at times such dire confusion, heartburnings, and jealousies amongst the somewhat numerous operatives on the farm, that Farmer Gadsby would frequently threaten to discharge her if she did not leave off playing the mischief with his young men. To all which good-humoured oburgation Phoebe would demurely reply, 'That it was no fault of hers: goodness knows, she gave the "jackanapes" no encouragement, and should be heartily glad to be rid of the whole pack of them!' Honest Farmer Gadsby, a man of peace, though wearing buttons, seldom pursued the colloquy much further; consoling himself as he walked off with a quiet reflection that had been framed and glazed in his family for

several generations, to the effect—I am not able to quote the precise words—'That a maiden is a riddle, the true solution of which is seldom discovered till after marriage.' Phoebe, moreover, from being an orphan, 'who had seen better days'—that indefeasible claim to forbearance and consideration with all unsophisticated people—was a privileged person both with the farmer and his dame; and it was therefore with no little satisfaction, both as regarded the peace of the farmstead, and the comfortable settlement in life of the light-hearted, well-meaning, though somewhat skittish maiden, that the worthy couple observed after a time symptoms of a serious intimacy growing up between her and William Bayfield, the steady, thriving master wheelwright of Brookdale. Young Bayfield was quite a catch, as regarded circumstances, for a dairymaid, however smart and well-featured; and innumerable—in a village sense—were the exclamations of contempt and wonder indulged in by maids and matrons of the small-farmer and shopkeeper class at the *mésalliance* of a prosperous tradesman with a mere milkmaid. Little recked, however, it soon became manifest, the object of these ill-natured strictures of the displeasure of his critics; and so spirited and successful was the wooing, that the banns between William Bayfield, bachelor, and Phoebe Morris, spinster, were published within one little month of the day which witnessed the first appearance of the enamoured wheelwright in the list of Phoebe's miscellaneous admirers: converting into certainty the apprehensions suggested, by the arrival at William Bayfield's dwelling, the very day before, of an eight-day clock, a mahogany chest of drawers, a gilt pier glass, and a carpet—positively a Brussels carpet! The spinsterhood of Brookdale had no patience—how could they have?—with such airs, and indignantly wished it might last, that was all!

Alas, it soon became extremely doubtful whether the modest housekeeping so sharply criticised would ever commence! The rustic incense so long and profusely offered to the pretty Phoebe had not, it may be easily imagined, tended to diminish the stock of vanity with which the merry maiden was naturally endowed. She was unfortunately far too fond of exhibiting the power which she possessed, or fancied she did, over her humble admirers. The true affection which she felt towards her affianced husband did not suffice to shield him from her coquettish, irritating arts; and just three days previous to the expected wedding, a violent quarrel between the lovers, threatening to end in a total rupture of the proposed alliance, had taken place. The cause of quarrel will be best understood by the dialogue which took place between them on the following afternoon. Bayfield, who had not slept a wink all night, nor been able to settle himself to anything during the morning, had sent a message through kind Dame Gadsby, that he wished to speak to Phoebe, and was waiting for her by the chestnut-trees. Phoebe had herself been in trouble all day, fearing she had carried matters too far; but this message at once reassured her, and she determined, foolish wench, to make no concession whatever to the wounded pride and self-esteem of her lover.

'Well, Mr Bayfield,' said she, approaching him after a purposely protracted delay, 'what have you to say to me? I understood you had resolved never to speak to me again!'

'Well, Phoebe, I *did* say so, and meant it too at the time; but you well knew I was too much in love to be able to keep my word.' Phoebe laughed. 'Come now, let us be friends again: there's a good girl.'

'Oh, I daresay; and so give you leave to show off your jealous airs again with impunity? No indeed!'

'Nay, Phoebe, it was partly, at all events, your own fault. You tried me sadly: but come, let bygones be bygones. As to young Gaythorpe, of course he thinks nothing of you; so that—'

'Don't be too sure of that, Mr Bayfield,' interrupted Phoebe, tossing her head, and pouting her pretty lip. 'Edward Gaythorpe has eyes in his head, I suppose, as well as other folk.'

'I daresay he has,' replied Bayfield, his jealousy reawakening; 'and if you prefer him to me, even so let it be: I'll not stand in his way.'

Phoebe angrily retorted, and the result was a more vehement quarrel than before; and they at last separated, both avowing a fixed determination never to see or think of each other again. After striding nearly to the end of the long lane in which they had been standing, William Bayfield turned round, half-repentingly, just at the moment, as ill fortune would have it, that Edward Gaythorpe, who had been observing the pair from the covert of the chestnut-trees, joined his mistress, and officiously walked by her side as she proceeded home-wards. Her soft eyes were suffused with tears, and she replied only by curt monosyllables to the soothing blandishments of the young farmer. Of this poor Bayfield was necessarily unaware: he saw only the ill-timed, suspicious *rencontre*, and, his heart overflowing with rage and grief, strode fiercely away towards the village. Instead of proceeding to his own dwelling, he entered (a most unusual thing for him to do, especially in the day-time) the principal tavern of the place, and seating himself in the parlour, called hastily for brandy and water.

It unfortunately happened that Sergeant Crump, a zealous recruiting officer in the service of the Honourable East India Company, and indefatigable trumpeter of the manifold virtues, civil and military, of that distinguished corporation, was, at the moment of Bayfield's entrance, haranguing the two or three persons present upon the brilliant advantages proffered by his lavishly-generous employers to all heroic spirits desirous of obtaining fame and fortune, glory and prize-money, where alone those desirable articles *could*, in the present stagnant state of the world, be with certainty attained—namely, in the delightful dazzling East! The magniloquent oratory of the sergeant, hot and glowing as it was, altogether failed of kindling the cold clods he so pathetically addressed; and he would probably have soon ceased his funning in despair, had not his practised eye discerned in the countenance of the new-comer indications of a state of mind extremely favourable to a proper appreciation of recruiting eloquence. He consequently persevered, and by the time William Bayfield had poured the third tumbler of brandy and water down his throat—he could hardly be said to *drink* the liquor—had the satisfaction of perceiving that he was listened to with a sort of moody desperation and half-scornful approval. More liquor was called for; and finally Bayfield, maddened by potations to which he was unaccustomed, acting upon his previously exasperated state of mind, accepted with reckless idiocy the Company's shilling, and was at once enrolled in the sergeant's memorandum book as a full private in one of the East India Company's cavalry regiments! As it was quite out of the question that a man in the position of William Bayfield would, whatever his present frenzy might prompt, think seriously of enlisting, a night's rest, and two or three pounds by way of 'smart money,' would probably have terminated the affair, when, just as the orgie was at its highest, Edward Gaythorpe entered the room. It required but this to raise the excitement of the new recruit to downright madness. Furious taunts and menaces were quickly exchanged: Bayfield sprang wildly up, seizing at the same time, and drawing, the sergeant's sheathed sword, which lay on the table: Gaythorpe caught hold of the poker, and a desperate struggle ensued. Bayfield received a heavy blow on his left shoulder, and at the same instant thrust the sword through the body of his antagonist. The outcries of the sergeant—the company had departed some time before—quickly brought the landlord and two or three others into the room: Bayfield was first, with much difficulty, secured; and then Gaythorpe was conveyed to bed, and a surgeon sent for. William Bayfield, thoroughly sobered by the tragic issue of the fray, was, a few hours afterwards, escorted by the entire constabulary of the place to the

nearest borough town, about six miles distant, and there securely lodged in jail.

Such a catastrophe had not occurred in quiet pastoral Brookdale within the memory of the oldest inhabitant; and dire was the tumult and the tossing to and fro of the bewildered mind of that small public. Phoebe Morris was in despair; her silly, coquettish behaviour had, she felt—though few others suspected it—occasioned all the mischief: and fervent were her vows of future amendment should this peril pass away. After a day or two, the excitement of the good folks began to gradually calm down. Young Gaythorpe's wound was found to be merely a flesh one, the sword having barely grazed his ribs, and consequently not at all dangerous. He was a good-natured young man; and though somewhat smitten with Phoebe's pretty face, was not at all disposed, upon calm reflection, to avenge his fanciful disappointment upon his rival. His father, too, a rather wealthy yeoman, having, reasonably enough, much higher views for his son, was very anxious that nothing should occur to prevent Phoebe's union with Bayfield. No wonder, therefore, that under these circumstances a rumour speedily gained ground that the Gaythorpes did not mean to prosecute; and that, moreover, the wounded man had no distinct recollection as to who began the fight—whether he first assailed Bayfield with the poker, or Bayfield him with the sword. It seemed, therefore, more than probable that the at one time ugly-looking affair would end after all in mere smoke.

There was apparently but one obstacle to this much-desired consummation; but that was a formidable one. The sergeant, who, in the struggle to disarm Bayfield, had received a slight cut on the cheek, which, in the owner's opinion, somewhat marred its martial comeliness, persisted that the prisoner had committed an entirely unprovoked and intently deadly assault upon Edward Gaythorpe, whom he had, moreover, repeatedly menaced with the direst vengeance previous to his entering the room. This evidence, it was felt, would entirely change the complexion of the case, and have the effect, if deposed before a magistrate, of consigning the unhappy wheelwright to prison, there to await his trial on something very like a capital charge at the next assizes.

The hearing of the charge had been adjourned from the following Thursday, to which day Bayfield had been first remanded, till Saturday at ten o'clock, in order to compel the attendance of Edward Gaythorpe, who had declined to obey the mere summons of the magistrate. On the Friday evening, disconsolate Phoebe Morris arrived at the Falcon Inn, an old-fashioned, straggling hostelry, in which the obdurate sergeant, accompanied by a newly-entrapped recruit, had taken up quarters for that night only, in order to be present in time at the next morning's investigation. Phoebe's purpose was to essay what effect 'beauty in tears' might have upon his iron nature. Vainly, however, did beauty, not only in tears, but pretty nearly in fits, plead to the recruiting rhinoceros: he was inexorable. 'He had,' he said, 'one duty to perform towards society, which had been outraged; and another,' glancing grimly at his plastered cheek reflected in the glass over the mantelpiece, 'towards himself, who had been injured; and those two duties he was determined to fulfil.' Phoebe was at her wits' end; and but for some very strong consolation whispered in her ear by the chambermaid of the Falcon, who had assisted at the conference, and felt greatly irritated at the sergeant's flintiness, would probably have gone off into permanent hysterics. As it was, she contented herself with one or two reproachful sobs, and indignantly withdrew from the presence of a monster whom smiles could not soften nor the tenderness of tears subdue. 'A perfect brute!' said the chambermaid, as soon as she was out of the sergeant's hearing: 'but never mind, Miss Phoebe, there's more ways to kill a mad dog besides hanging the creetchur!' With which enigmatical illustration Mar-

garet Davies—so was the angry lady named—dismissed the subject; and Phoebe found herself shortly afterwards jogging sorrowfully, yet hopefully, homewards in Farmer Gadsby's taxed cart, much musing on the possible events of the morrow. Margaret Davies, I should mention, had nursed Miss Phoebe, as she persisted in calling her, in those 'better days' to which I have alluded, and thence doubtless arose her sympathy with the afflicted fair one.

The sergeant had walked a long distance that day, and feeling more than ordinarily tired, regretted, as he undressed himself in the double-bedded room he had bespoken for himself and his recruit, that he had not desired Boots to call him. 'Never mind,' thought he, 'I shall be sure to wake by ten o'clock, and that will be quite early enough.' So thinking, he tumbled into bed, and slept without rocking.

The next morning William Bayfield was brought before a bench of magistrates, and Mr Gaythorpe, junior, being in attendance, the charge against him was proceeded with; and it was soon apparent that if no other evidence than that of the unwilling prosecutor could be obtained, nothing but a common assault, arising out of chance medley, would be substantiated. The name of Mr Crump was bawled out with immense emphasis, both inside and outside the hall of justice, by the bustling town-sergeant; but much to the astonishment of those familiar with the precise habits and punctilious attention to orders of that rigid soldier, no Crump answered to the summons. The zealous functionary was directed to proceed to the Falcon in quest of the missing witness; and after about a quarter of an hour's absence, he returned with the tidings that 'No. 24, Sergeant Crump and another,' had left the Falcon at daybreak, and had not been since seen or heard of. This intelligence the town-sergeant had received from the respectable landlady's own lips. The attorney employed to defend Bayfield urged an immediate adjudication upon the evidence already heard as a matter of right; but the magistrates finally determined upon waiting for Crump till four o'clock in the afternoon, the usual hour for closing the office; when, if no additional evidence appeared, they would decide the case.

Poor Phoebe's heart sank within her. Still her friend the chambermaid had spoken so confidently of 'all day,' that after a minute or two she rallied amazingly, and bestowed such a shower of gracious and encouraging smiles upon the penitent prisoner, as would, if, as those story-telling poets tell us, imagination possessed wings, have raised him from the dock up to the seventh heaven. As it was, his mortal part—whatever flights the ethereal essence indulged in—remained in durance vile, tremblingly apprehensive of the arrival of Crump.

And where was that dexterous snapper-up of youthful heroism all this anxious while? Alas! himself could scarcely have answered the question.

Sergeant Crump, as I have before mentioned, feeling unusually fatigued, was soon in a state of the profoundest slumber. Not less intense was the drowsiness of the jolter-headed recruit, who snored in the adjoining truckle-bed, and whose natural heavy-headedness had been considerably increased by copious draughts of malt liquor. Long and sweetly did they slumber; till at last the sergeant, after a few preliminary twists and turns, started hastily up in his bed, impressed with a strong conviction that he had sadly overslept himself, and forthwith began rubbing his eyes. This he did partly from habit, and partly to rub out the darkness which still—fully awake as he deemed himself—seemed strangely to encase them. 'Very odd,' growled Sergeant Crump: 'it is dark! Well, if I couldn't have sworn I had slept twelve hours at least!' Sergeant Crump was quite right; it was dark, one of the darkest nights, especially for summer-time of year, as it then was, either he or any other gentleman had perhaps ever experienced. Mr Crump tried to remember if there was a moon, or at what time that luminary went down, or rose up, but could not for the life of him de-

termine: his last and present night's experience suggesting such totally different conclusions. 'I cannot have been in bed anything like the time I supposed,' he soliloquised. 'It must be so; but it's very odd.' Diggins, the recruit, was snoring away as vigorously as if he had only just begun the exercise; and the sergeant, convinced at last that, contrary to his usual habit, he had awoke before his time, again addressed himself to sleep. By dint of perseverance he managed to doze off again, and had remained in a state of semi-somnolency for perhaps three or four hours, when he again bolted upright in his bed, thoroughly wide awake and thoroughly bewildered! It was still as dark as before; and a horrible surmise crossed Mr Crump's mind, that possibly the mechanism of the universe had somehow got out of order, and that the sun might consequently never again rise upon a benighted world!

The fact was, No. 24, 'Soldiers' Rooms,' to which, wilfully misunderstanding the landlady's directions, the sympathising chambermaid had directed the under-bedmaker to convey the sergeant and his man, was an inner apartment in a distant part of the rambling old inn, the windows of which, as well as those of the rooms surrounding it, had been closed up, to mitigate the pressure of the window-tax, and was of course nothing more than a large roomy dark closet, to which even air obtained access only through the chimney. The sole window left was at the top of a wooden partition dividing the sergeant's room from the next, and had in its time done duty as a 'borrowed light,' but inasmuch as the adjoining rooms were also hermetically sealed from the glare of day, was now at best but a borrowed 'darkness.' These rooms were usually reserved for soldiers of marching regiments occasionally billeted on the Falcon; a compelled entertainment, by the way, which is seldom of a very superior character. The reader will now be able to comprehend the cause both of Phoebe Morris's nervous anxiety and of the sergeant's perplexity.

He was indeed perplexed in the extreme. At last, jumping angrily out of bed, he groped his way, after several mishaps in which both feet and shins suffered abominably, to the door, the key of which he remembered to have left in the lock. In his haste to find and grasp it, he struck it unawares, and out it flew from its shallow, ill-fitting receptacle to the floor; and all Mr Crump's efforts to find it were unavailing. Had he been able to open the door, he would not have been much the better of it, as it merely led into another dark room, the outer key of which, for fear of accidents, provident Margaret Davies had taken care to secure. The sergeant next bethought him of the window: there must be, he argued, a window; and by means of a tentative process round the walls with his cane, he at last managed to discover its whereabouts. The outside shutter was, he conjectured, closed; but how to reach it? Rousing the recruit, who by this time had pretty well slept off the effect of his previous evening's potations, he proposed to mount upon that worthy's shoulders. This was agreed to, and with some difficulty accomplished; but the sergeant, even on that ticklish eminence, could scarcely reach above the bottom of the narrow casement; and the fastenings were, he concluded, considerably higher up. In order to obtain the necessary altitude, Diggins drew his truckle-bedstead—a narrow fold-up affair, steady enough when a person was lying on it, but miserably unfit as a base for a man to stand upon, especially with another mounted on his shoulders—close to the wall; and after several unsuccessful efforts, the sergeant at last stood once more upon Diggins's shoulders, and was enabled to grope gingerly over the surface of the casement in search of shutter bolts, of course without success. In his wrathful energy, Crump, for a moment oblivious of the precarious nature of the base upon which he was operating, pushed angrily at the window-frame, and at once over-set the equilibrium which Diggins had till that moment with so much difficulty maintained. The folding bed-

stead heeled suddenly over; Diggins caught instinctively at the sergeant's legs; and the sergeant, in his turn, made a desperate snatch at the casement, sending in the effort his hand clean through one of the squares, clearly but painfully demonstrating, to himself at least, the absence of shutters; and then down came Crump and Diggins with stunning violence, and mutual execrations and discomfiture. Bruised, bleeding, and incredibly savage, the sergeant, having first helped to replace the bedstead of his equally savage companion, once more resigned himself to his pillow, persuaded, in his own despite, that it could not yet be day. Hour after hour they lay watching for the dawn, the faintest streak of which would have been unspeakably welcome. At last, his patience utterly exhausted, Crump sprang up, and kicked and bawled for help with all the power of his feet and lungs, in which exercise he was zealously aided by Diggins, whose appetite had by this time become ravenously sharp. Long and fruitlessly had they raved and thumped, and were just on the point of abandoning their efforts in despair, when a step was heard evidently approaching their dormitory. Presently a light shone through the crevices of the door, and the voice of the chambermaid, Mrs Margaret Davies, was heard generously demanding who it was making that disturbance at nearly ten o'clock at night, when quiet folk were just going to bed? 'Going to bed!' Crump huddled on his clothes; and having, by the aid of the light, espied the key, opened the door with a bounce. 'Going to bed!' he shouted distractedly as he glared upon the chambermaid—'going to bed!' No sooner did that amiable damsel catch sight of the haggard features and bloodstained hands and linen of the sergeant, than she plumped down in a chair, and set up a succession of the dimmest shrieks that ever disturbed and dismayed a Christian household. 'Murder—fire—thieves—robbers!' resounded through the house with an effect so startling, that in a trice hostlers, porters, waiters, with a plentiful sprinkling of female helps, came rushing hurriedly to the rescue. Nobody either could or would recognise the culprits, spite of their energetic asseverations, till the arrival of the pursy, slow-moving landlady. The screams, which had gradually diminished in intensity, then altogether ceased; and in echo, as it were, of the ejaculation of her mistress, 'Sergeant Crump and the recruit, as I'm alive!' Mrs Margaret Davies naively exclaimed; 'Mercy upon us! Sergeant Crump! Why, so it is! Then you did *not* go away this morning without paying your last night's score?'

The sergeant, who dimly suspected the jade's trick which had been put upon him, only glared frightfully at her, and hastened his toilet.

'Margaret, I thought I told you to put Mr Crump into No. 24?'

'Certainly, ma'am, you did; and I told Susy the same; but it appears she must have understood it to be No. 24 "Soldiers' Rooms." Dear me, whoever would have thought it? And, bless me, what a dreadful situation for two gentlemen in her gracious Majesty's service to have been in so long! It's quite shocking to think of really!'

The suppressed tittering of the other servants—all of them, I suspect, more or less in the secret—here burst into uproarious merriment: the sergeant, almost choking with fury, looked round for some safe object to vent it upon, but finding none, wisely kept it corked for future use.

'And to think, ma'am,' continued Phoebe's friend, 'that in consequence of this *uncommissioned* officer's long nap, that scapegrace of a Bayfield should have got off this afternoon with only a trumpety fine of five pounds; not more than half the amount of the *recollections* which the sergeant has forfeited for not being at the hall to give evidence.'

'What is that you say, — *woman*?' exclaimed Crump, using the most vituperative epithet he could at the moment think of.

'Why, I say,' meekly replied Margaret, 'that your ten-pound *recollections*, which you gave the magistrates to appear, is declared forfeited; and that the town-sergeant is below with a warrant for the amount in case you should return to the Falcon this evening.'

The exasperation of the sergeant was unbounded. The landlady, thinking probably that mischief might come of it, drove off his tormentors; and he was left to finish his ablutions in peace.

'Oh, Sergeant Crump!' exclaimed Mrs Margaret Davies, returning at the end of two or three minutes, and holding the door ajar in her hand, 'if you please, missus wishes to know if you mean to bespeak a bed for to-night?'

Crump darted towards the door; but the playful damsel was too nimble for him, and the long corridors and staircases echoed again with her joyous merriment as she skipped away.

The account given by the chambermaid of the result of the inquiry before the magistrates was quite correct. William Bayfield was fined five pounds, or, in default, to suffer two months' imprisonment for a common assault, *without intent, &c.* The fine was at once paid, and the certificate of adjudication of course barred any further proceedings. On the next bench-day, Crump having related, amidst shouts of laughter, the trick he had been played, asked to be excused payment of his forfeited recognisance. This, under the circumstances, was, after some demur, agreed to; but he was unable to obtain even 'smart money' from Bayfield, he having been, upon the sergeant's own admission, inebriated when he accepted the Company's retainer.

The imminent peril in which her criminal coquetry had involved her affianced husband proved a salutary lesson to Phoebe, who has settled down into one of the discreetest, as well as prettiest and cheerfulest, wives in Warwickshire. Bayfield is now a prosperous man; and has recently purchased, at his wife's suggestion, the Falcon Inn, which the sudden death of the fat landlady had thrown into the market, chiefly for the purpose of assuring the succession of the business to Margaret Davies, to whose good offices he was on a very critical occasion so largely indebted. Sergeant Crump, disgusted with England, which in his indiscriminate wrath he rashly confounded with its chambermaids, betook himself with all convenient despatch to the gorgeous clime whose glories he had so frequently described; and if report speaks sooth, has discovered a still darker chamber than that of the Falcon beneath the towers of fallen Moulton.

CURIOSITIES OF GLASS-MAKING.

THE history of useful art is always interesting, not only on account of its obvious applications, but because, when examined into, we find it envelops many details which justly come under the designation of curiosities. There is doubtless no trade, however humble, that could not furnish a notable collection of facts; our own pages contain ample evidence on this point. We have now before us a work which promises well for a further contribution.* The author is already known by a treatise on the manufacture of glass, published some years since, and for lectures on the same subject delivered at the Royal Institution in London. In the present volume we have amplified details on most parts of the interesting process whereby opaque materials are converted into a perfectly transparent substance.

Without going minutely into the manufacturing operations, we may give a brief notice of them for the better understanding of what is to follow. The materials of crown-glass are—of sand, 5 measures; of ground chalk, 2; carbonate and sulphate of soda, of each 1. The sand now used, in preference to the former practice

* *Curiosities of Glass-making: with Details of the Processes and Productions of Ancient and Modern Ornamental Glass Manufacture.* By Apsley Pellatt. London: D. Bogue. 1849.

of grinding flints, is obtained from Reigate, Lynn, and the Isle of Wight. When mixed together ready for melting, the compound is technically known as 'batch;' and when melted, as 'metal.' Greater opacity or brightness and differences of colour are obtained by variations and additions of oxides, alkalies, and metals before the batch is transferred to the melting-pots. The making of these pots is a material part of the process; unless constructed of the best kind of fire-clay, they will neither bear the intense heat of the furnace, nor the pressure of the eighteen hundredweight of molten glass which they severally contain: a large pot will cost L.10. The pots are dome-shaped, with a lateral aperture; there are ten of them to a furnace, each one placed opposite an opening in the wall, through which the workman takes out the melted material, which requires from fifty to sixty hours of the intensest heat before it is fit for working. As fast as the articles are made they are conveyed away to the annealing oven; on leaving which after the cooling process, which lasts from six to sixty hours, they are in most instances ready for sale. Before the repeal of the late vexatious Excise laws on glass, manufacturers were exposed to a most irritating and injurious supervision: the wonder is, that they ever submitted to it.

The tools used in glass-making are very few; two kinds of nippers (*pucellas*),* a pair of shears, an iron tube and rod (*pontil*), and a battledore-shaped instrument. More depends on the tact and dexterity of the workman than on anything else; he must have a quick eye and ready invention, as he has to deal with an article which rapidly loses its pliant qualities, and becomes intractable, and which is imperfect in appearance the more it is touched with tools. To describe the making of a wine-glass would convey a tolerable idea of the facts and circumstances. First, a ball of 'metal' is gathered at the end of the blowing-tube, the workman blows it slightly, and rolls it, without separating it from the tube, rapidly backwards and forwards on an iron table (*marver*), which gives it an elongated oval form. The free end is flattened by a touch of the battledore, and receives a small lump of hot glass, out of which the stem is shaped with the nippers, while the workman rotates the article rapidly by means of the tube laid across the arms of his chair. Presently the stem is finished, a small globe of metal is attached to its outer end, and by dint of further rotating and compression, is formed into the base or foot of the glass. The blowing-tube is then detached; the lower side of the foot is affixed temporarily to the pontil by which the article is presented to the furnace hole to be rewarmed and softened, and while in this state, the edge or rim of the cup of the glass is clipped round with the shears, and the article receives a final twist or 'flash' from the hands of the workman, which produces the required form. The making of a number of wine-glasses perfectly alike in all respects, and free from tool-marks, involves a high degree of skill and dexterity on the part of the manipulator.

Glasses of a gradually-tapering form, and ale-glasses, are made of two pieces only: the simplest of all articles in the manufacture is a tumbler, but it needs a good quality of metal. The ribs seen on light, cheap tumblers are marks made by the rolling on the marver in the first stage of their blowing. These are not taken out, as is the case with better goods, neither are the edges clipped.

Chemical retorts require peculiar manipulation to keep the neck from collapsing at the bend. They are blown and swung about at the end of the blowing-tube, until the lengthened gourd-like form is nearly produced; and then, while yet soft, are made to bend over a bar by their own weight, which gives the neck a direction at an angle with the bulb. The blowing of

large lamp-shades of graceful outline and lily-like chimney is also a nice process. The *modus operandi*, it must be remembered, is generally the same as that described for the wine-glass; and to one uninitiated, the apparent ease with which the accuracy of form is obtained becomes perfectly marvellous. The rounded projecting ribs, called moulded Roman pillars, which impart so elegant an appearance to glass vases, are produced by pressure. The metal collected at the end of the tube is pressed into a mould; and the workman, by blowing into it, forces the molten glass into the hollows of the mould; while, by a precaution, the interior surface remains smooth and even. The invention of this process was supposed to be altogether new; but late researches prove it to have been known to the Romans.

As Mr Pellatt observes—'The ductility of flint-glass is strikingly exhibited in the process of cane or tube-drawing, which is extremely simple, and depends so much upon tact and adroitness, that it is a matter of surprise how an approximation to uniformity of size and bore can be attained. A solid ball being gathered on the end of the blower's iron, if for hollow tube, is expanded by blowing; but if for cane, blowing is not requisite: when partially cooled, it forms a nucleus for one or more other gatherings, until the requisite quantity be obtained. Where flat bore tube is required for thermometers, the first ball is flattened by an iron or wood battledore on the marver prior to the subsequent gatherings; this insures a flat bore, although the exterior of the tube is round. The ball is then elongated by swinging, and the farther end of it is chilled by dipping it into cold water. A workman, then, having prepared a disk of hot glass, called a "post," places it vertically as near the ground as possible, to receive the ball from the chief workman, who ascends his chair, or an elevation, so that the hot glass may by its gravity be dropped upon the post below, to which it adheres by partial welding. The chief workman then descends, and the drawing begins—each workman constantly receding from the other: at first the suspended glass between the two rods assumes (at a red heat) the form of a parabola; but as the tension proceeds, the workmen are continually rotating. Some parts are cooled by fanning with the hat of an attendant boy, to insure uniform elongation, till the cane or tube is drawn to a length sometimes of from sixty to seventy feet: as the metal cools, the tube ceases to rotate, and it assumes, by continued tension, nearly a straight line: except at the extreme ends, it is nearly of one uniform bore, diameter, and substance; and whatever may be the diameter of the tube, the bore and substance will always bear an exact relative ratio to each other. Lastly, it is deposited on the wood round of a ladder, and requisite lengths are whetted off by the cold iron, or by a steel file.' In the mode above described, the forty-foot tube for the Royal Society's water barometer was made: it is erected in the hall of the society at Somerset House, and is, we believe, the only instrument of the kind in Europe.

Canes of various colours, when thus drawn, are used in the production of what is called 'filigree glass;' a branch of manufacture in which the Venetians excelled, and which of late years has been successfully prosecuted in Bohemia and France. In making a vase of this sort, different coloured canes of the required length are selected, and placed upright round the inner surface of a mould resembling a flower-pot. A lump of metal gathered on the end of the rod is then pressed into the mould, and the heat is such that the surrounding canes adhere firmly to it. This, when reheated, may be drawn out into any form with longitudinal coloured stripes. These stripes may be made to assume a spiral direction by holding an end of the article firmly with one hand, while the other gives a twist to the right or left. With a slight change in the preliminary process, hollow articles, vases and goblets, may be obtained; and many pleasing effects brought out by apparently simple means. The '*vitro di trino*,' as it is termed,

* It is curious to note the adoption and transformation of foreign names for implements: the *pucellas* and *pontil* of the British workman are the *procello* and *punto* of the Venetian.

affords a remarkable instance. A vase of this make presents a brilliant diamond or lozenge-shaped surface, internally and externally; produced by fitting a case or cup whose canes are twisted to the right into another whose twist is to the left. 'These two conical cases now crossing each other are, by rewarming, collapsed together, entrapping between each white enamel crossed section uniform interior air-bubbles; and the two cases, now become one, may be formed into the bowl of a wine-glass or any other vessel.' It appears almost incredible that beautiful effects should be produced by such extremely simple means.

The Venetian ball is formed of a number of waste pieces of filigree packed inside a pocket of transparent glass, which, when softened, collapses upon the contents, and becomes one entire mass. 'Mille fiori,' or star-work, also of Venetian origin, is somewhat similar. A double hemisphere of white glass is prepared, forming but a single piece, yet with a space between the upper and lower cases. Through a small opening in the centre of the upper one numerous pieces of coloured glass, of different shapes and sizes, are introduced, and sometimes arranged in a regular pattern, or as a group of flowers. This is afterwards reheated; and the contained air being sucked out, the two walls come together, and fix the intervening deposit, and the whole mass may then be fashioned to any required shape. As tazzas and paper-weights, such articles may now be met with in the shops of glass-dealers and stationers; their appearance is very attractive, and no trouble is required to keep them clean. It will be easy to understand that by analogous processes cameos, inscriptions, antiquarian relics, &c. may be incrustated with glass, and thereby imperishably preserved. The first stone of the new Waterloo Barracks in the Tower, laid by the Duke of Wellington in 1845, was coated in this way. Such a preparation fully justifies the expression, 'more lasting than brass.'

The 'beautiful semi-opalescent, yellowish-green colour,' so much admired in scent-bottles, handles for doors, drawer-knobs, &c. is produced by the admixture of oxide of uranium and copper to the raw material before melting. The ever-alternating appearance—now yellow, then green—which it presents is caused by differences of reflection, according to variations in the thickness of the glass.

A frosted surface is obtained by suddenly dipping the heated ball at the end of the blowing-tube into cold water. The submersion, as the author explains, 'produces crystalline convex fractures, with a polished exterior, like Derbyshire spar; but the concave intervening fissures are caused, first by chilling, and then reheating at the furnace, and simultaneously expanding the reheated ball of glass by blowing; thus separating the crystals from each other, and leaving open fissures between, which is done preparatory to forming vases or ornaments. Although frosted glass appears covered with fractures, it is perfectly sonorous.'

Several results which the Venetians perfected by patient manipulation, are effected by our glass-workers by compression in moulds: among these is a lozenge or diamond surface. Formerly each angulated section was pinched into form while soft; now the whole vessel is diamonded at once. The drops and studs which glitter so beautifully on lamps and chandeliers are, however, produced singly, being pinched one at a time in a brass compressor contrived on the same principle as a bullet-mould.

Glass-engraving, as it is termed, is effected by an ingenious process: a die or cast, made of porous material, bearing the device, coat-of-arms, &c. in relief, is fitted into the side of a mould in which the engraved article is to be fashioned. On removing the latter, the die adheres to and is annealed with it; but being subsequently soaked in water, the die comes away, leaving a sharp, and distinct, and perfectly-finished intaglio.

There are other curiosities of glass-making which the work under consideration leaves altogether unnoticed,

or dismisses with an incidental allusion. Malleable glass, for instance, a new preparation of which has lately been discovered by Schöenbein. Strictly speaking, however, we can scarcely call it glass, seeing that it is composed of the pulp of common paper transformed by a process for which no more intelligible term has yet been found than *catalytic*. This substance is rendered waterproof; and being then perfectly transparent, is manufactured into window-panes, vases, bottles, &c. which bear a fall without breaking. Then there is the ribbed glass used for skylights and windows, which, though it admits light effectually, conceals the interior of an apartment from inquisitive eyes outside. Watch-glasses, too, which are blown in globes, and then cut out one by one, might have afforded another illustration of the adaptation of means to ends. The glass-works of Bohemia would furnish many additional examples: in most respects the manufactures of that country are unrivalled. Perhaps the beauty of form which so many of them exhibit is to be accounted for by the fact, that the Bohemian workman blows nearly every article inside a wooden mould, not trusting, as the English operator, to a practised eye and dexterous hand. It is to Bohemia that we are indebted for hyalite, a species of black glass as yet but little known, but which, owing to its quality of resisting boiling liquids, is coming into use for teapots, coffee-cups, &c. Mr Pellatt instances a glass vase by a Bohemian artist which rivals the famous Portland Vase. The subject, Le Brun's picture of the defeat of the Persians at Arbela, is most elaborate, and worked out with consummate skill.

Mr Layard, in his valuable work on Nineveh, has shown that the Assyrians were acquainted with glass. This fact will tend to diminish the surprise not unfrequently expressed as to the proofs of glass having been manufactured in Egypt prior to the exodus of the Israelites. Assyria gives us a higher antiquity than Egypt; whether we shall ever get farther back with curiosities of glass-making remains to be proved.

Many rare and interesting specimens of ancient glass are preserved in the British Museum, where they may be inspected by the curious. They prove what has been often advanced, that mental progress is wave-like, at times rising to a commanding elevation, and then descending to a deep subsidence. It is not more than three hundred years ago that the first glass-houses were erected in England; much has been achieved in the intervening period. In what constitutes really good glass our manufacturers are said to be pre-eminent; and now that invention and enterprise are freed from the Excise incubus, we look, ere long, for further curiosities of glass-making.

THE FESTIVAL OF THE PROPHET.

ONE of the most remarkable and characteristic sights to be seen in Cairo is the Festival of the Prophet, held in commemoration both of the birth and the death of Mohammed. It takes place in the beginning of the third month of the Muslem calendar, and moves gradually therefore all round our year. In 1847, it occurred in February during my winter's residence in the City of Victory; and though I had seen *zikrs*, or dervish prayers, performed before, I was much struck with the scenes that presented themselves throughout the Festival.

The place chosen for its celebration is the south-west corner of what may be called the Esbekiyeh Gardens—formerly a vast open space, alternately a lake and a morass, now drained, encircled by a moat and a splendid drive, and planted with all sorts of trees. On nearly every side rows of palaces, hotels, and other buildings overlook it. In the alleys are numerous coffee-sheds, frequented every evening principally by the Frank population, who exhibit their version of the Parisian fashions in sight of the place where Kleber fell by the hand of an assassin.

On the third night of the month the dervishes pitch their camp and commence their performances, which continue until the twelfth night. By day there is nothing remarkable to be witnessed save the antics of one or two buffoons, by whom the idle crowd is amused. A little old black woman seemed the most popular of these. She carried about with her a huge club wrapped up in many-coloured rags, with which she went through a variety of manœuvres, considered infinitely comic, if one might judge by the grins they excited, but not at all pleasing to a European eye. A very raw Englishman from Shepherd's Hotel, with whom I walked out one day, muttered something about the propriety of giving her in charge!

A little after sunset on the third or fourth night I went with a party to see what was to be seen. As soon as we entered the *Esbekiye* from the north, we heard a confused hum of human voices coming from the camp, and saw, flashing through and over the summits of the trees numerous clusters of bright lights. On reaching the western avenue, the first object that presented itself was the *kayim*, or row of four tall masts kept steady by numerous long ropes stretching from their summits to a great distance on both sides. These were covered with lamps disposed in ornamental order, each cluster being hung up by some pious person in honour of the Prophet, as in Roman Catholic countries tapers are burned in honour of saints. As we drew near, a burst of musical instruments to our right announced the approach of a body of dervishes from Boulac. They came hurrying with torches and strings of lamps hung upon poles through the city-gates, and proceeded to occupy their tent, not far distant from the *kayim*.

There were two long rows of tents, some very large, and all open to the public gaze, stretching on either side of the road. Some were very brilliantly adorned with wooden chandeliers; in others a circle of dervishes went through their devotions in the dim light of one or two oil lamps. The most attractive were at the southern extremity, near the mosque of Sheik Bakri. It is difficult to convey an impression of the feelings produced by a walk through this extraordinary camp. The very fact of the ceremonies being performed by night, is calculated to fill the mind with a kind of awe; not at all likely to be diminished by the knowledge that if fanaticism exists anywhere in Egypt, it must be concentrated upon that spot. The rows of black tents, the gleams of light here, the sombre shadows there, the streams of people moving to and fro, the heavy masses of foliage, the dim tapering minarets of neighbouring mosques, the drumming and shouting of distant *ashârahs*, or processions of dervishes, but, above all, the unearthly sounds proceeding from the performers themselves, all unite to stimulate curiosity and kindle the imagination.

Let us pause before one of the principal tents about the centre of the right-hand row. It is spacious, but sparingly lighted. A number of men in ordinary costume sit in a circle, whilst a respectable-looking individual stands in the centre. He begins to chant in a low measured tone the praises of God; and the dervishes having listened a few moments in silence, become acted upon at length by the commencement of an extraordinary excitement. In the first place, they turn their heads round and round very slowly, repeating the first syllable of the name of God as they look to the right, and the second syllable as they look to the left—'Al—lah!' By degrees, as the singer becomes more eager, they grow more impassioned, and soon every head rolls with frightful rapidity. At length all start to their feet; and, still repeating the name of God, turn from right to left, and left to right with increasing vehemence. Their faces show signs of great excitement, and even of delirium. Some of them drop off their turbans, and frantically

shake their shaven crowns, their eyes being half closed, their mouths foaming, every feature contracted. Occasionally a man fell down in a fit, but his place was immediately supplied; and on went this extraordinary prayer—the motion now having become a forward inclination, during which the word 'Allah' was pronounced at one jerk, as if it had been pumped up from the very bottom of the stomach. It is impossible to describe the extraordinary sound produced by thirty or forty men keeping exact time. I can only compare it to the growl of some enormous wild animal.

I had not patience to wait from the beginning to the end of a *zîkr*, as these performances are called; but I saw them during my walks in all their various stages. Towards the end, the ranks seemed often thinned, especially late at night; and the performers, pale, and running with perspiration, seemed scarcely able to prevent their knees from giving way, though still gasping out, however, in accents that had no resemblance to anything human, the name of God.

On one occasion I saw a woman come forward from among the crowd, and without seeming to attract any notice, stand behind the dervishes, and perform a grave and solemn dance. Occasionally she uttered a snatch of some song; not the same as that sung by the leader of the *zîkr*, but to the same air, and harmonising well with the scene. It may be worth while to mention, as my experience is opposed to the opinion of most travellers, that I have more than once seen women pray in Egypt, with all the formalities of prostration and genuflection. They seem to prefer doing so, when alone, on the banks of the Nile, on the seashore, or near some well. This accounts for their being seldom seen. A large class of Mohammedans consider that women have no business to pray.

The principal seat of the camp was at the southern extreme of the left-hand line. It was fitted up very handsomely with carpets and cushions, and brilliantly lighted up. All the dervishes in it were respectably dressed, and wore turbans, green and white, whereas elsewhere there was always a large mixture of *tarbooshes* and gray-pointed caps. The performances, however, were in all respects the same, except that, perhaps from greater practice or greater moderation, the excitement seemed never carried to so high a pitch as in some of the other tents. After every *mejlis*, or sitting, coffee and pipes were handed round.

From the camp we proceeded one night into the bazaars in the neighbourhood of the mosque of Sheik Bakri, which we found to be all lighted up, and crowded with people. The shops were open, and full of wares, especially cakes, and dried fruits, and sweetmeats of all kinds. Of course every coffee-house was crowded, and many extempore places of refreshment had sprung up. In one might be heard a story-teller, in another a singer; sometimes men, disguised as women, performed dances suited to Eastern tastes. There seemed a good deal of merriment going forward; and the men who came with grave faces and knitted brows from witnessing the performance of a *zîkr*, were soon grinning like true overgrown children. To a very late hour of the night the illumination and throng continued in this quarter; and in all the principal streets processions of dervishes occasionally passed, moving slowly along with great noise of drums and great flashing of lights, and cries and shouts, and every sign of joy and excitement.

The most remarkable sight to be witnessed during the Festival of the Prophet is, without doubt, what is called the *dôseh*, or ceremony of trampling. It takes place by day, and attracts an immense concourse of people. The *dôseh* is one of those numerous customs peculiar to Egypt, or rather to Cairo, which have been engrafted on the genuine Mohammedan practices. Whether they are of modern growth, or relics of some previous superstition, is difficult to determine. The ceremony I allude to is, on a smaller scale, not unlike in character to the progress of the car of Juggernaut; for it consists in a certain number of fanatics lying down upon the ground, closely packed, side by side, so as to form a path, along

which a heavy man, representing the Sheik Bakri, upon an iron-shod horse, passes at a quick walk.

The opinion has been expressed that the persons who submit to this trial are not injured. The Arabs, however, do not even profess this: they merely say that such as are *pure* escape, whilst such as are *impure* may be killed. I have heard of several instances of death ensuing; whilst, on the other hand, a very respectable authority has assured me that he knew a boy who, for a few piastres, would expose himself to be trodden upon three times in succession on the same day.

There are, in fact, three places at which this sight may be seen, between the Mosque of the Hasanain, from which the Sheik Bakri, or rather his substitute, takes his departure, and the house of that important personage, situated at the south-east corner of the Esbekiyeh; but at the first two only thirty or forty people lie down, whilst at the third sometimes several hundred come forward to try their luck. Determined to see as much as I could, I went to the ground early, before the great crowd had collected, and kept hanging about what appeared to be the centre-point for a very considerable time. The weather was most unfavourable. Violent gusts of wind raised immense clouds of dust, that darkened the skies for a time, and then swept away to hang like a threatening vapour over the city. The rich green acacias were in a perpetual state of agitation, tossing and waving their boughs, and filling the air with a mournful moaning sound. And yet the place where we stood, protected by a lofty wall, was at times unpleasantly hot. Our eyes soon became sore, our mouths full of dust, and our throats parched. Several times it suggested itself that a bowl of sherbet and a *shishah* might afford a fair compensation for the loss of the spectacle; but we stood to our ground, and at length had the pleasure of discovering, by the movements and growing excitement of the multitude, that the important moment was arriving.

After about ten minutes of unusual animation, several men bearing flags, and others armed with *nabootes*, came to clear a narrow alley through the crowd, in the front line of which I was fortunate enough to get. Immediately succeeding these couriers of the sheik came, two and two, those behind leaning on the shoulders of those before—a long column of young dervishes, worked up into a most repulsive state of excitement. They appeared to be perfectly intoxicated, and I have no doubt were so—the result being produced in some cases by *hashish*, or hemp-seed, in others by religious enthusiasm. Most of them wore pointed gray caps, a few tarbooshes, none turbans. The column passed me, swaying like one man from side to side, and uttering in a deep gasping tone the word 'Allah!' The lane formed through the centre of the crowd curved slightly, so that I could not see either end; and I was unable to count the number of dervishes that lay down. They were calculated at above two hundred. After they had been passing me rapidly for some time they stopped, and without more ado threw themselves flat on their faces side by side. I leaned forward, but could not see any termination to this human pavement. Several persons, evidently acting in an official capacity, now began running to and fro, arranging a shoulder here, an arm there, a leg farther on; examining that no spaces were left between the sides of those unhappy men, who all the while kept up a kind of convulsive twitching motion through their bodies, and shook their heads violently from side to side as they muttered in voices choked with dust the name of God, and invoked his help to assist them in the trial they were about to undergo for his sake, grovelling there upon the ground, in the sight of assembled thousands! The spectators seemed to interest themselves very much in all the arrangements; and I noticed that, obeying an impulse of humanity, one of them snatched up a child not more than ten or eleven years old, who had boldly lain down to go through the ordeal, and forced him to make way for a lad of about fifteen. The sight of these preparations produced a sickening feeling, and I became very impatient for the ceremony to take place. My suspense lengthened the time; for it was in reality not long after the pave-

ment had been formed that a buzz, a shout arose, followed by a dead silence, and then by an eager movement and forward pressure of the crowd, causing me nearly to lose my footing. What occurred was the work of an instant. A man on a powerful horse, preceded, supported, and followed by about a dozen attendants, moved with a quick lively walk over the bodies of the prostrate dervishes. My whole attention was attracted to the feet of the horse, which I distinctly saw to be shod with a flat plate of iron, as is usually the case in Egypt. Every one of the victims received the heavy tread somewhere near the small of the back; and I noticed one lad especially who writhed under it like a worm. I never saw anything more disgusting and painful than the sight that succeeded. No sooner had the representative of the sheik passed by, than the friends and relations of the dervishes snatched them up, surrounded them, and endeavoured to make it appear that they were not hurt. 'Declare the unity of God!' whispered they in their ears; and some of the poor wretches, though half insensible, murmured with their bleeding lips 'Wahed!' Many of them, however, were in an undisguised swoon, and lay senseless and ghastly; others responded with groans. Their general appearance was that of drunken men taken up from under the wheels of a carriage. In several instances the sufferers seemed to have fallen into fits resembling epilepsy; and one giant Arab attracted considerable attention by the violence of his struggles. I did not see a single man get up and walk away as if unhurt; but there is no doubt that a great deal of the exhaustion I witnessed arose from mental and bodily excitement. The tread of the horse, however, *must* have inflicted injury in many cases. I was told that two or three of the men died, but it was impossible to ascertain whether this was true or false.

A tremendous blast of wind, rising almost into a hurricane, swept over the Esbekiyeh as this painful scene concluded, and concealed every object except those near at hand in a dense cloud of dust. We hastened to take shelter in a coffee-shed, where, over a *shishah* or a *chibouk*, we discussed the events of the day. I am disposed to adhere to the opinion to which we then unanimously came, that there was little of hypocrisy in any of the actors in the extraordinary ceremony we had witnessed. All, or nearly all, seemed impressed with the deep importance of what they were doing; and both those who suffered—though some had prepared themselves with *hashish*—and those who officiated as assistants, from the burly representative of Sheik Bakri, to the meanest runner, I have no doubt believed they were concurring in a very meritorious action. That attempts seemed made to conceal any accidents, and to represent the result of the ordeal as more satisfactory than it really was, proves nothing but that men are anxious for the good reputation of their friends. I have heard some people maintain that there must be juggling in the whole affair; but I as distinctly saw the hoofs of the horse tread upon the yielding forms of the dervishes, as I see the pen trace these words on the paper before me.

During the succeeding night the *zikrs* were performed with unusual animation and vigour, and the *asharâhs* perambulated the streets more frequently and with greater noise. Until very near dawn, the lights of the camp twinkled through the trees, and the measured grunting of the dervishes might be heard at a vast distance. At length, however, all relapsed into repose; and when I walked out, late on the afternoon of the following day, scarcely any trace of the tents or the *kayim* could be seen. I passed the spot on my way to the house of an Englishman who lived in a garden quite in the Turkish quarter. He had promised me a good dinner; but I had scarcely put foot into his place, when I gave up all hope of anything of the kind; for I beheld him standing with a *kurbash*, or whip of hippopotamus' hide, over the prostrate form of his cook, who roared for mercy. Being averse to this mode of dealing with natives, I interfered, and discovered that Master Mohammed was a dervish, and had taken it into his head to lie down in the *dôsh*. The consequence was, that he could scarcely walk, and had only just arrived limping, with back bent, when I came expecting my din-

ner. A few pipes served us to pass the time whilst he repaired his negligence, and we enjoyed the fried fish, and cutlets with tomato sauce, perhaps much more keenly for the delay.

THE ITALIAN OPERA.

IN the age of Elizabeth, the English drama seemed to start into mature existence rather by creation than by the process of slow and gradual growth. Banished during the civil wars, and corrupted by the Restoration, and even by the Congreves and Wycherlys of a generation later, it regained much of its peculiar national vigour during the reign of the comic writers of the eighteenth century. Never was the theatre a more essentially national amusement than in the age when Goldsmith, Sheridan, and the two Colmans wrote for the stage; when Pritchard, Garrick, and Siddons trod the boards of Drury Lane or Covent Garden; and Macklin and Foote, treading in the paths of Cibber, united the parts of author, actor, and diner-out of the first lustre.

The French revolutionary wars, and the rise of a new poetical and romantic literature, deprived the stage of its pabulum. None of the great writers and poets of the Scott-Byron era were really successful on the stage. The actors a generation ago were as good as ever. The grins of Mathews, Liston, Dowton, and Munden were as broad as those of Quick, Suett, and Parsons had been, but new dramatic writers were wanting. The great theatres kept playing the comedies of the old stock after they had ceased to hold the mirror up to the manners of the town, and after two-thirds of the allusions had ceased to tell; and instead of original pieces, the grand resource was the translation of French plays. The consequence was, that as soon as London came to have a permanent French theatre, the rich and fashionable ceased to frequent Drury Lane and Covent Garden; and in this they were imitated by that portion of the middle class that apes the aristocracy. Hence the jargon about the *decline of the national drama*. The drama in Great Britain has declined because it has ceased to be national, and because nine-tenths of the so-called national dramatists are translators from the French; for who that has ever seen 'La Reine de Seize Ans' could endure to have the sparkling wit of Bayard decanted into the rapid 'Youthful Queen?' One might as well expect to enjoy champagne served from pewter quart pots. Last year the English actors petitioned the legislature to be allowed protection against foreign competition; but they would have acted with greater wisdom had they petitioned Dickens and Thackeray to send their comedies to the Hay Market instead of Bouverie Street.

But the great cause of the swamping of the English drama, is the tide of music which has set in from the continent with such irresistible force. The natural philosopher may like it or dislike it, but it is far too remarkable a sign of the times to be left unnoticed by the student of living manners. Let us hope that a prejudice against music which exists in the minds of many men of the highest attainments in science and literature, is gradually giving way to the sentiment that the science of sweet sounds is as essential a part of civilisation as the vivification of form and colours by sculpture and painting, and that the perfection of civilisation is neither in science alone—in commerce alone—nor in the purely imitative arts—but in the concurrence of all. How catholic is the spirit of a Fuseli as compared with that of many of our greatest one-sided thinkers! 'I know,' said he, 'that the productions of Mozart and Beethoven are of the highest excellence, because the best judges say so; but to me they give no more pleasure than a finely fore-shortened limb of Michael Angelo does to an unpractised eye.'

But there never was any period of civilisation in which all the arts flourished simultaneously, and there probably never will be. In the perception of the graceful in form, nothing has equalled the age of Pericles; in

painting, or the vivification of colour, there is the rise of the art in the fifteenth century, and a dreadful falling off after the conclusion of the seventeenth, for Vanderheyden, the last of the Dutch school, died in 1712, and Carlo Maratti, the last of the eminent painters of Italy, in 1714. Music is the only one of the fine arts in which the present can be called a really luminous period; and it requires no great power of divination to foresee that when the present cycle of musical production is completed, the names of Rossini, Meyerbeer, and others, will be enshrined as classics by a generation as remote from them as we are from the great Italian and Flemish painters of the sixteenth and seventeenth centuries.

With the fact of London being the only capital in Europe that ever had at the same time two first-class Italian Operas, it can no longer be said that we are not a musical people. Mere fashion will not account for this: it is not to be denied that a decided taste for highest-class music has descended rapidly to all branches of the middle ranks; and we therefore imagine that a more familiar acquaintance with the management of Italian theatres, both Cisalpine and Transalpine, and the manners and customs of the profession, will not prove unacceptable.

The musical capitals of Italy are Naples and Milan. All the talent of the south converges to the former city; that of the north to the latter. Here are the great *conservatories*, as they are called, where the young musical idea is taught how to shoot; and here are the largest and best-appointed theatres; but both in instruction and stage appliances Naples takes the precedence of Milan. The theatre of San Carlo in the former city is larger than that of La Scala in the latter, and the conservatory of Naples has a higher reputation than that of Milan; the late director having been Zingarelli, and the present being Mercadante, the most scientific of all the modern Italian composers. But any one from the north of the Alps would wonder how the science of sweet sounds could be learned in such a place. He might think it rather the *hell* of Dante's 'Divine Comedy,' for while he is almost inclined to smile at the groaning of a violoncello, which the small legs of a tyro can scarcely compass, a violin at his right ear jars painfully on the nerves, of which he is no sooner sensible than a wind-instrument, which the performer has scarcely strength sufficient to sound, strikes so disagreeably on the other tympanum, that he thinks of Tasso's 'Rauco suon della Tartarea tromba.'

Most of these youths belong to the humbler classes of society, but strange fortunes and misfortunes often bring upon the Italian stage both male and female singers who have never passed through a conservatory. For instance, a young man of ancient and noble family, passing rich with an appanage of forty pounds a year, has cultivated music as an amateur; his voice and style have been admired; his small patrimony is still further reduced by the gaming-table; or, discontented with vegetating in a small provincial capital, he covets the easily gained wealth of the Operas of London or Paris. He changes his name. His musical education is complete, for he has done little else but sing all his mornings these dozen years; a few months' practice in the provincial theatres acquaint him with the routine of stage business; and in a few years he makes an income in Paris or London quadruple that of the richest of his relations. This produces the most curious contrasts in the families of Italian singers residing in London. A tenor or bass is perhaps a man of exquisitely-polished manners, whose relations one may have seen in the best society of Italy; while the beautiful and now accomplished *prima donna*, who has passed through the conservatory, has for a protector some brother or uncle from a village of the Abruzzi or Bergamese, with sunburnt features, huge brown hands, and an incomprehensible patois.

Musical education is frequently carried on in towns where there are no conservatories, on the speculation of a music-master, who receives a moiety of a young

singer's profits for a term of years—a system which gives rise to some amusing lawsuits; since the pupil, if highly successful on the stage, usually gets restive long before the expiration of the term mentioned in the contract. The arrangement, however, is usually advantageous to both parties; for these undertakers of musical education are generally in relation with the conductors of theatrical agency, through whom most engagements are made in the earlier stage of the career of an artist.

Singers very rarely begin with the larger theatres of Italy, but generally with those of the third or fourth class. In the first rank are Naples and Milan, which have good singers all the year round. In the second are the Fenice of Venice, the Pergola of Florence, and several others, which shine in their full lustre only during the carnival. In the third rank are those towns that have their good Opera singers not during the carnival, but in spring and autumn. The fourth class may be considered to be those that have their Opera season in summer, or a carnival season of inferior singers. At these last-mentioned places may be heard the same singers who in after-times become famous. In the little town of Cremona, in the year 1835, the writer of this article saw the early campaign of Marini, then unknown to fame, and now the excellent first bass at the Queen's Theatre—for London and Paris, or latterly St Petersburg, absorb the prime of a singer's vocal powers; the best performers on the Italian stage being either those whose reputation is not quite in full bloom, or who have been superseded as favourites in France and England by younger and more vigorous powers. The consequence is, that while in London freshness and strength of voice are combined with dramatic experience in the same individual, on the Italian stage they are in union with a merely peninsular reputation; or if there be a European name and artistic experience, they are conjoined with an organ somewhat the worse for the wear. But these old singers, although giving less pleasure to the Italian public, contribute by their style of performance to model the rising generation, and to keep up the native school of the lyric drama, in which even the Germans, with their more profound musical science, are decidedly inferior to the Italians.

Thus owing to the demand for young singers in the theatres of the north, the tasting of wine and tea is not better understood at the Docks of London than the *tasting* of singers of rising talent in Italy. The tasters know by a singer's countenance, before he opens his mouth, whether he be a bass or a tenor, and on hearing him, can not only tell exactly what are his voice and style, but what they are likely to become. These tasters are always a sore annoyance to a manager in possession of a singer engaged under a remunerating contract; and the manœuvres and counter-manœuvres between them are like the intrigues of politics and law. The greatest manager of modern times was a certain Signor Barbaja, who, during all the prime of Rossini's genius, was the *Impressario*, or undertaker of the principal theatres of Italy, and had in fact a sort of musical monopoly of the Italian capitals. One evening, seeing through the hole of the curtain a person whom he knew to be a taster for the Opera of Paris, and dreading that he might have some design upon his prima donna, he waited until the grand scena of the lady was ended, and stationing himself at the side-scene, declared with enthusiasm that she had covered the Italian lyric drama with glory. The poor prima donna, in an effusion of tears, could scarcely express her gratitude; and the warm-hearted manager, finding her in the melting mood, produced a contract for three more years, with a small rise of salary, which was at once signed; but a new light broke in upon her on receiving next morning, and just in time to be too late, a letter from the Paris agent, offering her a considerably higher sum. Once signed, these contracts are usually so binding that there can be no mistake—the only releasing circumstances, such as the burning of the theatre, being especially mentioned.

An Italian opera consists of two acts—the first always longer than the second. 'Otello' has three acts; 'L'inganno Felice' only one; but these are rare exceptions. The singers absolutely indispensable to every Italian Opera are a prima donna with a soprano or mezzo-soprano voice, a tenor, and a first bass. Nearly all the inferior male parts are written for bass or bary-tone singers; voices of this description being much more abundant than tenors. In many operas principal parts are written for a bary-tone; and a very few, such as *Tancredi* in 'Tancredi,' and *Arsace* in 'Semiramide,' are written for a contralto (a female voice with low notes), as there are many good soprano voices for one contralto. All the buffo, or comic parts, are written for basses or bary-tones of small compass, and are a sort of refuge for those middle-aged and elderly basses who, having no longer sustaining power and tenderness, make up for the loss of their voices by comic acting. This remark is of course not applicable to England, where the buffo parts are filled by singers still in their prime. But the distribution of compass is very much determined in new operas by the accidental capacity of the company for which the composer writes; all the effective notes of a singer being brought out with a view to the first success of the opera, which is the grand point.

After the distribution of parts, the composer tries over all the solo and concerted pieces with the singers at the pianoforte, and alters and amends according as his judgment directs. Meanwhile the chorus has been practising; and it is not until both singers and chorus are well drilled at the pianoforte that the first *insieme*, or general rehearsal with the orchestra, takes place. An orchestra very soon gets its part; and the stage rehearsals in a good company are more for the sake of the groupings of the chorus, and the stage effect, than for any material advancement of the purely musical business.

The first night of representation is one of agonizing suspense to both manager and music-director. The singers have all eaten a very light and early dinner, and having been fasting for several hours, are in prime vocal condition, which they aid by a few anchovies or a glass of wine; and the composer having taken his place in the orchestra to direct the music himself, the opera begins. In Naples the royal family usually attend a first performance; and according to etiquette no one can applaud until the king sets the example from his box. If an opera, therefore, please at first hearing, as was the case with many of those of Donizelli, which came out mostly at Naples, the impatience for the signal from the royal box becomes feverish; and when this comes at last, the result is like an ice-pent torrent let loose. There is scarcely such a thing as damning an opera on the first night. Any glaring impropriety in the dramatic part of the arrangements is unceremoniously hissed; but final judgment on the music is never passed at once, as an opera does not make the instantaneous impression of the spoken drama, and its beauties do not always lie on the surface. For instance, 'Norma,' now the most popular of Bellini's operas, was coldly received on its first production; but as the Opera is in Italy the nightly lounge, and a sort of social exchange, the merits of a new production soon rise to a premium or fall to a discount. But success in Italy by no means insures a composer a European reputation; for, on account of the perpetual demand for new operas for the carnival season, many a musical hero who, like Ricci and Coppola, has conquered a Cisalpine reputation, cannot pass the Alps and fix his productions securely in London, Paris, or Vienna; and a firm footing in these capitals is the great test of the excellence of either new operas or new singers. We may, therefore, now quit the sunny south, and turn our attention to the state of the music nearer home.

The history of the Italian Operas of London and Paris previous to our own period has been so frequently written, that it would be quite beside our purpose to go farther back than 1814. In that year the conti-

nent was reopened, and Rossini, by the production of 'Tancredi' at Venice, began the bright part of his career. Previously, Italian music was in England little more than a fashion. It was Rossini more than any other composer who first created that vivid and widely-spread relish for it which has now taken a firm hold of even the middle classes. 'Tancredi,' the 'Barber of Seville,' 'Semiramide,' 'Gazza Ladra,' 'Cenerentola,' and the other operas of this master, were successively reproduced in London and Paris, and held undisputed possession of the Italian theatres of these cities until 1832, when Bellini divided public attention in the 'Pirater.' Both these composers visited London, their persons and manners being as different as their styles in music. Rossini is strong, lusty, and corpulent, and was made such a lion of by George IV. and the principal nobility, that Theodore Hook, in one of his novels, talked sneeringly of 'a great personage, such as Signor Rossini or the Emperor of all the Russias.' Bellini, whom the writer of this article frequently met during his visit to London in 1833, was quite different: he was slim, pale, and genteel, with very modest manners and a soft voice. We recollect that he was on one occasion dreadfully puzzled in an attempt to understand the British constitution, while we endeavoured to explain the functions of each part of the machinery. This will not appear surprising when we see what a sad business foreign dramatists and novelists make of Lords and Commons. Even M. Scribe, with all his historical reading, makes a peer and ousted cabinet minister enter into a dark intrigue to become lord mayor of London! On the death of Bellini, Donizelli continued his prolific career with a series of operas, less exquisitely beautiful, but much more varied in character, than those of Bellini; and on his mental derangement occurring a couple of years ago, Verdi remained the only effective living composer of the Italian school, Rossini having produced no great original opera for twenty years.

The Italian Opera of Paris might be said to have the same company as the Queen's Theatre; for, beginning their season in Paris in October, it was terminated in holy week, so as to make the high season of London comprise the months of April, May, June, July, and the half of August. The opening of the Covent Garden Italian Opera effected a great change in this system; the hard work of rehearsal was all done in Paris, and the singers in London had an easy time of it, in merely repeating the lessons already learned; but through the energy, perseverance, and talents of Signor Michael Costa and Mr Balfe, the rehearsals in London are now as laborious as in Paris, and as independent of mere imitation; while, by the translation of the best works of Meyerbeer and Auber, the repertory of the Italian Operas of London has a richness and variety of character unknown to the native Italian stage.

The first-class Opera singers are generally a quiet, gentlemanly, and well-behaved class of men, utter strangers to those dissipations that used sometimes to incapacitate our Cookes, Reeves, and Keans from performing: they usually reside in Regent Street, the Quadrant, or St James's Street, and some of them are much attached to London, while others have the affection of saying that there is no existence out of Italy. One of these said to a well-known buffo that London was quite an exile; to which he answered, 'Yes, and a very agreeable exile too.' The actual salaries in London are not much larger than those of Naples or Milan; but the concerts produce a large sum, the income derived from singing a few songs at two or three concerts being sometimes, with much less labour, more than the salary of an Opera night. Italian singers may thus realise a large fortune in a few years; and Donizelli and many others are extensive landed proprietors in Italy. The greatest prima donna of our age, however, had the misfortune to see her large accumulated wealth dissipated in a few years by a gambling husband. In no profession is it more true that

hay must be made while the sun shines. A well-known tenor was accustomed to make his two thousand pounds for many seasons during the London summer, till his voice fell off, and other favourites obtained the public ear. Unwilling to quit London, he remained at a salary of £800 for the sake of the concerts; soon he fell to £300; and at last begged the manager to allow him to sing for nothing, that he might the more readily obtain pupils, and was refused!

So much for Italian music, of which we make so large an annual importation and consumption. It must be confessed that the balance of trade is terribly against us; for Mr Balfe is the only English composer whose productions have stood the voyage across the Channel. Him, however, we may congratulate on the signal success that has attended the production of his operas over all the continent of Europe.

CALIFORNIA—COMING DISAPPOINTMENTS.

UNLESS all experience is vain, and something like a miracle should take place, we must quickly hear of miserable disappointment and great disasters in California.

We argue thus from the history of all former gold-diggings where the circumstances were similar. The gold hitherto found in the valley of the Sacramento and neighbouring regions is, as is well known, mixed with the alluvial matter of the country, along with which it has been brought down in the course of time from the mountains, the lighter particles, as usual, travelling farthest. In all cases hitherto, such deposits of gold have never lasted long in their pristine abundance. After the first and best harvest has been reaped, the washings become comparatively unproductive, and soon they cease to remunerate the labour expended on them. After that, there is no chance of gold but by excavating it from its native seat in the mountains, where, however, its amount is so uncertain in proportion to the labour, that even in South America proverbial wisdom treats gold-digging as a bad business.

What, however, gives us most reason to fear for the upshot of this Californian crusade, is our knowledge of the dangers and difficulties of the way, and of the state of the country itself.* To reach the sickly valley of the Sacramento, and the still more unwholesome narrow ravines running into it, a voyage or journey of incredible fatigue and peril must be surmounted, whether by the long northern land journey, or by the sea and land passage by the Isthmus of Darien. The sea voyage round Cape Horn for ill-provided emigrants in a crowded transport infers an amount of human suffering which may be left to the imagination of the reader.

The adventurer who chooses the first and most direct route will have first to travel from a thousand to fifteen hundred miles across the United States: here a well-lined purse will overcome all difficulties. Then commences a second journey of fifteen hundred miles through a wild country, without roads, or inns, or inhabitants—almost destitute even of water. The traveller ought of course to be provided with every necessary for the whole way at setting off; but such an outlay must far exceed the means of many who will only make the discovery too late to retreat. They will be induced to attempt the journey without due provision for their subsistence or safety, and their bones will be left to whiten the prairie. The toils and dangers of their more opulent companions, well provided as they may be, will be excessive. The bitter piercing cold of the night, as the fierce wind sweeps over the boundless plains, penetrates to the very bones. The noontide fervour of the sun is an opposite, but not less serious evil, under which human strength sinks and dies. As the heat hourly increases, the breeze languishes, and the saline vapours arising from

* The present paper is the production of a gentleman who is personally conversant with the countries he refers to.—Ed.

the earth, being then no longer agitated or dispersed by its impulse, give rise to the phenomenon of the mirage. The wayfarer, exhausted by heat, dust, and thirst, is then tantalised with the cruel deception of lakes and streams of water flowing around him, and extending before him as far as the eye can reach, yet ever eluding his approach. The delusion is so complete, that dogs, languid and disheartened, will at first dash forward with sudden energy to rush into the seeming grateful fluid, and enjoy its cooling refreshment. Absence of water is one of the great deprivations of this country; it is often the cause of the severest sufferings of the traveller and his cattle, and frequently occasions the loss of beasts of burthen. Persons of nervous temperament occasionally endure excessive irritation from the excitement created by this continual exhibition of deceptive waters upon their parched throats while suffering under the effects of protracted thirst. It in some constitutions proceeds to such excess as to produce spasms and severe nervous attacks; and the sufferer is then compelled to submit to the disagreeable necessity of riding blindfolded, as the only effectual antidote to the exciting cause of his illness.

During a considerable portion of the year, the rain and snow render these plains seas of impassable mud. The practicable seasons for the journey, therefore, are limited to the intervals between this wet period and the time of excessive heat and drought. Strangers, not aware of these circumstances, may arrive on the frontier at such a time of the year as will oblige them to remain stationary for some weeks or months before they can proceed farther on their way. For a short season, when sufficient moisture and heat are combined, some of these plains, where sand prevails, present a scanty vegetation, affording beautiful specimens of flowers in detached masses. The sight of some of these plants in conservatories or gardens in England is apt to inspire an erroneous opinion of the fertility of their native soil. In reality, verdure and herbage for cattle are there unknown, and a few brilliant flowers scattered over the surface are a poor compensation for the want of them. The whole land assumes the substance and appearance of an unburnt brick when dry; where clay or loam prevails, it becomes, when moistened, a plunge of mud, but also exhibiting here and there fine flowers.

During the greater part of this long journey the travellers, if not in strong force, are liable to the attacks of the Indians, usually the fierce Apaches, who make sudden irruptions from their distant abodes on the more civilised inhabitants of the frontier of the plains, and kill or carry off any stragglers that fall in their way. In these usually barren regions are occasional fertile spots blessed with sufficient water and vegetation, each forming an oasis in the desert, the favourite resort of these Indians—men wild, ferocious, and without mercy. Wo to the unhappy traveller who encounters them in their forays! Mounted upon hardy, active horses, frequently the plunder of former excursions, they sweep over the land, carrying death and devastation in their course. Appearing when their presence is least anticipated, they vanish again as suddenly into their unapproachable fastnesses in the desert. It is difficult in peaceful England to imagine such a state of precarious existence as the life of the emigrant or the traveller in these countries daily presents.

The shorter journey through the mountain defiles on the Isthmus of Darien or Panama is not less prolific in danger and suffering. The Atlantic coast on the whole of the isthmus is fatal to Europeans during many months of the year. Between the end of February and the beginning of October, one week's residence on shore is a trial few strangers go through without an attack of yellow fever. The miserable, stupid, indolent native Indian alone resists for the period of a short life the baneful effects of the climate. The smallest service these half-animated beings can be induced to perform is to be remunerated with a dollar; they appear to have no conception that five minutes' exertion can be re-

compensed by any smaller coin. It may be supposed from this that travelling is here expensive; and should the traveller be unprovided with sufficient apparatus against the reptiles and insects everywhere besetting him, even at more favourable seasons of the year, such as raised bedsteads, their feet immersed in pans of oil or water when in use, hammocks, mosquito-curtains, &c. he will inevitably endure a degree of torment from their persecutions unimaginable to natives of our temperate climate. Reptiles of the most poisonous description present themselves in alarming profusion; snakes in many varieties, large and small; centipedes, scolopendras, and similar lengthy creepers; scorpions in multitudes. Tarantulas, and various enormous spiders, said to be venomous, are met with. At night, monstrous beetles of disgusting odour will, uninvited, alight upon him; while large bats, attracted probably by the light colour of his bedding, will flutter about him, and dispel his sleep; or, if slumber overtakes him, the vampire may settle upon him, and suck his blood, greatly to the detriment of an already reduced constitution.

Arrived at the western or Pacific shore, supposing the traveller to have surmounted the toils of the way, his perils are only varied, but not abated. On this coast the myriads of insects and reptiles are undiminished; and although the yellow fever is here unknown, there is little cause of congratulation for this exemption, as its place is most efficiently supplied by the peculiar scourge of these coasts, the fatal fevers of intermittent type. So inimical to the health of strangers is this destroyer, that in 1826 a Congress of Deputies from some of the new republics, which was held at Panama, though composed of native Americans, some of whom were of Indian extraction, and though supplied with every comfort available for the climate, was broken up after two or three sittings, and obliged to adjourn to a locality more congenial to strangers, sickness having already made such inroads among them, as in a short time to threaten the total extinction of their numbers. And this was not in the worst season of the year.

The emigrant, on his passage to more distant shores, must await the sailing of the vessel that is to bear him to his destination, and an interval of many weeks may elapse before he finds an opportunity of quitting the shores of the isthmus. Ere that time has arrived, the departure of the ships will in all probability be a matter of indifference to him, for the most sufficient of all reasons. Should he fortunately get on board ship, another tedious voyage in a crowded vessel within the tropics awaits him. If the traveller arrives in these countries during the rainy season—for here the rains are periodical—all his difficulties will be increased. A European can form little idea of these tropical showers, though he may imagine the discomfort and danger of having his clothes alternately soaked in water and drying upon his back during his entire journey.*

The emigrant, once landed at San Francisco, must not suppose his difficulties at an end. He must be prepared to receive the heaviest calls upon his already

* There is a comparatively direct road to California through Mexico, landing at Tampico, and embarking at San Blas on the Pacific in the north; or landing at Vera-Cruz, and embarking at Acapulco in the south. The sea voyage in the Pacific is thus materially shortened, and that in latitudes nearest the line. The land journey is through a civilised, healthy country, with the exception of fifty or sixty miles on approaching the ports. During the whole journey, homely accommodation can be obtained, and several large towns are passed on either route, where any deficiencies may be supplied; but the Spanish language is indispensable, not a word of any other European tongue being known there. This same difficulty must occur in crossing the isthmus; but there the distance being only short, the traveller can, and indeed must, depend more upon his own resources, and require less communication with strangers, except at the ports, where probably English will assist him. Whether there is any direct communication between San Blas or Acapulco, and the port of San Francisco, must now be a subject of inquiry, as, till lately, there was little inducement for frequent intercourse, and only chance occasions occurred of passing from the Mexican coast to that of Upper California.

impooverished funds, to enable him to proceed into the gold districts. None but the wealthy can afford the price of a mule or horse, if they are procurable even for money. The commonest necessities of life are 400 or 500 per cent. dearer than in the countries he has left, and the poor adventurer will soon discover that his only means of subsistence, at least for a time, is by servitude, until he can amass sufficient resources to enable him to venture on the journey into the interior. The report of wages of a dollar an hour, or even two hours, to a porter sounds promising; but when boarding at the humblest table, with only water to drink, costs now one pound per day, and lodging and washing are paid in proportion, at the end of the week there will be found only a moderate residue from such earnings. The place has now also become the resort of desperate characters from the ports of South America, and the wildest adventurers from the cities of the United States. The unsettled wanderers of Texas, and deserters from the army, with runaway seamen from the South-Sea whalers, and the idle profligates abounding in the islands of the Pacific, compose the mass of the population, without law, religion, or morality. The accounts of rapine and murder from the district are what might be expected in such a society. Fourteen detected murders are stated to have taken place at the diggings shortly previous to the writing of a letter conveying the intelligence.

While this evil has been gradually gaining ground, the first vague reports of the immense discoveries of gold remain unconfirmed by proportionate importations of the precious metal either into the United States or into Europe. In reality, the value of the gold hitherto announced to have been received scarcely indicates a gold region of more than ordinary richness, if it even attains to that standard, the whole sum not amounting to the eighth part of the produce of the mines in the Ural Mountains in the same time. The whole history of this marvellous land of treasure seems now to be resolving itself into a land-jobbing speculation of some go-a-head Yankees to attract population to their waste allotments. This view of the case becomes more probable on recollecting that this is not a new-discovered country. The Spaniards, always most diligent in their mineralogical researches, possessed it, and had missions near San Francisco, and consequently not far from the valley of the Sacramento, administered by men of skill and ability, who almost to a certainty must have seen, or had some intelligence of, this store of wealth, if it existed in such abundance. The Indians, also, of all the tribes, are well aware that gold is the most valuable article that they can bring when coming to traffic with civilised men, as they have long been in the habit of doing; accordingly they bring some gold, occasionally in large pieces: but if a land so prolific in this metal had been known to them, horse-loads instead of a few pounds would have been offered in barter at the stations. Not long since the Oregon territory was the attractive point of resort, and dreadful sufferings and loss of life were sustained by the hasty adventurers hurrying there to obtain the first choice of settlement in the anticipated paradise. Unfortunately, a great part of the favoured land proved on trial to be uninhabitable, and most of the remainder appeared only a poor ungrateful soil for cultivation. It is much to be feared that many now blindly hastening to enrich themselves in the gold regions will, if they survive the experiment, have to retreat as light as they came in search of some more fertile soil, where they may provide for their maintenance by the cultivation of a few yams or potatoes, as the climate may serve. With tolerable industry they may soon be surrounded with sufficient supplies of the necessities of life, if they have located themselves judiciously; but little beyond this is to be expected in a country where the wants of all the inhabitants are similar, and their means of supplying them equal. The golden dreams of regal wealth will in all probability be only realised in the form of a log-

house if trees are near, or a mud-hut on the mountain, with a plot of cultivated ground; where, instead of gathering gold by handfuls, the proprietor must devote some portion of his time and attention to the protection of his most valuable property, by scaring away birds and other granivorous enemies from his maize-field, and learning the art of making tortillas and attolle of the grain of the Mexicans, or mush and hominy from their United States neighbours.

THE LACE-MAKERS OF SAXONY.

WE have already given some details respecting the lace-makers of Ireland, and it may be curious, if not useful, to bestow a glance likewise upon their German sisters. The district of Erzeberg is situated amid the mountains of that name which separate Saxony from Austria, and its inhabitants are all of the industrial class, consisting chiefly of blacksmiths and lace-makers. The former artisan, though working constantly at his rude profession, is seldom able to lay by anything for his old age. Commencing in early youth, the ordinary results of his labour are blindness and deafness, which make his age useless; and so, leaving the anvil, he wanders with a beggar's wallet from door to door, until one day he entirely disappears, and is forgotten. This course is so common, that when a man is suddenly missing, and nothing more is heard of him, it is said 'he has gone like an old blacksmith.'

The lace-makers are a more interesting class, and are composed wholly of women and children. When they are thus employed, the management of the house is entirely given up to the men, whose duty it then is to cook and wash the linen for the family—the fine threads of the lace requiring the more skilful and delicate fingers of a woman. A good workwoman, in favourable times, working morning and night, was generally able to earn from 6d. to 7½d. a day; but during last year the most industrious among them could not gain more than from 1½d. to 3d., and many are now entirely without employment.

The three principal villages of the district, containing collectively nearly 7000 inhabitants, are built on the most barren part of the mountain, and all on the same plan: each house has but one floor, roofed with shingle. In consequence of the late distress, these villages now present the most wretched appearance. Bundles of straw fill up the holes in the broken windows, while the apertures the weather has made in the roof are unstopped, leaving a free ingress to the rain and snow. It is not an uncommon thing for three or four families to be crowded together in one small room, with perhaps no other bed than an armful of straw thrown on the bare earth, and rendered more suffocating in winter by the heavy smoke of the green branches with which the stove is fed. Each house is generally provided with a small piece of ground, which the men cultivate literally by 'the sweat of their brow,' although it yields nothing but potatoes, which, seasoned with salt, are the usual food of the lace-maker and her family. Bread and butter is a rare dainty with them, and many have never tasted meat in their lives. One of the luxurious dishes of these poor people is a baked potato-cake, soaked in a kind of syrup made of beet-root sugar. They drink what they call coffee three times a day; that is, a compound of chicory and particles of roasted beet-root—the former used in small quantities, as it is now too expensive for their small means. Added to the accidents of bad crops and low wages, they are cheated by rogues somewhat less poor than themselves. These are wandering pedlars, who, speculating on the necessities of the moment, roam from one village to another, lending small sums of money at usurious interest to the inhabitants, who, to relieve their embarrassments for the moment, are probably ruined entirely in the end.

Yet in this situation, miserable as it is, they have their compensations, preserving as they do a beautiful

gentleness and contentedness of character. The manufacture of lace has given them the habit of extraordinary cleanliness, and the slightest unexpected recreation consoles them for all their hardships. The women are fond of music and dancing, and during the beautiful summer evenings the young girls sit in a circle, and join in singing, as with one melodious voice, their popular airs. In winter, from Michaelmas to Easter, many families assemble at one of the houses; each woman brings her work, and thus economising the light and firing, escapes the dreariness of solitude. Each in her turn enlivens the evening by recounting some old superstition or traditional story. But in the depth of winter few are so hardy as to venture from the house; when they do so, however, they envelop themselves in an old cloak, one of which is possessed by every family, and serves to protect each member of it by turns from the cold air. In this cloak the father wraps his child, and carries it through the snow to school, where he leaves it, with a morsel of bread or a potato-cake, until the evening, when he returns, and carries it back as before. When the child is old enough, it is taught by its mother to make lace, and soon is capable of earning perhaps a penny a day.

Thus live thousands of beings in obscure and permanent isolation in the midst of that Germany where there has latterly been so great a change, and within a few leagues of those great towns where their beautiful embroideries excite so much admiration and cupidity. Government has lately taken the condition of this poor colony into its consideration, and has willingly lent them its aid; but unfortunately, from taking the wrong method of doing so, the help has been worse than useless. A sum of L.8000 has been expended in purchasing the remnants of old lace remaining useless in the presses of the fabricators and dealers; but the merchants alone have profited by this thoughtless measure, and the wages of the lace-makers remain as before.

CHRISTMAS IN ENGLAND AND AT THE CAPE.

THERE is no denying the self-evident fact, that our holiday season comes at the wrong period of the year. Christmas and midsummer do not agree well together. In the northern hemisphere, the joyous week which ushers the old year out and the new year in, falls, not by an accidental coincidence, at the time when men have most leisure for enjoyment—when labour of all kinds is little required, if it be not absolutely forbidden by that inclemency of the weather which serves to heighten the sense of the domestic in-door pleasures proper to the season. Then, too, the scattered members of families seldom find their avocations so urgent as to prevent them from meeting, to re-knit the ties of old affection, about the cheerful hearth and the social board.

Then merry games and unfashionable dances, in which all ages join, awaken a hearty pleasure, such as a formal ball-room never knew. Then, on the continent, the Christmas Tree displays its annual glories, diffusing radiance from its hundred lights on the happy faces about it. Then, through the clear crisp air of winter are heard the voices of the wandering singers, last remnant of English minstrelsy, appealing to the charity which at that season can rarely fail them, and reminding their hearers, in the simple strains of antique harmony, of the solemn reason for their happiness:

'God rest you, merry gentlefolk,
Let nothing you dismay,
For Jesus Christ our Saviour
Was born on Christmas-Day.'

The same sufficient cause remains why, under such altered circumstances as prevail in this southern region, the season should still be duly commemorated. Unfortunately, however, as has been already remarked, the time of the year is most unfavourable for holiday making. Coming, as it does, in the middle of harvest in the country, and at the busiest season of the year in

town, it finds the people unable or indisposed to yield up their valuable time to the claims of domestic festivals. Neither Christmas nor the New Year can be celebrated in this land with the same hearty pleasure and care-forgetting zest with which they are welcomed in England, Holland, or Germany, and indeed throughout the whole of Christian Europe.

There is rarely an evil without its compensating good. There are in Great Britain some millions of people to whom Christmas is the only day of real enjoyment in the whole year. More than three millions—one-eighth of the whole population—are in the receipt of parochial relief. These unfortunates generally receive, through the favour of the parish authorities, or the liberality of charitable Christians, a hearty dinner of the national roast-beef, plum pudding, and 'humming ale,' their only good dinner throughout the year. And on these viands the poor creatures make merry about the workhouse table—a dismal mirth at the best.

There are many more millions whose state is little if any better than that of the unhappy paupers. There are agricultural labourers overworked, ill-clad, badly housed, toiling from day-dawn till dark for a pittance which barely sustains life; sturdy men with families labouring through the year for a weekly wage of 7s. or 8s. There are myriads of hard-working operatives in the towns, crowded in wretched cellars and garrets, earning barely sufficient to support life, on inferior and unwholesome food. Once a year, with much pains, and pinching, and forecast, all these suffering millions generally manage to procure a single meal of unaccustomed plenty and savour. Numerous are the devices to which the poor pale mother must resort in order that the eyes of her ragged brood may sparkle with delight at the sight of a real Christmas pudding. Many in these classes eat meat but once a year. Not a few, particularly in Ireland, live and die without ever having tasted animal food.

It is hardly necessary to speak of the contrast presented by the ordinary life of all classes in this colony. To many millions in the mother country the easy toil and abundant food of the poorest here would seem like a perpetual holiday—Christmas the whole year round. The enjoyment which we, owing to the difference of seasons, cannot well concentrate in a brief series of festival days, is diffused, in superabundant measure, over the whole circle of the year. And this, it will be admitted, is good substantial compensation for a misfortune which, after all, is chiefly imaginary.

We shall be reminded, however, that this advantage is due in a great measure to the circumstance of the colony being a newly-settled country, and the population very scanty in proportion to the abundant resources of the soil. As the number of inhabitants increases, this proportion will be gradually altered for the worse; until at length, even here, pauperism, with all its attendant miseries, will make its appearance, to diminish the general sum of happiness, and perplex our lawgivers with evils more real and more dangerous than those temporary grievances (the natural result of the present superfluity) which now occupy their attention, and give birth to voluminous 'blue-books.'

There is a certain amount of truth in this view—so much, indeed, that it deserves our most careful consideration, in order, if possible, to discover how these anticipated evils may be, at least in part, avoided. Now is the time, in this early age of our country, when its condition is yet plastic, and its destinies may be moulded by laws—this is the time when our legislators should make it their especial care so to establish the frame of our society, and the distribution of property, as to preclude those unnecessary evils, and those painful contrasts, which are seen in many countries of Europe, but chiefly in Great Britain. By the laws of nature there will be in South Africa, as elsewhere, great wealth and great poverty; wealth, the result of industry, temperance, and frugality; poverty, the fruit of indolence and vice. But it will depend chiefly on

human laws whether there shall exist here also that fearful and unnatural inequality which bestows on one part of the community, and that not the most deserving or the most industrious, superfluous riches and corrupting luxuries, while it dooms the toiling millions to perpetual want and almost hopeless misery.

If we have been betrayed into a rather more serious vein of speculation than the occasion seems to call for, we must plead the example and excuse of the poet. Journalists are sometimes, like song-writers, led away by the concatenation of ideas and phrases, and might commence their lucubrations, as the Scottish bard began his poetical epistle, with the frank admission—

'But how the subject theme may gang,
Let time and chance determine;
Perhaps it may turn out a sang,
Perhaps turn out a sermon.'

But, after all, a sermon is not inappropriate at Christmas; and a little serious thought, we are assured on great authority, can never 'make our pleasures less.' With this persuasion, we will close our present admonition, in more cheerful guise, with the 'compliments of the season,' wishing to each and all of our courteous readers a merry Christmas-tide, and the happiest of New Years.—*Cape-Town Mirror.*

CIRCUMSTANTIAL EVIDENCE.

A negro who had run away from his master in South Carolina, arrived in London in an American ship. Soon after he landed, he got acquainted with a poor honest laundress in Wapping, who washed his linen. This poor woman usually wore two gold rings on one of her fingers, and it was said she had saved a little money, which induced this wretch to conceive the design of murdering her, and taking her property. She was a widow, and lived in a humble dwelling with her nephew. One night her nephew came home much intoxicated, and was put to bed. The negro, who was aware of the circumstance, thought this would be a favourable opportunity for executing his bloody design. Accordingly, he climbed up to the top of the house, stripped himself naked, and descended through the chimney to the apartment of the laundress, whom he murdered—not until after a severe struggle, the noise of which awoke her drunken nephew in the adjoining room, who got up and hastened to the rescue of his aunt. In the meantime the villain had cut off the finger with the rings; but before he could escape, he was grappled with by the nephew, who, being a very powerful man, though much intoxicated, very nearly overpowered him; when, by the light of the moon, which shone through the window, he discovered the complexion of the villain, whom (having seldom seen a negro) he took for the devil! The murderer then disengaged himself from the grasp of the nephew, and succeeded in making his escape through the chimney. But the nephew believed, and ever afterwards declared, that it was the devil with whom he had struggled, and who had subsequently flown into the air and disappeared. The negro, in the course of the struggle, had besmeared the young man's shirt in many places with the blood of his victim; and this, joined with other circumstances, induced his neighbours to consider the nephew as the murderer of his aunt. He was arrested, examined, and committed to prison, though he persisted in asserting his innocence, and told his story of the midnight visitor, which appeared not only improbable, but ridiculous in the extreme. He was tried, convicted, and executed, protesting to the last his total ignorance of the murder, and throwing it wholly on his black antagonist, whom he believed to be no other than Satan. The real murderer was not suspected, and returned to America with his little booty; but he, after a wretched existence of ten years, on his deathbed confessed the murder, and related the particulars attending it.—*Boston Mercantile Journal.*

ANECDOTE OF BURKE.

The following affecting incident, detailed by Mrs Burke to a friend, took place a few months before Mr Burke's death in 1797:—'A feeble old horse, which had been a great favourite with the junior Mr Burke, and his constant companion in all rural journeyings and sports, when both were alike healthful and vigorous, was now, in his age, and on the death of his master, turned out to take the run of

the park for the remainder of his life at ease, with strict injunctions to the servants that he should neither be ridden nor molested by any one. While walking one day in solitary musing, Mr Burke perceived this worn-out old servant come close up to him, and at length, after some moments spent in viewing him, followed by seeming recollection and confidence, deliberately rested its head upon his bosom. The singularity of the action itself; the remembrance of his dead son, its late master, who occupied much of his thoughts at all times; and the apparent attachment and almost intelligence of the poor brute, as if it could sympathise with his inward sorrows, rushing at once into his mind, totally overpowered his firmness, and throwing his arms over its neck, he wept long and bitterly.'

LONGING FOR REST.

INTO the woods, into the woods! this fret
And bustle of the big o'er-anxious world
Likes me not: hither, gentle winds, and let
Your blue and rustling pinions be unfurled
To bear my vexed spirit far away
Into the bosom of yon dusk old wood,
Winding as the valley winds for many a rood:
Westward the burning chariot-wheel of day
Is in the chrome-dyed ocean axle-deep;
Haste, ere the twinkling dew o'er the green earth shall creep!

'Tis featly done. Oh now at length repose
Shall find me, here, where nothing is that breathes
The spirit of unrest. How richly those
Rays that come streaming where the king-oak wreathes
His warped and gnarled boughs, make the moss floor
Of this vast temple seem mosaic-wrought;
Each knoll's an altar whence ascends untaught
The willing incense of the flowers, that more
Than all mute things on earth their homage pay
To the dear love that keeps their fair forms day by day!

Here would I worship too, listening the note
That ripples out upon the stirless air,
In sweet wild gushes from the ruffled throat—
Of some winged minstrel: how that music rare
Brimfills my sense with stillest quietude!
Alack, 'tis past, and silence and repose
Reign in twin sisterhood: yon meek wild rose
Her silken leaves, with softest tints imbued,
Hath folded in the shade, and now appears
When wet with dew more sweet, like Innocence in tears.

Dear dreamy wood! Ha! the small aspen leaves
Are quivering in a white and misty beam;
In the deep-shadowed foliage it weaves
A silver-tinselled tissue, that doth seem
Meet for the bridal robing of the fay
That queens it in this forest; upward see
The clustered stars that glitter wittingly,
That shed o'er many a lone ship's ocean way
Their soft dispassioned lustre: oft when care
Hath fevered and harassed, I've blest their radiance fair.

I would not wish a sweeter home than this,
Since man his brother still will vex for nought;
Even here, where rival flowers entwining kiss,
And all things yield their beauty, Heaven-taught,
To bless each other. Tremulously faint
Gleams by the river brink yon glow-worm's lamp,
Where now he banquets him on rank weeds damp
With beaded dew; while, simply sad and quaint,
Night-winds a low and dirge-like cadence bring
Where cloistered in dim shade the owl sits sorrowing.

Oh sure there is a wordless eloquence
Breathed freely forth within these leafy glooms,
The odour which all verdurous things dispense,
The birds soft nestled in the drooping plumes
Of the all-muffling ivy, and the clear
Unhindered glory of the moon, that makes
A glittering heaven of dew-stars in the brakes,
Whisper my sorrow-burthened heart that here
For every wo there is a gracious balm,
For all its o'erwrought fears a hushed and holy calm.—ZETA.

PRICE 1½d.

HEADS, HEARTS, AND HANDICRAFTS.

[BY ONE LATELY A HANDWORKER.]

I HAVE frequently thought that working-men in general do not take a proper view of their position as co-workers in a progressive state of society; and it might not be unprofitable to inquire as to how far certain allegations concerning them are tenable—namely, that they have no real pleasures—no command of elevating resources—and that their position is of necessity one of depressing and hopeless toil. I have already been favoured with an opportunity of recording some of my experiences in connection with the subject (*Journal*, No. 244), and recur to it now in the hope that a few additional observations, based also on personal experience, may prove acceptable, particularly to the great body of artificers with which I was, until within a few years past, intimately associated.

The wearer of a shoe, it is said, best knows where it pinches; but from all I have seen, I doubt whether working-men (exceptions apart) are the best judges of their own circumstances: a defect whose origin may be traced to several causes, the principal being, a certain traditional influence of custom circumscribing their moral horizon within very narrow limits, and comprising—perhaps the whole evil—an unconsciousness of latent power. If fashion dominates the high, custom no less sways the humble; and being 'to the manner born' is mistakingly with the latter a paramount reason for never being otherwise. Take, for example, the convivial drinking usages, most honoured by those least able to afford the expense—the reluctance to adopt improvements in domestic economy, markedly evinced in the tenacity with which they cling to wretched residences even when better are to be had—and in the species of fatalism with which they look upon themselves as shut up in an inexpansive groove, the last being perhaps a cause of the ridicule not unfrequently inflicted on such of their co-mates as manifest a disposition to improve their circumstances.

It would not be fair to impute unmitigated blame for such a state of things, since blame must attach chiefly to wilful error; and we know that among the thousands of British handworkers there are many noble examples of manful resistance to adverse circumstances, of brave self-reliance and successful perseverance. Would that there were more such! that this were a triumphal ode, and not a didactic essay! But though ignorance of what is right may be pleaded in extenuation, this will only avail to a limited extent; for the reply might be—Have you ever made an effort to remove your ignorance? Have you ever once seriously thought about the end of all this scramble for existence?

Now don't be alarmed, for I am not going to inflict a sermon on you: my desire is simply to convey a few leading principles which experience has taught me are the mainstays of individual progress, and to illustrate a

few errors which are obviously inimical to advancement. I have said above that an important defect consists in working-men's unconsciousness of latent or undeveloped power within themselves. You are almost, if not quite, at the bottom of the social scale (conventionally speaking); and so, thinking that matters cannot well be worse, you are content, in nine cases out of ten, to let them take their chance. Your existence seems uncertain; and therefore you trifle with its opportunities, or squander its impulses in mischief. A case or two in point occurs to me. An excellent individual, who keeps a mill on one of our inland streams, had been accustomed to present each of the men in his employ with a shoulder of mutton at Christmas, a quantity of vegetables, and materials for a pudding. But how was this attempt to gladden labour's scanty board received?—with apathy or worse. It was regarded as a bribe for general service, not as an expression of sympathy with subordinate co-operation. By and by the apparent mystery was cleared up, by the discovery of a nefarious system of plunder that prevailed in the mill. Again: at the building of a house in a London suburban thoroughfare, the bricklayers fancied themselves aggrieved in the quality or quantity of the beer supplied to them by the owner of the property, and to revenge themselves, they placed a board over the mouth of the drain, at its junction with the sewer, so as to close it up effectually, and stopped the vent of three of the chimneys. The consequence was, that the first tenant was nearly poisoned by a stagnant drain, and suffocated by smoke; and after all, the expense of remedying the mischief did not fall upon the party whom it was intended to punish. An additional instance offers itself in the case of a journeyman cabinet-maker whom I once knew: he was animated by a desire to better his position, and opened a school for drawing and singing in the evenings; but these endeavours, instead of meeting with encouragement from his shopmates, only provoked their ridicule. They seized every opportunity of annoyance; and having discovered that the nickname 'Shot-bag' was once extant among their comrade's family connections, they immediately applied it to him, and worried him so unmercifully, that his life became a misery: he was compelled to keep as much as possible out of their sight, and made his way in and out of the workshop through a back window.

There are many intelligent working-men who will deplore these instances of perverse principle, this flagrant misdirection of purpose. But I would remind those whose views are yet imperfect, that such violations of the law of justice and kindness are more harmful to the injurer than to the injured. Prosperity does not consist in detraction, but in aspiration; if we wish to rise, we must look upwards. The social pyramid is not kept erect by adventitious embellishments at the apex, but by the addition of sterling material to the base. Here, then, is a prime motive for us to start with: by bettering

ourselves, we better all that is above us. It is a grand thought for one who has hitherto considered himself as of no account in the sum-total of society, to know that his efforts, whether for good or for evil, react on the common weal. Here we have the first step upwards; a little fund to put out to interest; and good interest it brings—cent. per cent. at least. The power to see a purpose in life, a significance in our actions, is thus one of essential importance. We cannot, if we would, divest ourselves of the manifold and often secret ties by which humanity is bound together.

Let us now look for a moment at the ordinary position of the working-man. Early compelled by the primeval necessity to labour, he masters some art or operation; and after this his life goes on in a monotonous mechanical routine, involving but little incident, and varied in too many instances only by blame from his employer. And herein lies a cause of discontent; for we too often find that, although accident or error is visited with blame, the commendation due to well-meant effort is withheld. The money wage is made to take the place of the touch of nature, of the word of sympathy, oftentimes more highly esteemed than the golden fee. Masters, too, will be capricious; and not unfrequently the poor *employé* becomes the *pièce de résistance* of all his vexations and irritations. Such a liability tends naturally to diminish a man's self-respect, and aggravate the desponding feeling with which the handworker is apt to contemplate his prospects, and which I have felt more than once in all its bitterness: with nothing more than a small weekly income depending entirely on your own ability to earn it, your hold upon the world seems to be so feeble, so precarious. Such a feeling could not exist were proper means taken to lay up a sum in the savings' bank, or to purchase a small endowment. But how often did the thought overcloud my mind—let me be out of health for a month, and beggary awaits me: the apprehension was at times unnerving. You despair of ever obtaining a secure foothold, of getting your plank fairly across the stream, and are ready to sink into recklessness. I remember another source of annoyance—it was having to wait for payment on Saturday. Our custom was to have our tools put away, and benches swept down, &c. by six o'clock in the evening of that day, at which hour the master sometimes made his appearance with our wages; but frequently we were kept waiting till seven, eight, or nine o'clock, growing every moment more impatient and more angry, before the cash-bearer made his appearance. Thus we lost both time and temper, and were prevented from going to market until a late hour; the more provoking as, having fulfilled our week, we considered ourselves fairly entitled to prompt payment. I adduce these facts because they are such as are still common, and in the hope to convince masters that the humanising and elevating of their workmen involves a reciprocity of duties. Good may be done with but small means; every factory and workshop might become a centre of most beneficial influences, with but a small sacrifice of selfishness; and the combined action of so many effusive centres would produce an amount of good beyond present calculation.

The above, it may be said, is not a very flattering picture of a working-man's condition; but there is no question as to its truth; and I hope to show that even thus it is not devoid of compensations. A small income does not necessarily involve a corroding anxiety; we must learn rather to extract the best even from the worst of circumstances; and in doing this, we are not, as is sometimes feared, predestinating ourselves to the lowest level, but, on the contrary, best acquiring the ability to rise—

conquering one of the rudiments of self-reliance. The wealthy merchant or banker is obliged to exercise his thoughts and talent severely in order to administrate his income profitably; and why should not the working-man be willing to devote a little thought to the same subject? First, a portion of the weekly earnings should be set apart for rent; a second for food, washing, clothes, and other household requisites; a third for schooling; and a fourth for the savings' bank. Now, as much wisdom comparatively may be shown in regulating this humble expenditure as in that of the richest financier. The greatest outlay will occur under the second of the above items, and will require most looking after; and here we have to conquer another instalment of self-reliance. Having sat down and calculated that we can keep house for so much, we must perseveringly adhere to this limit; no matter what the temptations to overstep it, we must show them the cold shoulder. It may be, and is, hard work to follow such a course; but

—'Fruit soon comes,
And more than all our troubles pays us powers;
So that we joy to have endured so much.'

The reward is certain; and oh how sweet! What a world of care and anxiety disappears as soon as a man, by diligence and thrift, has a small fund in the savings' bank! The snubbings and collisions encountered in daily avocation suddenly lose their asperity; self-confidence, with something to back it, not only gives a man a sense of self-respect, but renders him more valuable to his employer. At first the new-born energy is a source of astonishment: the novice wonders to find greater force and precision in the stroke of his mallet, and increased vigour in the bite of his saw.

This, which I would call a rudimentary compensation, yields an encouraging assurance; but there are others yet before us, and chief among them is the acquisition of knowledge. Books are so cheap in the present day, as to afford unlimited resources to all for the improvement of their minds; and it is a fact, that the more knowledge a man gets, all other things being equal, the better workman will he be. Mr Chadwick rates the value of a labourer at £30; at how much more shall we estimate the worth of an intelligent artisan, who has not only added to his command of pleasures, but enlarged his resources against casualty! Manual dexterity, when directed by thoughtful intelligence, becomes a constant source of pleasure. Often, when wearied with work, I have found myself invigorated by watching, so to speak, the object on which I was engaged: how beautifully the hand obeyed the thought—how, from a rough mass of boards and planks, the sideboard or *secrétaire* grew up in harmonious proportions! I have often been struck with Channing's observations on this subject:—'It is,' he says, 'one of the beautiful ordinations of Providence, that to get a living, a man must be useful; and this usefulness ought to be an end in his labour as truly as to earn his living. He ought to think of the benefit of those he works for, as well as of his own; and in so doing—in desiring, amidst his sweat and toil, to serve others as well as himself, he is exercising and growing in benevolence, as truly as if he were distributing bounty with a large hand to the poor. Such a motive hallows and dignifies the commonest pursuit.... One would think that a carpenter or mason, on passing a house which he had reared, would say to himself, "This work of mine is giving comfort and enjoyment every day and hour to a family, and will continue to be a kindly shelter, a domestic gathering-place, an abode of affection, for a century or more after I sleep in the dust:" and ought not a generous satisfaction to spring up at the thought? It

is by thus interweaving goodness with common labours that we give it strength, and make it a habit of the soul.'

Here are noble compensations; and the sameness so often complained of in the working-man's life enables him to draw largely upon them. To cultivate the quiet domestic virtues, while plying the instruments of labour, the mind may be occupied with thoughts of the home circle, its chastening griefs and elevating joys. It may revisit and roam at large in fields and lanes, or the voice may attune itself to the melodies of sound; and a weary hour may often be beguiled by recollection of all that the worker knows of the materials—their history and manipulation—on which he is employed.

Thus a man need not be ignorant or debased because he is compelled to work for his living. With such resources and recreations at command, there is no valid reason why his life should not be one of progress. But this, you may be apt to say, is too much trouble. But 'all aspiration is a toil;' and were it not for the struggle, you would never become aware of the slumbering powers within you; if everything came smooth and ready to our hands, we should soon relapse into a stagnant demoralisation. We must remember that passions are given us as stimuli, and duty is the bridle with which these passions are kept in due subservience, in efficient working order. Society owes duties to us, and we owe duties to society. We are apt to accuse society of defrauding us of our due proportion; but is not this a touch of tradition—a taint of the ancient serfdom still clinging to us? What is the remedy?—to prove our right by proving our desert. Here is a lofty compensation: we may each say—I will conquer for myself an improving position, by such conduct and moral discipline as must overcome. Even the passive force of such a determination would be resistless; and bewailings about social injustice would subside into an echo.

Reflect for a moment: there are about 4,000,000 men of different ages in this country who depend on manual labour of some sort for their means of living. What if the legions of this industrial army were animated by the 'mounting spirit,' by the might of self-reliance? Society would have begun its noblest crusade against ignorance and its attendant evils; for the incubus of pauperism would disappear, knowledge would gladden and humanise our land, and 'Unions' be converted into universities of industry.

Am I anticipating too much? Let the numerous examples of what *has* and *can* be done suffice for reply. We want something beyond the mere instinct of the ant and bee, and the attainment of this lies open to each one of us. It is cheering to know that many a man plodding at the work-bench originates and revolves thoughts in his mind that would do honour to the proudest philosopher—that the fire of a lofty and earnest purpose glows in many a humble dwelling. There wants but the will; and marvellous are the effects that result from small beginnings. The fifteen or twenty cotton-spinners whom I once knew meeting week after week in a village near Stockport to study French and mathematics, I will venture to say have gone on adding to their knowledge, and experienced its elevating influences in all their social relations; proving that it costs less in conscience, as well as coin, to obtain the amenities of life than to obey its animal propensities.

Difficulty, if we would but so consider it, is only the wave's deepened hollow, from which we may rise to a higher summit. We are so prone to take things easy, that an intimation to brace up our energies is from time to time necessary. The life most devoid of incident will afford reminiscences of such opportunities. Many years ago, under an unpropitious combination of circumstances, at the commencement of a dreary winter, I walked from the interior of the state to the city of New York in search of work. I had but two or three cents left on my arrival, and while searching for employment, was dependent for subsistence on the kindness of a friend. How depressing is the want of occupation! I was glad at times

to step into a book auction to divert my feelings. One evening a second-hand lot was put up—'Raynal's Histoire des Deux Indes,' in seventeen volumes: no one spoke. 'Going for the price of waste paper!' said the auctioneer. I took him at his word, and bid a shilling (7d. sterling), which I happened to have in my pocket. Down went the hammer, and a general laugh went round as I took the books under my arm and walked away. By and by I found work: the 'boss' gave me leave to sleep with his apprentice in the attic; I got my meals at a cheap boarding-house, and thus lived economically. And not without reason; for besides providing for current expenses, it was essential to retrieve the lost time. I worked from daylight in the morning until ten at night; kept my family in comfort, where I had left them in the country; and at the end of four months, found that my savings amounted to thirty dollars, a sum which enabled me to open a new career of prosperity. But I must not forget the books: every workman knows that there are times when he has to wait for materials, or for a new job. On such occasions 'Raynal's Histoire' proved a valuable and instructive resource, and furnished me with food for thought. 'Vat an inquisitive Englishman!' often cried a Frenchman, whose bench was next to mine, as I sat reading on a 'saw buck'; and the boss would say—'Ah, you'll never get on while you're so fond of books.' But when he found that I was as fresh and ready for work on Mondays as on other mornings, he ceased to rebuke my inclinations.

Since that time another reverse threw me into a country village in England, pinched by penury, and lacking everything but the will to make the best of whatever happened. After a time a situation was offered me at a music-publisher's in London: it was out of my line, but I started at once, leaving my family in their rural cottage. The place of business was in the Strand; my hours of work were from seven in the morning till eight at night; wages thirty shillings a week, for which I did duty as Jack-of-all-trades: serving in the shop—keeping stock-book and petty cash-account—giving out work to book-binders, watching printers, correcting proofs, and so forth. Here, again, past losses were to be retrieved: I bought every morning a threepenny brown loaf, and divided it into three portions. One of these, with a cup of coffee, was my breakfast; the second, with a little salt or an apple, formed my dinner; and the third, with a glass of water or cup of tea, was my supper. My bed was in a little book-room in the fifth storey: I rose at six in the morning, and made myself acquainted with the topography of the neighbourhood, and saw some of the aspects of London which can only be seen at an early hour. One evening in the week I went after eight to a singing-class; on another I walked to Islington, where a kind friend gave me lessons in Greek and German; and for the rest I had plenty of books at command. Sometimes I had to sit up late to receive proofs from the printer, and on one occasion found it necessary to go to his office near Temple Bar after midnight. Our establishment was then on the eve of being given up, and I was expressing my apprehensions about obtaining another situation to the master-printer as we stood together at his desk. I shall never forget his reply—'Never you fear,' he said, patting me on the back; 'I have watched you long enough to know that you can do your duty for others as well as for yourself: such as you are sure to do.' The hopes which then began to inspire me as I walked back through the solitary street have been more than realised.

Now for the conclusion. Let every man do his best, and in some shape or other the reward of the best will certainly come to him. Let him cultivate a spirit of hopefulness: if things do not *come* round according to his notion, let him *put* them round; and if even then not quite palatable, don't give up the struggle, and take to listlessness and dissipation. You can mould inert matter to your will; strive for the master-hand over yourself. Every man's house is his castle. See that yours be not a Doubting Castle, with Giant Despair for its occupant. Do not curse God and die!

The chiefest reward of a writer is the hope or the certainty that his writings may be useful. What say you,

fellow-workmen? May I entertain this hope? May I anticipate this reward for my humble attempt to show that without the concurrence of HEAD and HEART, there can be no *real* profit in HANDICRAFT?

EXPERIENCES OF A BARRISTER.

THE MOTHER AND SON.

DINNER had been over about half an hour one Sunday afternoon—the only day on which for years I had been able to enjoy a dinner—and I was leisurely sipping a glass of wine, when a carriage drove rapidly up to the door, a loud *rat-tat* followed, and my friend Dr Curteis, to my great surprise, was announced.

‘I have called,’ said the doctor as we shook hands, ‘to ask you to accompany me to Mount Place. I have just received a hurried note from Miss Armitage, stating that her mother, after a very brief illness, is rapidly sinking, and requesting my attendance, as well as that of a legal gentleman, immediately.’

‘Mrs Armitage!’ I exclaimed, inexpressibly shocked. ‘Why, it is scarcely more than a fortnight ago that I met her at the Rochfords’ in brilliant health and spirits.’

‘Even so. But will you accompany me? I don’t know where to find any one else for the moment, and time presses.’

‘It is an attorney, probably, rather than a barrister, that is needed; but under the circumstances, and knowing her as I do, I cannot hesitate.’

We were soon bowling along at a rapid pace, and in little more than an hour reached the dying lady’s residence, situated in the county of Essex, and distant about ten miles from London. We entered together; and Dr Curteis, leaving me in the library, proceeded at once to the sick chamber. About ten minutes afterwards the housekeeper, a tall, foreign-looking, and rather handsome woman, came into the room, and announced that the doctor wished to see me. She was deadly pale, and, I observed, trembled like an aspen. I motioned her to precede me; and she, with unsteady steps, immediately led the way. So great was her agitation, that twice, in ascending the stairs, she only saved herself from falling by grasping the banister-rail. The presage I drew from the exhibition of such overpowering emotion, by a person whom I knew to have been long not only in the service, but in the confidence of Mrs Armitage, was soon confirmed by Dr Curteis, whom we met coming out of the chamber of the expiring patient.

‘Step this way,’ said he, addressing me, and leading to an adjoining apartment. ‘We do not require your attendance, Mrs Bourdon,’ said he, as soon as we reached it, to the housekeeper, who had swiftly followed us, and now stood staring with eager eyes in the doctor’s face, as if life and death hung on his lips. ‘Have the goodness to leave us,’ he added tartly, perceiving she did not stir, but continued her fearful, scrutinising glance. She started at his altered tone, flushed crimson, then paled to a chalky whiteness, and muttering, left the apartment.

‘The danger of her mistress has bewildered her,’ I remarked.

‘Perhaps so,’ remarked Dr Curteis. ‘Be that as it may, Mrs Armitage is beyond all human help. In another hour she will be, as we say, no more.’

‘I feared so. What is the nature of her disorder?’

‘A rapid wasting away, as I am informed. The appearances presented are those of a person expiring of atrophy, or extreme emaciation.’

‘Indeed. And so sudden too!’

‘Yes. I am glad you are come, although your professional services will not, it seems, be required—a neighbouring attorney having performed the necessary duty—something, I believe, relative to the will of the dying lady. We will speak further together by and by. In the meantime,’ continued Dr Curteis, with a perceptible tremor in his voice, ‘it will do neither of us any harm to witness the closing scene of the life of Mary Rawdon, whom you and I twenty years ago worshipped as one of the gentlest and most beautiful of beings with which the Creator ever graced his universe. It will be a peaceful parting. Come.’

Just as, with noiseless footsteps, we entered the silent death-chamber, the last rays of the setting sun were falling upon the figure of Ellen Armitage—who knelt in speechless agony by the bedside of her expiring parent—and faintly lighting up the pale, emaciated, sunken features of the so lately brilliant, courted Mrs Armitage! But for the ineffaceable splendour of her deep-blue eyes, I should scarcely have recognised her. Standing in the shadow, as thrown by the heavy bed-drapery, we gazed and listened unperceived.

‘Ellen,’ murmured the dying lady, ‘come nearer to me. It is growing dark, and I cannot see you plainly. Now, then, read to me, beginning at the verse you finished with as good Dr Curteis entered. Ay,’ she faintly whispered, ‘it is thus, Ellen, with thy hand clasped in mine, and with the words of the holy book sounding from thy dear lips, that I would pass away!’

Ellen, interrupted only by her blinding tears, making sad stops, complied. Twilight stole on, and threw its shadow over the solemn scene, deepening its holiness of sorrow. Night came with all her train; and the silver radiance kissed into ethereal beauty the pale face of the weeping girl, still pursuing her sad and sacred task. We hesitated to disturb, by the slightest movement, the repose of a deathbed over which belief and hope, those only potent ministers, shed light and calm! At length Dr Curteis advanced gently towards the bed, and taking the daughter’s hand, said in a low voice, ‘Had you not better retire, my dear young lady, for a few moments?’ She understood him, and rising from her knees, threw herself in an ecstasy of grief upon the corpse, from which the spirit had just passed away. Assistance was summoned, and the sobbing girl was borne from the chamber.

I descended, full of emotion, to the library, where Dr Curteis promised shortly to join me. Noiselessly entering the room, I came suddenly upon the housekeeper and a tall young man, standing with their backs towards me in the recesses of one of the windows, and partly shrouded by the heavy cloth curtains. They were evidently in earnest conference, and several words, the significance of which did not at the moment strike me, reached my ears before they perceived my approach. The instant they did so, they turned hastily round, and eyed me with an expression of flurried alarm, which at the time surprised me not a little. ‘All is over, Mrs Bourdon,’ said I, finding she did not speak; ‘and your presence is probably needed by Miss Armitage.’ A flash of intelligence, as I spoke, passed between the pair; but whether indicative of grief or joy, so momentary was the glance, I should have been puzzled to determine. The housekeeper immediately left the room, keeping her eyes, as she passed, fixed upon me with the same nervous apprehensive look which had before irritated Dr Curteis. The young man followed more slowly. He was a tall and rather handsome youth, apparently about one or two-and-twenty years of age. His hair was black as jet, and his dark eyes were of singular brilliancy; but the expression, I thought, was scarcely a refined or highly-intellectual one. His resemblance to Mrs Bourdon, whose son indeed he was, was very striking. He bowed slightly, but courteously, as to an equal, as he closed the door, and I was left to the undisturbed enjoyment of my own reflections, which, ill-defined and indistinct as they were, were anything but pleasant company. My reverie was at length inter-

rupted by the entrance of the doctor, with the announcement that the carriage was in waiting to re-convey us to town.

We had journeyed several miles on our return before a word was spoken by either of us. My companion was apparently even more painfully preoccupied than myself. He was, however, the first to break silence. 'The emaciated corpse we have just left little resembles the gay beautiful girl for whose smiles you and I were once disposed to shoot each other!' The doctor's voice trembled with emotion, and his face, I perceived, was pale as marble.

'Mary Rawdon,' I remarked, 'lives again in her daughter.'

'Yes; her very image. Do you know,' continued he, speaking with rapid energy, 'I suspect Mary Rawdon—Mrs Armitage, I would say—has been foully, treacherously dealt with!'

I started with amazement; and yet the announcement but embodied and gave form and colour to my own ill-defined and shadowy suspicions.

'Good heavens! How? By whom?'

'Unless I am greatly mistaken, she has been poisoned by an adept in the use of such destructive agents.'

'Mrs Bourdon?'

'No; by her son. At least my suspicions point that way. She is probably cognisant of the crime. But in order that you should understand the grounds upon which my conjectures are principally founded, I must enter into a short explanation. Mrs Bourdon, a woman of Spanish extraction, and who formerly occupied a much higher position than she does now, has lived with Mrs Armitage from the period of her husband's death, now about sixteen years ago. Mrs Bourdon has a son, a tall, good-looking fellow enough, whom you may have seen.'

'He was with his mother in the library as I entered it after leaving you.'

'Ah! Well, hem! This boy, in his mother's opinion—but that perhaps is somewhat excusable—exhibited early indications of having been born a "genius." Mrs Armitage, who had been first struck by the beauty of the child, gradually acquired the same notion; and the result was, that he was little by little invested—with at least her tacit approval—with the privileges supposed to be the lawful inheritance of such gifted spirits; namely, the right to be as idle as he pleased—geniuses, you know, can, according to the popular notion, attain any conceivable amount of knowledge *per saltum* at a bound—and to exalt himself in the stilts of his own conceit above the useful and honourable pursuits suited to the station in life in which Providence had cast his lot. The fruit of such training soon showed itself. Young Bourdon grew up a conceited and essentially-ignorant puppy, capable of nothing but bad verses, and thoroughly impressed with but one important fact, which was, that he, Alfred Bourdon, was the most gifted and the most ill-used of all God's creatures. To genius, in any intelligible sense of the term, he has in truth no pretension. He is endowed, however, with a kind of reflective talent, which is often mistaken by fools for creative power. The morbid fancies and melancholy scorn of a Byron, for instance, such gentry reflect back from their foggy imaginations in exaggerated and distorted feebleness of whining verses, and so on with other lights celestial or infernal. This, however, by the way. The only rational pursuit he ever followed, and that only by fits and starts, and to gratify his faculty of "wonder," I fancy, was chemistry. A small laboratory was fitted up for him in the little summer-house you may have observed at the further corner of the lawn. This study of his, if study such desultory snatches at science may be called, led him, in his examination of vegetable bodies, to a smattering acquaintance with botany, a science of which Ellen Armitage is an enthusiastic student. They were foolishly permitted to *botanise* together, and the result was, that Alfred Bourdon, acting upon the principle

that genius—whether sham or real—levels all merely mundane distinctions, had the impudence to aspire to the hand of Miss Armitage. His passion, sincere or simulated, has never been, I have reason to know, in the slightest degree reciprocated by its object; but so blind is vanity, that when, about six weeks ago, an *éclaircissement* took place, and the fellow's dream was somewhat rudely dissipated, the untoward rejection of his preposterous suit was, there is every reason to believe, attributed by both mother and son to the repugnance of Mrs Armitage alone; and to this idiotic hallucination she has, I fear, fallen a sacrifice. Judging from the emaciated appearance of the body, and other phenomena communicated to me by her ordinary medical attendant—a blundering ignoramus, who ought to have called in assistance long before—she has been poisoned with *iodine*, which, administered in certain quantities, would produce precisely the same symptoms. Happily there is no mode of destroying human life which so surely leads to the detection of the murderer as the use of such agents; and of this truth the *post mortem* examination of the body, which takes place to-morrow morning, will, if I am not grossly mistaken, supply another vivid illustration. . . . Legal assistance will no doubt be necessary, and I am sure I do not err in expecting that *you* will aid me in bringing to justice the murderer of Mary Rawdon?'

A pressure of his hand was my only answer. 'I shall call for you at ten o'clock,' said he, as he put me down at my own door. I bowed, and the carriage drove off.

'Well?' said I, as Dr Curteis and Mr — the eminent surgeon entered the library at Mount Place the following morning after a long absence.

'As I anticipated,' replied the doctor with a choking voice: 'she has been poisoned!'

I started to my feet. 'And the murderer?'

'Our suspicions still point to young Bourdon; but the persons of both mother and son have been secured.'

'Apart?'

'Yes; and I have despatched a servant to request the presence of a neighbour—a county magistrate. I expect him momentarily.'

After a brief consultation, we all three directed our steps to the summer-house which contained young Bourdon's laboratory. In the room itself nothing of importance was discovered; but in an enclosed recess, which we broke open, we found a curiously-fashioned glass bottle half full of iodine.

'This is it!' said Mr —; 'and in a powdered state too—just ready for mixing with brandy or any other available dissolvent.' The powder had somewhat the appearance of fine black-lead. Nothing further of any consequence being observed, we returned to the house, where the magistrate had already arrived.

Alfred Bourdon was first brought in; and he having been duly cautioned that he was not obliged to answer any question, and that what he did say would be taken down, and, if necessary, used against him, I proposed the following questions:—

'Have you the key of your laboratory?'

'No; the door is always open.'

'Well, then, of any door or cupboard in the room?'

At this question his face flushed purple: he stammered, 'There is no'—and abruptly paused.

'Do I understand you to say there is no cupboard or place of concealment in the room?'

'No: here is the key.'

'Has any one had access to the cupboard or recess of which this is the key, except yourself?'

The young man shook as if smitten with ague: his lips chattered, but no articulate sound escaped them.

'You need not answer the question,' said the magistrate, 'unless you choose to do so. I again warn you that all you say will, if necessary, be used against you.'

'No one,' he at length gasped, mastering his hesitation by a strong exertion of the will—'no one can

have had access to the place but myself. I have never parted with the key.'

Mrs Bourdon was now called in. After interchanging a glance of intense agony, and, as it seemed to me, of affectionate intelligence with her son, she calmly answered the questions put to her. They were unimportant, except the last, and that acted upon her like a galvanic shock. It was this—'Did you ever struggle with your son on the landing leading to the bedroom of the deceased for the possession of this bottle?' and I held up that which we had found in the recess.

A slight scream escaped her lips; and then she stood rigid, erect, motionless, glaring alternately at me and at the fatal bottle with eyes that seemed starting from their sockets. I glanced towards the son; he was also affected in a terrible manner. His knees smote each other, and a clammy perspiration burst forth and settled upon his pallid forehead.

'Again I caution you,' iterated the magistrate, 'that you are not bound to answer any of these questions.'

The woman's lips moved. 'No—never!' she almost inaudibly gasped, and fell senseless on the floor.

As soon as she was removed, Jane Withers was called. She deposed that three days previously, as she was, just before dusk, arranging some linen in a room a few yards distant from the bedroom of her late mistress, she was surprised at hearing a noise just outside the door, as of persons struggling and speaking in low but earnest tones. She drew aside a corner of the muslin curtain of the window which looked upon the passage or corridor, and there saw Mrs Bourdon striving to wrest something from her son's hand. She heard Mrs Bourdon say, 'You shall not do it, or you shall not have it—she could not be sure which. A noise of some sort seemed to alarm them: they ceased struggling, and listened attentively for a few seconds: then Alfred Bourdon stole off on tip-toe, leaving the object in dispute, which witness could not see distinctly, in his mother's hand. Mrs Bourdon continued to listen, and presently Miss Armitage, opening the door of her mother's chamber, called her by name. She immediately placed what was in her hand on the marble top of a side-table standing in the corridor, and hastened to Miss Armitage. Witness left the room she had been in a few minutes afterwards, and, curious to know what Mrs Bourdon and her son had been struggling for, went to the table to look at it. It was an oddly-shaped glass bottle, containing a good deal of a blackish-gray powder, which, as she held it up to the light, looked like black-lead.'

'Would you be able to swear to the bottle if you saw it?'

'Certainly I should.'

'By what mark or token?'

'The name of Valpy or Vulpy was cast into it—that is, the name was in the glass itself.'

'Is this it?'

'It is: I swear most positively.'

A letter was also read which had been taken from Bourdon's pocket. It was much creased, and was proved to be in the handwriting of Mrs Armitage. It consisted of a severe rebuke at the young man's presumption in seeking to address himself to her daughter, which insolent ingratitude, the writer said, she should never, whilst she lived, either forget or forgive. This last sentence was strongly underlined in a different ink from that used by the writer of the letter.

The surgeon deposed to the cause of death. It had been brought on by the action of iodine, which, administered in certain quantities, produced symptoms as of rapid atrophy, such as had appeared in Mrs Armitage. The glass bottle found in the recess contained iodine in a pulverised state.

I deposed that, on entering the library on the previous evening, I overheard young Mr Bourdon, addressing his mother, say, 'Now that it is done past recall, I will not shrink from any consequences, be they what they may!'

This was the substance of the evidence adduced; and the magistrate at once committed Alfred Bourdon to Chelmsford jail, to take his trial at the next assize for 'wilful murder.' A coroner's inquisition a few days after also returned a verdict of 'wilful murder' against him on the same evidence.

About an hour after his committal, and just previous to the arrival of the vehicle which was to convey him to the county prison, Alfred Bourdon requested an interview with me. I very reluctantly consented; but steeled as I was against him, I could not avoid feeling dreadfully shocked at the change which so brief an interval had wrought upon him. It had done the work of years. Despair—black, utter despair—was written in every lineament of his expressive countenance.

'I have requested to see you,' said the unhappy culprit, 'rather than Dr Curteis, because he, I know, is bitterly prejudiced against me. But you will not refuse, I think, the solemn request of a dying man—for a dying man I feel myself to be—however long or short the interval which stands between me and the scaffold. It is not with a childish hope that any assertion of mine can avail before the tribunal of the law against the evidence adduced this day, that I, with all the solemnity befitting a man whose days are numbered, declare to you that I am wholly innocent of the crime laid to my charge. I have no such expectation; I seek only that you, in pity of my youth and untimely fate, should convey to her whom I have madly presumed to worship this message: "Alfred Bourdon was mad, but not blood-guilty; and of the crime laid to his charge he is innocent as an unborn child."'

'The pure and holy passion, young man,' said I, somewhat startled by his impressive manner, 'however presumptuous, as far as social considerations are concerned, it might be, by which you affect to be inspired, is utterly inconsistent with the cruel, dastardly crime of which such damning evidence has an hour since been given'—

'Say no more, sir,' interrupted Bourdon, sinking back in his seat, and burying his face in his hands: 'it were a bootless errand; she could not, in the face of that evidence, believe my unsupported assertion! It were as well perhaps she did not. And yet, sir, it is hard to be trampled into a felon's grave, loaded with the maledictions of those whom you would coin your heart to serve and bless! Ah, sir,' he continued, whilst tears of agony streamed through his firmly-closed fingers, 'you cannot conceive the unutterable bitterness of the pang which rends the heart of him who feels that he is not only despised, but loathed, hated, execrated, by her whom his soul idolises! Mine was no boyish, transient passion: it has grown with my growth, and strengthened with my strength. My life has been but one long dream of her. All that my soul had drunk in of beauty in the visible earth and heavens—the light of setting suns—the radiance of the silver stars—the breath of summer flowers, together with all which we imagine of celestial purity and grace, seemed to me in her incarnated, concentrated, and combined! And now lost—lost—for ever lost!' The violence of his emotions choked his utterance; and deeply and painfully affected, I hastened from his presence.

Time sped as ever onwards, surely, silently; and justice, with her feet of lead, but hands of iron, closed gradually upon her quarry. Alfred Bourdon was arraigned before a jury of his countrymen, to answer finally to the accusation of wilful murder preferred against him.

The evidence, as given before the committing magistrate, and the coroner's inquisition, was repeated with some addition of passionate expressions used by the prisoner indicative of a desire to be avenged on the deceased. The cross-examination by the counsel for the defence was able, but failed to shake the case for the prosecution. His own admission, that no one but himself had access to the recess where the poison was found, told fatally against him. When called upon to address

the jury, he delivered himself of a speech rather than a defence; of an oratorical effusion, instead of a vigorous, and, if possible, damaging commentary upon the evidence arrayed against him. It was a laboured, and in part eloquent, exposition of the necessary fallibility of human judgment, illustrated by numerous examples of erroneous verdicts. His peroration I jotted down at the time:—'Thus, my lord and gentlemen of the jury, is it abundantly manifest, not only by these examples, but by the testimony which every man bears in his own breast, that God could not have willed, could not have commanded, his creatures to perform a pretended duty, which he vouchsafed them no power to perform righteously. Oh, be sure that if he had intended, if he had commanded you to pronounce irreversible decrees upon your fellow-man, quenching that life which is his highest gift, he would have endowed you with gifts to perform that duty rightly! Has he done so? Ask not alone the pages dripping with innocent blood which I have quoted, but your own hearts! Are you, according to the promise of the serpent-tempter, "gods, knowing good from evil?" of such clear omniscience, that you can hurl an unprepared soul before the tribunal of its Maker, in the full assurance that you have rightly loosed the silver cord which he had measured, have justly broken the golden bowl which he had fashioned! Oh, my lord,' he concluded, his dark eyes flashing with excitement, 'it is possible that the first announcement of my innocence of this crime, to which you will give credence, may be proclaimed from the awful tribunal of him who alone cannot err! How if he, whose eye is even now upon us, should then proclaim, "I, too, sat in judgment on the day when you presumed to doom your fellow-worm; and I saw that the murderer was not in the dock, but on the bench!" Oh, my lord, think well of what you do—pause ere you incur such fearful hazard; for be assured, that for all these things God will also bring you to judgment!'

He ceased, and sank back exhausted. His fervid declamation produced a considerable impression upon the auditory; but it soon disappeared before the calm, impressive charge of the judge, who reassured the startled jury, by reminding them that their duty was to honestly execute the law, not to dispute about its justice. For himself, he said, sustained by a pure conscience, he was quite willing to incur the hazard hinted at by the prisoner. After a careful and luminous summing up, the jury, with very slight deliberation, returned a verdict of 'Guilty.'

As the word passed the lips of the foreman of the jury, a piercing shriek rang through the court. It proceeded from a tall figure in black, who, with closely-drawn veil, had sat motionless during the trial, just before the dock. It was the prisoner's mother. The next instant she rose, and throwing back her veil, wildly exclaimed, 'He is innocent—innocent, I tell ye! I alone!'

'Mother! mother! for the love of Heaven be silent!' shouted the prisoner with frantic vehemence, and stretching himself over the front of the dock, as if to grasp and restrain her.

'Innocent, I tell you!' continued the woman. 'I—I alone am the guilty person! It was I alone that perpetrated the deed! He knew it not, suspected it not, till it was too late. Here,' she added, drawing a sheet of paper from her bosom—'here is my confession, with each circumstance detailed!'

As she waved it over her head, it was snatched by her son, and, swift as lightning, torn to shreds. 'She is mad! Heed her not—believe her not!' He at the same time shouted at the top of his powerful voice, 'She is distracted—mad! Now, my lord, your sentence! Come!'

The tumult and excitement in the court no language which I can employ would convey an adequate impression of. As soon as calm was partially restored, Mrs Bourdon was taken into custody: the prisoner was removed; and the court adjourned, of course without passing sentence.

It was even as his mother said! Subsequent investigation, aided by her confessions, amply proved that the fearful crime was conceived and perpetrated by her alone, in the frantic hope of securing for her idolised son the hand and fortune of Miss Armitage. She had often been present with him in his laboratory, and had thus become acquainted with the uses to which certain agents could be put. She had purloined the key of the recess; and he, unfortunately too late to prevent the perpetration of the crime, had by mere accident discovered the abstraction of the poison. His subsequent declarations had been made for the determined purpose of saving his mother's life by the sacrifice of his own!

The wretched woman was not reserved to fall before the justice of her country. The hand of God smote her ere the scaffold was prepared for her. She was smitten with frenzy, and died raving in the Metropolitan Lunatic Asylum. Alfred Bourdon, after a lengthened imprisonment, was liberated. He called on me, by appointment, a few days previous to leaving this country for ever; and I placed in his hands a small pocket-Bible, on the fly-leaf of which was written one word—'Ellen!' His dim eye lighted up with something of its old fire as he glanced at the characters; he then closed the book, placed it in his bosom, and waving me a mute farewell—I saw he durst not trust himself to speak—hastily departed. I never saw him more!

SHAKSPEARIAN HYGIENE.

SHAKSPEARE, that 'myriad-minded man,' as Coleridge has emphatically called him, who has left no subject untouched and unadorned, has scattered through many of his wondrous plays scraps of medical wisdom of equal truth and value with anything that science can teach us. A few of these *hygiënic* maxims, or plain rules of health, we here subjoin.

First we have the important functions of the stomach in the animal economy accurately sketched in the fable of the *Belly and the Members* in 'Coriolanus.' The stomach thus replies to the rebellious limbs:—

'True is it, my incorporate friends, quoth he,
That I receive the general food at first
Which you do live upon: and fit it is;
Because I am the storehouse and the shop
Of the whole body. But if you do remember,
I send it through the rivers of your blood,
Even to the court, the heart—to the seat o' the brain;
And through the cranks and offices of man,
The strongest nerves, and small inferior veins,
From me receive that natural competency
Whereby they live.'

And now,

'May good digestion wait on appetite,
And health on both;'¹

rather than

'A sick man's appetite, who desires most that
Which would increase his evil;'²

at the same time remembering that

'Nature's with little pleased, *enough's* a feast.'

The influence of the mind on the digestive organs is thus glanced at, when the poet makes Henry VIII., in giving Wolsey the schedule of his ill-gotten wealth, say—

'Read o'er this—(giving him papers)
And, after, this; and then to breakfast, with
What appetite you may.'

Nor is the 'green and yellow melancholy' of her who 'never told her love' to be regarded as a metaphorical or poetic fiction.

'And truly, for aught I see, they are as sick that surfeit with too much, as they that starve with nothing.'³

¹ Macbeth.

² Coriolanus.

³ Merchant of Venice.

How often is the wealthy epicure, even although

——— 'Epicurean cooks
Sharpen with cloyless sauce the appetite,'¹

tempted to exclaim,

'Will Fortune never come with both hands full?
She either gives a stomach, and no food—
Such are the poor in health—or else a feast,
And takes away the stomach; such are the rich:
That have abundance, and enjoy it not.'²

From the facetious Sir Toby Belch we may learn the benefit of early rising; for, says he,

'Not to be a-bed after midnight, is to be up betimes; and *diluculo surgere saluberrimum est*, thou knowest.'³

Hear likewise the reward of active exertion, the industrious poor man's especial privilege:—

'Weariness can snore upon the flint, while resting sloth
Finds the down pillow hard.'⁴

Rarely, indeed, are the indolent and luxurious

'As fast locked up in sleep as guiltless labour
When it lies starkly in the traveller's bones.'⁵

Many a time and oft does the pampered invalid, as he tosses restlessly on his uneasy couch, cry out in the language of the dying monarch—

'Sleep that knits up the ravell'd sleeve of care,
The death of each day's life, sore labour's bath,
Balm of hurt minds, great nature's second course,
Chief nourisher in life's feast'—

——— 'Sleep, gentle sleep,
Nature's soft nurse, how have I frightened thee,
That thou no more wilt weigh my eyelids down,
And steep my senses in forgetfulness?
Why rather, sleep, liest thou in smoky cribs,
Upon uneasy pallets stretching thee,
And hushed with buzzing night-flies to thy slumber;
Than in the perfumed chambers of the great,
Under the canopies of costly state,
And lulled with sounds of sweetest melody?
Oh thou dull god, why liest thou with the vile,
In loathsome beds; and leav'st the kingly couch,
A watch-case, or a common 'larum-bell?
Wilt thou upon the high and giddy mast
Seal up the ship-boy's eyes, and rock his brains
In cradle of the rude imperious surge;
And in the visitation of the winds,
Who take the ruffian billows by the top,
Curling their monstrous heads, and hanging them
With deafening clamours in the slippery clouds,
That, with the hurly, death itself awakes?
Chast thou, oh partial sleep! give thy repose
To the wet sea-boy in an hour so rude;
And, in the calmest and most stillest night,
With all appliances and means to boot,
Deny it'—unto me?⁶

That excessive exercise of the mind is injurious to the body, is constantly seen in the lean, pale, shrivelled aspect of hard students. Thus Cæsar says—

'Let me have men about me that are fat;
Sleek-headed men, and such as sleep o' nights;
Yond' Cassius has a lean and hungry look—
He thinks too much.'⁷

Compared with such medicine as healthful exercise, 'the most sovereign prescription in Galen is but empiric, and, to this preservative, of no better report than horse-drench';⁸ so that he who makes good use of it may well declare, 'I will make a lip at the physician,'⁹ and is almost disposed to exclaim, with Macbeth—

'Throw physic to the dogs, I'll none of it!'

'Out, loathed medicine; hated poison, hence!'¹⁰

For most of our slighter ailments we shall often find that

'The labour we delight in physics pain.'¹¹

Beware, however, at all times of those pests of society—quacks:

——— 'I say we must not
So stain our judgment, or corrupt our hope,
To prostitute our past-cure malady
To empirics.'¹

SECOND VISIT TO THE ANTIQUARIAN MUSEUM.

On the return of Mrs Russell and her friends from the visit to the Museum of the Society of Antiquaries, which was described in a former number, they found Mr Gregor awaiting them, and overwhelmed him with exclamations of wonder and interest about the objects which had engaged their attention in that curious collection.

'I had no conception that they could have proved so attractive,' exclaimed Miss Gregor to her father. 'I am sure I have heard more than one of my companions speak of a visit to it with extreme indifference. I really believed there was nothing worth looking at, even after we had glanced round the Museum, until Uncle Lauder directed our attention to its contents. I do believe Mrs Russell and I might have returned home, had we been left to our own guidance, vowing we had seen nothing.'

Mr Gregor smiled as he replied: 'Do you remember a story I used to read to you long ago, in Dr Aikin's delightful "*Evenings at Home*," entitled *Eyes and no Eyes; or the Art of Seeing*. Two schoolboys return home from a holiday ramble. Robert has been to Broom-heath, round by the windmill on Camp-Mount, and home through the meadows by the river-side. He declares it to have been all very dull: he met nobody, and saw nothing. Meanwhile William arrives, and recounts the delightful walk he has had. Here a parasitic mistletoe tempted him to pause, there his attention was arrested by a woodpecker. Insects, the meadow flowers, the fine view, the meandering stream, the setting sun, all interested and delighted him. And where, think you, had he been walking?'

'I remember the story, I think,' said Miss Gregor, with a look of some confusion; 'but what has it to do with our visit to the Antiquarian Museum?'

'Much, my dear Jane,' replied her father. 'William's delightful ramble was found, on inquiry, to have led him over exactly the same route which had proved so dull to his indifferent companion; and your pleasant visit to the collection of antiquities to-day—thanks to Uncle Lauder's teaching you to use your eyes—was spent in inspecting exactly the same objects which your companions had pronounced so unattractive. Depend upon it, the question of *Eyes or no Eyes* enters far more largely than most people think into the proper use and the enjoyment of experience.'

'I feel,' said Mrs Russell smiling, 'that your remarks are not a whit less applicable to myself than to Jane. Mr Lauder has taught me a lesson which I shall not soon forget, for I was equally ready on my first visit to the antiquities of *Auld Reekie*, and to those of the New Town, to follow the example of Sterne's splenetic Smelfungus, who returned from the grand tour only to pronounce all barren. But I hope Mr Lauder has found us such willing pupils, that he will favour us with his able guidance to finish our survey of the Museum.' Mr Lauder assured his friends of the pleasure it would afford him to comply with their request, and they accordingly accompanied him a day or two afterwards to renew their inspection of that varied collection of antiquities.

'Our whole time,' said Mr Lauder, 'was taken up on our first visit in inspecting the objects belonging to what archaeologists agree in styling the *Stone and Bronze Periods*. They include all those relics of a remote period which indicate to us the habits of the rude nomade tribes who first peopled the north of Europe, and form a depart-

ment peculiarly valued by the archæologist. He justly prides himself on having written a new and most important chapter in the history of the human race, and in the annals of our own country, based on scientific inductions derived from such relics. In this department the Edinburgh Museum is very complete. Though the examples are not numerous, no important link is wanting in the chain of evidence, and it will well repay repeated visits and careful study. Now, however,' said Mr Lauder, 'we turn to a new and entirely different department. Mark the peculiar forms of the British and early Celtic pottery in the case we were examining on our last visit. Some of the urns are evidently finished with much care. Great labour has been devoted to their ornamental decoration, and we find among them considerable variety of form. Now, however, we shall turn our attention to the *Roman period*. The adjoining case is entirely filled with Roman pottery, in which department the Museum is also very well provided. Here are examples of Romano-British pottery from Inveresk and Falkirk in Scotland: from London and Colchester in England; from France, Spain, and even from Tangier. It is impossible for the most careless observer to overlook the marked contrast in form, even of the very simplest and rudest of the latter, when thus placed in juxtaposition with the fictile productions of the Celtic era. In the Roman pottery we at once detect the influence of the potter's wheel, while we observe the beautiful combinations of elliptic lines to which so much of the graceful symmetry of Greek and Roman art may be traced.

'Not less curious and interesting are the smaller fictile works of the adjoining case; the small cinerary cups, *incense cups*, as they are frequently styled, and the *lachrymatories*, or tear-bottles, which were placed in the tombs as emblems of the sorrow of weeping friends. The latter idea, indeed, is derived from a very remote period. We discover the expression of it among the Egyptians at the funeral of Jacob, where the great company that had come up out of Egypt paused for seven days at the thrashing-floor of Atad beyond Jordan, "and there they mourned with a great and very sore lamentation." A similar practice may be observed among the native Irish in our own day. But a more distinct resemblance to the Roman lachrymatory is discoverable in the reference made by David, amid his lamentations in the fifty-sixth psalm, where he exclaims, "Thou tellest my wanderings; put thou my tears into thy bottle."

'And were these little bottles really filled with tears, uncle?' exclaimed Miss Gregor. 'I would cry for a month, I think, without filling the largest of them.'

Mr Lauder smiled as he replied, 'My dear Jane, human nature appears, upon the whole, to have been very much the same among the old Romans as it shows itself in our own day. We frequently find the most costly funeral and the most lugubrious epitaph where very little real sorrow is felt; and very possibly these huge lachrymatories, that could hold wellnigh a pint of tears, were only the ostentatious formula of grief of some decorous Roman widow or impatient heir.'

Mrs Russell. Really, there does seem something excessively ridiculous in the idea of a disconsolate widow sitting with a bottle at each eye, in order to collect satisfactory evidence of her sorrow.

Mr Lauder. Doubtless. And yet we must beware of judging thus hastily of the old Roman matron, or thinking of her only like Lady Macbeth, struggling 'to show an unfeigned sorrow.' The best cure for any such misapprehension is a walk to one of our own cemeteries, where we have weeping Cupids, inverted torches, urns and wet clouts, *ad nauseam*, to say nothing of *disconsolate* inscriptions that might make a dead Roman laugh. But we must hasten somewhat faster over the collection if we are to finish the inspection to-day.

So saying, Mr Lauder proceeded to direct their attention to a very beautiful and curious collection of Roman lamps. One, from the Baths of Caracalla, has

a camel embossed on it; another, from London, is decorated with a frog; a third, of a very unusual but elegant form, represents a foot clothed with a sandal. Mr Lauder failed not to direct the attention of his companions to the potters' names stamped on these, as well as on the beautiful specimens of Samian ware, by means of which the antiquary is able to trace the manufacture of them to certain fixed localities, and to elucidate in a most satisfactory manner the extent of the commercial intercourse which prevailed at the period of the Roman occupation of Britain. Next the party examined the beautiful Roman bronzes, including several fine examples found in Scotland. The *fibule*, and other objects of personal ornament, specially excited the interest of the ladies; and, in particular, one elegant bronze brooch, beautifully inlaid, which, as Mrs Russell remarked, 'the finest lady might now be proud to wear.' In the same cases were specimens of Roman glass, including small lachrymatories; of Roman iron, including axe and spearheads, hammers, &c.; and of bronze sacred and culinary vessels. Next Mr Lauder drew their attention to a small but very valuable collection of Etruscan pottery, decorated with the graceful artistic designs, executed in black and white on a red ground, which form so valuable a feature of these monuments of antiquity.

'You see from these examples,' said Mr Lauder, 'how great was the change effected by the Roman invaders. They were, in reality, the missionaries of civilisation, introducing to our knowledge nearly all the useful and ornamental arts. Invention, however, was not exhausted. Here are brooches and other ornaments of the *Anglo-Saxon period* no less beautiful than those of the Romans, but altogether different in form; while of a later date we can examine a rich and varied collection of mediæval art, differing from both, and yet rivalling them in grace and beauty.'

Now that the interest of the ladies was thoroughly roused, it was only with great difficulty that Mr Lauder could get them to follow him when he sought to hurry them on from one case to another, so as to survey the remaining portions of the collection. A large central case, chiefly filled with mediæval objects in brass and iron, displayed a curious collection of spurs. One was from the field of Bannockburn; another from that of Falkirk; a third from Linlithgow Loch. One elegant pair had belonged to an old Lord Napier; another, beautifully inlaid with silver, were those of Archbishop Sharp; and a third had been worn by the great Gustavus Adolphus at the battle of Lutzen, where he fell. Swords, spearheads, bolts, and dirks in like manner carry back the fancy to the struggles of Wallace and Bruce, to the fatal field of Flodden, and to the romantic associations of 'the forty-five.'

In another corner a singular collection of keys attracts the eye and excites the fancy. One large one of antique form, dredged from Loch Leven, tells of the escape of the hapless Mary Stuart from her island prison, only to exchange it for crueller and more hopeless scenes of captivity. One thinks involuntarily, while gazing on this curious relic of old historic scenes, of the fair queen, with whom so many romantic associations are indissolubly bound up, and of her touching lament:—

'Born all too high, by wedlock raised
Still higher—to be cast thus low!
Would that mine eyes had never gazed
On aught of more ambitious show
Than the sweet flowerets of the field!
It is my royal state that yields
This bitterness of woe.'

The same case contains another, though less appropriate relic, associated with the fair Scottish queen—a curious ancient chisel recently found imbedded in the wall of Queen Mary's chamber in Edinburgh Castle, where her son James VI. was born. Another of the keys, decorated with a graceful coronet at its handle, was found on the lawn at Falkland Palace, and is sup-

posed to have belonged to her father James V. A variety of sculptured Gothic remains, and a richly-carved oak door, are the memorials of the private oratory of her mother, Mary of Guise; an ancient marble quegh, or Scottish drinking-cup, decorated with the crown and royal initials, is regarded as a memento of her son; a large and beautiful comb is affirmed to be that which arranged the long and graceful love-locks of her unfortunate grandson Charles I.; and, to close our enumeration of Stuart relics, the blue ribbon worn by Prince Charles in 1745, as part of the ensigns of the Order of the Garter, hangs amid the miscellaneous collection of another case.

'We have thus,' said Mr Lauder, after satisfying the interest and curiosity of his fair friends with anecdotes suggested by these romantic relics—'we have thus stepped, well-nigh at one bound, from the thirteenth to the eighteenth century: nor can we venture to retrace our steps. One case, indeed, entirely filled with mediæval ecclesiastical relics, awakens scarcely less interesting associations by its memorials of Robert the Bruce, of the good Bishop Kennedy, Mary of Lorraine, &c. The adjoining one is rich in equally valuable evidences of the civil arts of the same period. The next attracts by a miscellaneous, but scarcely less curious assortment—relics of Rob Roy, of Burns, and Scott; illustrations of Scottish manners and superstitions. Here, for example,' said Mr Lauder, 'is the collar of a Scottish slave of the eighteenth century.'

'A Scottish slave!' exclaimed Miss Gregor; 'was there ever such a thing, dear uncle?'

'Undoubtedly there was,' Mr Lauder replied; 'and here is a brass collar scarcely differing from that of your great watch-dog Jowler, which was worn by a Scottish slave only last century. You can read the inscription on it, engraved in large Roman characters—*ALEXR. STEWART, FOUND GUILTY OF DEATH, FOR THEFT, AT PERTH THE 5TH OF DECEMBER 1701, AND GIFTED BY THE JUSTICIARS AS A PERPETUAL SERVANT TO SIR JOHN ARESKINE OF ALVA.*'

'That is really a most remarkable modern relic,' said Mrs Russell. 'Do you know anything of the history of the unfortunate wretch who was doomed to wear this badge of slavery in a free country?'

'Nothing more,' replied Mr Lauder, 'than may be surmised from the circumstance of its discovery. It was dredged up in the Firth of Forth; and one can hardly avoid the conclusion that the unhappy culprit terminated his hopeless existence by a violent death. There is nothing, however, that an antiquary can do which involves so much danger of error and exposure as the giving the reins to his fancy. So let us proceed to employ our brief remaining time in seeing all that we can. We have arrived now, in our circuit of the Museum, nearly at the point from which we started, and here we are once more thrown back on remote antiquity. Here are antiquities of Mexico and Peru, constructed, in all probability, before the adventurous Columbus had found for Castile and Leon a new world; and alongside of them are the still older relics of Egyptian art, coeval, it may be, with the miraculous signs and wonders of Moses, and the exodus of Israel from the land of bondage. Among these are a variety of the beautiful little mummy-like figures usually styled *Penates*, one of the most remarkable of which is evidently designed as a representation of the god *Thoth*. Notwithstanding the grotesque form of the head, the beauty and grace of its form might stand comparison with a work of Greek art. But these, with the Egyptian rings, amulets, signets, bronzes, &c, must all be reserved for future study, if opportunity occurs.

'Let us now,' said Mr Lauder, 'take a hasty glance over the larger objects which stand exposed. Here is a valuable series of casts from the ancient Collegiate Church of the Holy Trinity, founded in Edinburgh, in 1462, by Mary of Guelders, the widowed queen of James II. of Scotland. Among them we discover the most grotesque caricatures of the monks; ludicrous, and, as

we would think, profane representations of imps, and devils, and monkeys, all of them most unseemly decorations for a church; sufficing pretty plainly to illustrate Scottish morals and manners in the middle of the fifteenth century. On the walls, again, are the old two-handed swords of the middle ages; Highland broadswords and targets, some of which have done service at Preston and Culloden. The long civic spear of old *Andro Hart*, the celebrated Edinburgh printer, famed not only for his Bibles, adorned with the quaint emblem of a heart, but also for his share in the famous tumult of 1596, when King James was put in such bodily terror, that he vowed in his wrath to level Edinburgh with the ground, and to make of it a hunting-field. We can almost fancy we see the sturdy old printer sallying forth, with his long spear and jack, and shouting "*Armour, armour!*" according to the fashion of the tumultuous old citizens of Edinburgh.'

A weapon of a very different description next attracted their attention. The world-famous stool of *Jenny Geddes*, with which she struck the initial stroke in the great civil war; hurling it at the dean of Edinburgh's head on his venturing for the first time to read the English liturgy in a Scottish church, with the pithy exclamation, '*Out, fause thief! wilt thou read mass at my lug?*'

Jenny's belligerent stool now reposes quietly within the time-worn pulpit of John Knox; while close by there stands in grim, but equally peaceful repose the ancient MAIDEN, the Scottish guillotine, by which so many brave and noble men have been done to the death. Popular tradition assigns its invention to the Regent Morton, and adds that he was the first to perish by its maiden axe. In this, however, tradition errs. Thomas Scott, one of the inferior accomplices in the murder of Rizzio, was the first whose death was accomplished by its means. Since then, the Regent Morton, the Marquis and Earl of Argyll, Sir George Gordon of Haddo, Johnston of Warriston, and a host of other victims, have perished by this seductively-titled, but dreadful engine of death, ere the happy Revolution consigned it to repose. A broad banner on the wall, inscribed, between the arms of the Scottish saltire, '*For Religion, Covenants, King, and Kingdom!*' is one of the standards borne by the Covenanters at Bothwell Bridge. A back and breast-piece of rusty armour, recently dug up on the same field, forms an equally appropriate memento of the enemies of the Covenant. Nor must we forget a copy of the Covenant itself, exhibited in one of the cases, with the signature of Montrose, Rothes, Lauderdale, and many others adhibited to it, who afterwards bore little love either to it or its adherents; while the horrible instrument of torture, the THUMBKINS, is displayed in a neighbouring case.

'You are familiar, I daresay,' said Mr Lauder, while they were looking at the thumbkins, 'with the story told of King William and his shrewd Scottish adviser Carstairs. This person, who was a clergyman, and one of King William's chaplains, had undergone the cruel torture of the thumbkins rather than betray his master's confidence. After the Revolution, the magistrates of Edinburgh presented the instrument to Carstairs, as the fittest memorial of his fidelity and courageous endurance. King William, it is said, hearing of this, ordered the thumbkins to be produced; and placing his thumbs in the engine, desired Carstairs to turn the screw, telling him that he wished to judge of his fortitude by experiencing the pain which he endured. Carstairs obeyed; but turned the screws with such courtly tenderness, as best suited their application to royal thumbs. The king remarked, on its pinching him a little, that it was unpleasant, but could be endured. At length the divine, feeling a natural jealousy of his own reputation, gave the screw so sudden a wrench, that the king roared for mercy, and vowed, had he been subjected to such a trial, he would have confessed anything they chose to dictate to him.'

'Did the king ever forgive him,' said Miss Gregor, 'for forcing from him so cowardly a confession?'

'He was much too magnanimous,' replied Mr Lauder,

'to take offence at such a cause; nor must we be misled by his friendly candour, to suppose that he would not have endured much, rather than betray confidence similarly reposed in him. So great was the influence Carstairs acquired and retained till his death, that his fellow-countrymen dubbed him with the questionable title of Cardinal Carstairs.'

It was now time that they should return home, and Mr Lauder expressed a hope that the Museum of the Antiquaries had not lost its first attractions on further inspection. To this Mrs Russell replied by assuring him that she only regretted she could not again and again return to familiarise herself with its varied contents. Before leaving, Mr Lauder obtained permission to visit the Council Room and the Library. In the former, they were gratified with the sight of some valuable historic portraits which adorn the walls. The most ancient of these is a fine portrait of Cardinal George Innes, who was created cardinal of St Lawrence in Lucina in the beginning of the fifteenth century; the first Scotsman, it is believed, who was made a prince of the church.

In the Library they were shown the Hawthornden Manuscripts, containing nearly the whole works of the Scottish poets Drummond and Fowler in their own handwriting. There also they saw original autographs of Queen Mary, King James I. and III., the two Charleses, Cromwell, Monk, Rothes, Lauderdale, Argyle, &c.; a beautiful manuscript Latin Bible of the fifteenth century; several finely-illuminated missals; a large Spanish music-book of the fourteenth century; and many rare and beautiful specimens of typography. Even the lobby, as they retired, attracted them with one or two quaint memorials of the olden time. A pair of huge steel pokers, of gigantic proportions, were pointed out to the visitors as the mace and sceptre of 'The Knights of the Cape,' a celebrated convivial club of last century, which numbered among its early knights Tom Lancaster the comedian, Fergusson the poet, Runciman, Jacob More, and other artists, and a host of citizens of no little note in their day. In another dark corner of the lobby their attention was directed to a quaint little Dutch mannikin, with goggle eyes; the identical old wooden citizen who long maintained his post, lint in hand, at the door of the ancient yarn merchant's booth in the West Bow, where the rioters of 1736 obtained the rope with which the wretched Porteous was hanged. With this grotesque memento of the famous Porteous mob, Mr Lauder and his friends bade adieu to the Museum of the Society of Antiquaries of Scotland; their minds stored with many pleasing and instructive recollections, which supplied ample subject for lively conversation during the remainder of the day, and still furnishes frequent topics for discussion in the friendly interchange of epistolary correspondence between Taunton and Edinburgh.

LIFE IN NEW SOUTH WALES.

WORKS on the Australian colonies continue to stream from the press, and if mistaken notions are still entertained respecting these regions, it can be owing to no want of materials for judging. The last book is so far likely to be impartial, as the author appears to have no personal interest in the success of the new country. He did not go out as a settler, but as a visitor in quest of health; and in committing his impressions to paper, he is uninfluenced by any prospect of returning to the antipodes.* Under such circumstances, we are disposed to receive Mr Townsend's representations with the respect due to the sentiments of an educated and tolerably observant person, whose residence in the colony of four years was long enough to familiarise him with the aspect of its men and things, and not long enough to

imbue him with the party prejudices of a resident. At the same time, the impression left upon us by the book is, that its author is more capable of describing than of reasoning, and that he is better able to understand the parts of a subject than the whole. His sketches of the various classes of the population, however, are all good and life-like, although of course not absolutely new; and to this portion of the volume we shall confine ourselves.

The city of Sydney, as it is now styled, contains a population of 60,000, collected in no more than sixty years, and is governed by a mayor and corporation. Its wharfs are excellent, watermen plying in neat wherries at their steps; but when approached by land, it resembles Birmingham in appearance, with manufactories surrounding it, and houses resembling the tradesmen's villas of the old country. The fresh colour of the English, however, is wanting in the inhabitants: in Sydney they are *done brown*. But in Sydney there are characters and costumes which alone are worth the trouble of the voyage. Here is a picture of a 'young corn-stalk' coming pacing along on a coarse-bred tramping filly:—'You observe that he has a very long pair of spurs, fixed in sockets in the heels of his boots. He wears a broad-brimmed cabbage-tree hat (manufactured from the leaves of the palm of that name); a check shirt, open at the neck, and presenting a *bold front*; a blue jacket, and a gay waistcoat. His trowsers are made, as those of many others, of the ticken generally used for the cases of beds, and are cut so much to the quick, that your dread of their bursting keeps you in a state of uncomfortable nervous apprehension. He wears an immense moustache, and Vandyck beard, and a red scarf or comforter is tied round his waist. I sketch strictly from life; and I well recollect the astonishment I felt when I beheld this apparition moving along in solemn state, "witching the world with noble horsemanship." Yet such a phenomenon would be an admirable bushman, would endure hunger and fatigue, and travel (as this person has done) many hundred miles to a distant station, sleeping out every night, and exhibiting great perseverance and foresight; and such a life he would greatly prefer to that of a salaried official in Sydney, upon whom he would look down with no small degree of contempt, as effeminate and helpless.'

In another part of the country our traveller saw a girl on horseback driving cattle with a stock whip. She bestrode her steed like a man; the gay ribbons of her bonnet fluttered in the wind; and she was arrayed in white pantaloons adorned with large frills. This was a 'currency lass,' the daughter of a settler, and a specimen of a generation which does not appear to be brought up in a very accurate knowledge of the old country. One of them asked if ticket-of-leave holders made good servants in England? and another, when talking of a visit to Europe, declared her intention to attend Queen Victoria's *At Homes* in Buckingham Palace.

A description is given of a farmer of New South Wales, which might well excite the envy and admiration of his brethren at home. 'The owners of this noble property hold, as freehold, eighty thousand acres of fine land, of which twenty thousand are naturally clear and fit for the plough, and I speak within bounds when I say that on the estate are five thousand acres of white clover. This, indeed, spreads so fast, that in a few years the greater part of the property will be covered with it; but a mixture of clover and rye-grass is preferred. On this estate, and on the adjoining waste lands, are maintained upwards of three thousand head of cattle, and several herds of horses. Wheat and maize are grown in great quantities; and the fields, when waving with these luxuriant crops, present a noble appearance, which is most striking when one enters the farm from the southward, after a wearisome journey through a barren country. . . . Great pains have been taken to improve the breed of cattle on this estate; and bulls have been imported from England at great expense. "Ella," a short-horned Durham, is a splendid

* Rambles and Observations in New South Wales, with Sketches of Men and Manners, Notices of the Aborigines, Glimpses of Scenery, and some Hints to Emigrants. By Joseph Phipps Townsend. London: Chapman and Hall. 1849.

creature, and cost £500; and there are also some beautiful Ayrshire bulls. Choice animals of this description are kept for sale in an extensive clover paddock devoted to them alone; and to this place they become so attached, that there is a difficulty in removing them, even in the company of cows. Some of the bullocks, reared and fed on the swamps, attain a great size, and a few weigh fifteen hundredweight; and the rolls of fat on their backs form hollows something like a saucer. . . . A large dairy is kept on foot, where often two hundred cows are milked, but only once a day; for, after the morning's milk is taken from them, the calves are allowed to run with them until night. These cows yield about two gallons of milk each per day, and under another system would doubtless give more. The skim-milk feeds a little army of pigs. Many beautiful mares are to be found amongst the herds of horses, and when I last visited the property, a stallion from the English turf was in the stalls. The horses bred on this property attain a good size, their points are well developed, and many have been sent to India.

The proprietors of this princely property lived in corresponding style. 'The owners of this estate reside in an excellent brick-house, which crowns a rising ground. Their hospitality is unbounded; and the "travellers' room," with its neat and clean beds, has been the place of rest of many a weary pilgrim. Well-built cottages have been erected in convenient situations for the accommodation of the different superintendents. The garden is large, and exceedingly productive; indeed, with such a soil, with moisture and a hot sun, what may not be expected? The prolific nature of the soil and climate is evidenced by the fact, that a peach-tree bears in the second year after the stone from which it sprung has been sown; and to the climate, as well as to the abundance of fine feed, the large size of the cattle is no doubt to be attributed. The Shoalhaven, being navigable, adds much to the value of the property; and the produce of the farm is sent up to Sydney in vessels built on the river. This estate would maintain some thousands of people; but the owners of it can never become rich by farming it. To give an idea of the value of farming produce in this colony, I may mention that one of these gentlemen told me that he once grew two thousand bushels of barley, but could only find purchasers for half the quantity, and did not know what to do with the remainder. This estate did not suffer by the late drought, and when I left the colony, the dairy returned £70 sterling per week in butter alone, many other dairies having been brought to a stand-still, and amongst them that at Ulladulla, where, indeed, the cattle were then dying for lack of food, at a distance of only fifty miles.'

The run of a squatter—that is, an unsettled breeder of sheep and cattle—described by Mr Townsend, was 100 square miles in extent, consisting of open flats divided by belts of trees. Here the squatter has numerous stations all apart from each other: his sheep station, breeding station, heifer station, and so on; and these stations require to be moved from time to time, on account of the drought. Some squatters grow their own wheat; but the frequent droughts render it so uncertain a crop, that their supplies have usually to be brought from a great distance in drays drawn by bullocks. The operations of the squatters extend over a line 1500 miles in length, and they sometimes go 400 miles into the interior. 'A large squatter is a great traveller, and is continually moving from one station to another, to inspect the state of his flocks and herds, and to attend to numerous operations going on amongst them; but fully to describe his operations would be to write a treatise on sheep, horses, cattle, and climate. Many perform long journeys in tandems; and those who are particularly hilarious adorn their horses with bells, and make the woods echo with the sound of the bugle as they rattle along. Some of them, in spite of the uncertainty of their tenure, had, when I was in the colony, as excellent cottages on their runs as settlers within

the boundaries, and lived in all respects as well. Not a few of these were married, and to most estimable and well-educated women, who lightened the home and cheered the heart of the wanderer.'

The shepherds are of course a class of men absolutely necessary to the squatter; and here they are—at home. 'A shepherd's hut is a hovel, built of slabs, and covered with bark. Between the slabs a man could thrust his foot, and nothing could be more easy than to cover the walls, as well as the roof, with bark, thus making the tenement weather-tight; but the men will not take the trouble to do this, and probably airiness in summer compensates for the cold of winter. The accommodations are the simplest. A sheet of bark, on trestles, forms the bedstead on which the mattress is spread; and another sheet, supported by sticks, does duty as a table. The cooking apparatus consists of an iron pot. If the traveller falls in with one of these solitary dwellings, he is immediately asked to take "a pot of tea;" and the tea is produced from a bag that hangs on a peg, and the sugar from another; whilst salt beef and damper make their appearance from some very original substitute for a shelf. The bark is generally secured to the roof by strips of green hide; and it is a common saying, that if it were not for green hide and stringy bark, the colony would go to a place more remote than even the antipodes. In some huts which it has been my lot to visit I have had rough fare, and rougher beds. The salt beef is sometimes hard and black, worthy only of a place in a museum, and certainly not of a depository in a human stomach. "The greatest hardship I endured was salt beef," says William Penn; and this I can echo from the bottom of my heart. In some huts black pieces of beef are suspended from the roof by strings, and if it is marvellous that any man can be induced to swallow such a curious production, it would be still more marvellous if he could digest it. My bed has sometimes been a sheet of bark with a sack spread upon it; and I have lain, near the fire, almost literally in sackcloth and ashes!'

The hut-keeper receives the sheep at night from two men, who have each the charge of a separate fold. Being answerable for the safety of the flock till the morning, he sleeps in a kind of sentry-box, to guard them against the attacks of the native dogs. 'The first object of the ambition of a labouring man in the bush is to possess a mare. He then buys a few cows; and many a "ticket-of-leave holder" has a nice little property in cattle and horses before he becomes free. Some shepherds have their wives and children with them in the bush; and, with the assistance of the hut-keeper, milk a cow; and, where the climate will allow it, cultivate a small garden; but this is the exception, and not the rule; and the opossums often destroy their gardens, at least the produce of them, when there is any.'

The stockman, or keeper of cattle, considers himself to be a personage of more dignity than the shepherd. He is always on horseback, and his greatest pride is in penetrating to a part of the country previously unknown. The bullock-driver performs long journeys, carrying the wool or tallow to market, and bringing back supplies for the station. 'He is generally trustworthy, save as respects rum and tobacco. He rarely can resist the allurements of these bewitching articles, and resorts to the most ingenious devices for wheedling the spirits from the casks. He carries a mattress with him, and sleeps under his dray, whilst his bullocks graze near it. I think no sight in the colony would strike a newcomer so much as the passage of a number of drays over Liverpool range. Often thirty pair of bullocks are to be seen harnessed to one dray, and the shouts and execrations of the drivers, with the noise made by their whips, are almost appalling. No men swear more dreadfully, or have so great a variety of oaths of the most extraordinary derivation. As horse-teams increase in number, it is to be hoped that some of their expletives will be laid aside. Their "camps" at night are in regular gipsy style, and they always light huge

fires. In a large boiler, which was brought on a dray to the station I described in the last chapter, a woman and her children used to seat themselves during the day as they travelled, and I am assured by a friend that he saw her there knitting very quietly.

The position of the convict population is already sufficiently familiar to the public. Mr Townsend, with regard to them, remarks that he was much struck by the good behaviour of men who had been convicts, and he tells of one of them driving about in his carriage—his fortune having been gained by honest and untiring industry. He describes the fate of some convicts well known on this side of the ocean by their names and their misdeeds. 'Bolam was employed in Sydney as a clerk, and I believe took an account of the linen that was sent to the factory to be washed. In 1842, Frost the Chartist was at Cascade, near Port Arthur, and laboured in a gang, but was permitted to sleep alone. He was sent to Cascade for insolence. When first landed, he was sent to Port Arthur, and employed as a copying clerk. When I last heard of him, he had obtained his ticket of leave, and was a shopman in a chemist's shop. Jones, the Chartist watchmaker, was overseer of the mess of some dozen refractory lads at Port Arthur. He was circumspect and orderly, and worked at his own trade, or in the nailer's shop. Williams was then also (1842) at Port Arthur. He built a boat, and effected a temporary escape, and was retaken, and was worked in a chain gang. Some of his associates in his flight, when at large through his means, committed a murder, and were hung. He was represented to be a bad, designing man.'

At the conclusion of the volume there is a chapter for emigrants. The labourers most in request in New South Wales are of course stockmen and shepherds; but carpenters, blacksmiths, and shoemakers do very well. A convict bootmaker was paid by his master 10s. a pair for making his own boots. Shipwrights and sawyers likewise do well.

Mr Townsend's chief care, however, is bestowed upon emigrants of the genteeler class, who go out with the intention of purchasing land and employing servants. The autumn, he says, is the best time for sailing from England. The passage money ought not to be much more than L.80, which will comprise good fare, separate cabins, room for a ton, by admeasurement, of baggage, and wine, beer, &c. at discretion. Money, with the exception of a handful of sovereigns for spending in any port they may call at, can be exchanged with the Union Bank of Australia for a letter of credit on Port Philip or Sydney. London ships are better than Liverpool ships. 'On going on board some of the ships bound for New South Wales, it would be easy to imagine that one had boarded a pirate, all the passengers seeming to think it necessary to be armed to the teeth. Double-guns, duck-guns, rifles, pistols, swords, &c. adorn the different berths, and the passengers themselves are often in full piratical costume. But the expense of buying these arms is useless, and if the owners of them could be followed to their destination, such weapons would probably be soon found rusting neglected in a corner. A good gun, a few bags of large shot, and a few pounds of powder, will, however, be found useful in the bush, and in Sydney a good gun can sometimes be bought for a few shillings—the piratical gentlemen aforesaid being often anxious, in the course of time, to sell their weapons. Powder and shot are comparatively dear in Sydney.'

On getting to Sydney, the plan Mr Townsend would adopt himself is this: 'I should go to Illawara and rent about a hundred acres of land well covered with clover; or if I had capital enough, I should buy such a place, taking care that there was plenty of water upon it, and, if possible, the means of irrigation; for I am convinced that the settlers there could make their farms as valuable again if they introduced this, since, though the district is not subject to drought, there is often much dry weather. If there were no house on the place, I should

build a brick cottage, which I think would cost about L.150. I should go to Mr Berry's, or to Mr McLeay's, at Ulladulla, and buy sufficient dairy cows to stock this land, and engage a steady married couple to manage the dairy. This dairy would be my mainstay for a time; for the butter, cheese, pork, and bacon produced on the farm would sell well in Sydney, provided that I attended to the matter myself. It would be necessary that I should be often, if not always, up at daylight, and that I occasionally saw that the cows were properly milked. If I neglected my own interests, I could not expect that my servants would attend to them.

'I should keep bees, and make as much as possible of honey; and I should also establish a good garden, and send fruit regularly to Sydney. I should have to get, yearly, a good crop of clover hay, lest the stock might suffer in the winter or the dry weather; and I should have to find a run for the dry cows, lest they should consume the clover without giving a return. But, without further details, this farm at Illawara should be my homestead, and nothing should induce me ever to encumber it.' He would not at first attempt to grow wool, but would put out flock after flock of sheep into the hands of a squatter, on the principle of division of profits, till he had a sufficient stock to make it worth his while to look out for runs, and sit down as a squatter himself. To start at once in this capacity, a man should be possessed of L.20,000; and then, after realising a fair profit, in order to secure himself from the vicissitudes of a new country, he should return home as fast as possible!

THE ANGLO-FRENCHMAN.

A SINGULAR character appeared in France about the year 1772, under the name of Thomas Dhèle; but he was the son of an English baronet, and his real name was Hales. He was born in Gloucestershire in the year 1740, and his father being fond of adventure, was anxious that the only descendant of his house should encounter the perils of the sea. As soon, therefore, as the discipline and the studies of childhood were over, he was sent into the navy. In this service he visited almost every part of the world, and afterwards took up his abode in Italy, where he resided a considerable time, and whence he finally removed to Paris with the wreck of his patrimony.

Dhèle was now above thirty years of age; and though his constitution was much impaired by dissipation, he still had a very handsome person. The lines of his face bore a striking resemblance to some of the English court portraits by Vandyck, the mouth wearing an expression of careless disdain.

He soon spent his all at Paris; and finding himself penniless, he began to write plays for the Italian theatre. Such was his talent, that his very first work was deemed a masterpiece. He wrote slowly, for he never liked to retouch his work: he said that the judgment of to-morrow had no more value than that of to-day. By this employment he realised above a thousand crowns a year at an average. But what was that to an English baronet who had spent a fortune? His sudden poverty, however, did not in the slightest degree alter the pride either of his feelings or manners: his bearing indicated the gentleman, however mean his attire. Grétry, who has left notes on the life and character of Dhèle, says that he has seen him for a long time almost naked, but yet inspiring no pity. 'His noble and severe countenance seemed to say, "I am a man, what can I want?" It was the haughtiness of a Spaniard, with the composure of an Englishman.'

He was one of the ablest critics of his day, though he never wrote his critiques. In matters connected with the drama there was no appeal from his judgment; and so clear were his views of the political horizon, that the newsmongers often framed their articles according to his prognostication of the probable course of events. But out of consideration for the writers, as well as re-

spect for himself, he never spoke of this, or claimed the credit due to his superior penetration.

His first piece at the theatre in association with Grétry was 'Le Jugement de Midas.' The original wit of Dhèle, softened by the lively and beautiful music of Grétry, elicited the highest applause from the Parisians, and the authors were loudly called for. Dhèle, very shabbily attired, came forward with perfect gravity, and without appearing either pleased or annoyed—'This,' said he, 'is the prescribed epilogue of my comedy.'

A year afterwards, Dhèle and Grétry, who always lived on the best terms with each other, completed 'L'Amour Jaloux,' the ground-work of which is taken from the English comedy of 'The Wonder.' It was played first at Versailles; and on the day of its representation, while Grétry was strutting about at the château, unable to conceal his elation, Dhèle was quietly seated at the table of a tavern, like a man who had retired from the vanities of life. The success of 'L'Amour Jaloux' was still more brilliant in Paris at the Italian theatre; and people began to make inquiry as to who or what this gifted Englishman might be. The odd stories told of him only served to raise their curiosity still higher; and many were anxious to judge of his eccentricities from their own personal observation. 'If I appear to them a singular man,' said he, 'it is only because they are not simple. A simple man—that is what I am.'

The Duke of Orleans, learning that Dhèle generally passed his afternoons at the Café du Caveau in the Palais Royal, disguised himself one day, and went down to see him. He found a remarkably grave man, sitting with his legs sometimes crossed, sometimes stretched on a chair, musing at leisure, and quite regardless of all around him. If he engaged in conversation, he spoke little, but always well: he never took the trouble of telling people what they must already know; and he interrupted the loquacious by saying in a dry tone, 'That is in print.' If he approved, it was by a slight bow of the head; if he was teased with nonsense, he crossed his legs, locked them tightly together, took snuff, and looked in another direction. The duke, knowing that Dhèle was in pecuniary difficulties, sent him next morning a hundred louis by a valet.

'You will say that this is the first payment fallen due of a pension which the Duke of Orleans grants to Monsieur Dhèle for his eloquence.'

The valet found Dhèle lying on a bed which was anything but luxuriously soft.

'Do I disturb you, sir?'

'Yes.'

'You were asleep?'

'No.'

'You are Monsieur Dhèle?'

'Yes.'

'Shall I shut the door?'

'No; for if you chatter much longer'—

'Don't disturb yourself; I am come from the Duke of Orleans.'

'Well?'

'He sends you the first payment of a pension which his royal highness grants you for your eloquence.'

'That is well.'

'Here are a hundred louis.'

'One for you.'

'Is that all I am to say to his royal highness?'

'Yes.'

'But'—

'Begone—the Duke of Orleans knows my eloquence.'

Within three or four months afterwards the hundred louis were all gone, as may easily be believed. The Duke of Orleans having had 'Le Jugement de Midas' played at his own residence, gave Grétry a hundred louis to divide with Dhèle. Grétry wrote to Dhèle with his share of the money. He answered the servant, 'It is right.' Grétry, a little piqued at having no reply to his letter, hoped that Dhèle would answer him in person; but twenty times he met him in vain. At last

he could not help saying, 'You no doubt received'—
'Yes.' Dhèle added not another word.

He was held up as an example of ingratitude for seeming to forget his benefactors. But did he forget?

One day at the café he was insulted by a man who had lent him money without any security. 'Here I am forced to fight a duel with myself,' said Dhèle: 'it is a sad waste of time.' The creditor and debtor, to avoid delay, withdrew, unattended, to a garden in the neighbourhood. Scarcely had they drawn swords, when Dhèle, who had the advantage of superior height and self-possession, very adroitly struck his adversary's weapon into the air, and said with his usual gravity, 'If I were not your debtor, I would kill you; if we had witnesses, I would wound you; we are alone, I forgive you.'

During the time of his greatest distress, he called one day at the house of a friend who had just gone out, and his eye was caught by a handsome *culotte** made of lilac silk. He considered that his own had served its time, put on his friend's *culotte* without the least ceremony, and walked off, delighted with his good fortune. By and by the friend returned home, and found a rag at the foot of his bed. 'My *culotte*, where is my *culotte*?' The reply was, that Dhèle had been there: but he could not believe that Dhèle would be guilty of such an act. In the evening, however, he visited the Café du Caveau, and at the first glance he recognised his property: Dhèle saluted him as usual. The friend, more and more surprised, tapped playfully on Dhèle's leg.

'Is it not there?'

'Yes,' said Dhèle with the greatest coolness; 'I had none.'

A disease of the chest, the consequence of dissipation and breathing so constantly the atmosphere of theatres and taverns, brought poor Dhèle to the brink of the grave about the beginning of the year 1780. He rallied, however, as the spring advanced; and thinking he had escaped all danger, he returned to his labours. He had become seriously attached to Signora Bianchi, an Italian actress, who condescended to think him amusing, and who perhaps admired him for his simplicity. With all his imperturbable gravity, he was a perfect child in the society of a female. The self-possessed Englishman really loved with all the delicate sentimentality affected by a Frenchman. Yet he spoke of his passion, as of everything else, without circumlocution.

'Have you nothing more to say, Dhèle?' asked Signora Bianchi one evening.

'I love you.'

'What else?'

'You are beautiful.'

'Well?'

'I love you.'

The Italian theatre was discontinued; the young lady set out for Italy, and it proved the deathblow of the poor philosopher. For his consolation, she promised to await him at Venice. He spent two months endeavouring to obtain money to follow her; but in vain. No charitable soul came to his assistance. Grétry offered him a hundred louis, but it was for a comic opera which was to be finished before he set out. Betaking himself to work too assiduously, he again became ill, and having once taken to his bed, he never left it but for his grave.

He had by his pillow a travelling book, and the opera which he had commenced. The situation of the persons of his piece occasionally diverted his mind, and led him for a time to forget his sorrows; but grief at length quite overcame the poor patient. He refused to admit any one whatever to visit him, desiring to dwell continually on the thoughts of his love and his despair. At the last hour, however, Grétry contrived to obtain access to his room.

'Well, Dhèle?'

* Pair of small-clothes.

'Better.'
'And our opera?'
'Two acts.'

Dhèle was carefully turning over the leaves of the travelling book.

'What are you looking for there?' said Grétry.

'My way.'

'Where are you going?'

'To Venice.'

'Is this a serious passion then?'

'Yes.'

Dhèle, who had raised himself up, now sunk back on the pillow. Grétry was struck with the sudden pallor of his countenance and the wildness of his eye.

'Would you like a drink?' asked Grétry.

'No.'

'What do you wish for, my poor friend?'

'The travelling book,' said Dhèle, and expired immediately.

THE DATURA.

THE article on 'Hashish,' which appeared in No. 256, has attracted the attention of several correspondents; one of whom, who writes from Patna in Bengal, desires to draw our attention to the narcotic effects of the common *datura*, giving some curious instances of the way in which it is employed by the thieves of India. Before we come, however, to his information, we shall mention, for the benefit of general readers, what the *datura* is, and to what uses or abuses it has been turned in other parts of the world.

The plant belongs to the order Solanaceæ, or nightshades, in which are included the deadly nightshade and henbane, as well as the wholesome potato and tomato. Tobacco and belladonna are likewise members of this apparently anomalous order, and the *Acoeanthera venenata* of the Cape, with the juice of which the Hotentots envenom their weapons, and poison the baits laid for wild beasts. The *Datura stramonium*, or thorn-apple, is smoked as a palliative in spasmodic asthma, and used as a medicine in mania, epilepsy, convulsions, and tic-douloureux. The seeds, taken internally in small doses, bring on a kind of delirium. The *Datura tatula* and *metel* are still more energetic, and are said by some writers to have been used by the priests of the Delphic temple to produce the ravings of the Pythia. It is supposed, however, that the chasm over which the tripod was placed on which the prophetess sat, was known for the properties of the smoke it emitted before the building of the temple—the shepherds tending their flocks in the neighbourhood, on approaching the place, being seized with convulsions. If this be correct, the *datura* must be found not guilty in the present instance; unless it was a *particeps criminis*, in heightening the natural effects of the smoke, under the influence of which the Pythia sometimes leaped from her tripod and fell down in convulsions, which in a few days ended in death. The seeds of the *Datura sanguinea*, however, were certainly used for a similar purpose in the Temple of the Sun in the South American city of Sagomozo; and the Peruvians prepare from them an intoxicating drink, which either stupifies or maddens, according to its greater or lesser degree of dilution.

The common *datura* of Bengal is described by our correspondent as a rambling, thorny plant, with a very large and beautiful white flower; and it may be interesting to our medical readers to know that its leaves, when heated by being held over the fire, are used by the natives for assuaging pain in the head. The root, however, supplies a powder, which is turned to a less beneficent account. Thuggee, as everybody knows—thanks to the energetic measures of the British government, so zealously carried out by Colonel Sleeman—is now almost, if not entirely, unknown; but it has been succeeded by a kind of robbery, into which murder no longer enters as a necessary part of the crime. The victim is not, as formerly, strangled or poisoned, but

merely drugged—or hoccussed, to use a slang expression—and this is effected in a safe and simple manner by throwing a little of the *datura* powder into the flour which the traveller is about to prepare for his dinner. Now and then, it is true, the drugged dies; but this is an accident, and by no means desired by the practitioner, whose interest it is that his patient shall merely be reduced to a state of temporary insensibility. The effects of a liberal dose sometimes last for a couple of days.

Although the powder retains its energy for a long time, the robber makes it only in such small quantities as may be readily concealed upon the person; and indeed he has no occasion to do otherwise, as the plant is common, and grows wild throughout the country. The thoroughfares are beset with these people, who get into conversation with the wayfarers they meet, and induce them to join company. If the traveller only consents to dine along with his new friend, he is undone. An account of the process may be given from the mouth of an approver, as the Indian king's-evidence is called; and we shall put into the witness-box a gentleman of the name of Sookoo. 'I first learned the business of drugging,' said he, 'from Ramkishan, whom I met in Calcutta some four years ago. He asked me to find out a good subject, and I told him of a man who had some 600 rupees (L.60) worth of property. Ramkishan hired the house adjacent to this man's, and next day picked up his acquaintance. Two days after that, he contrived to put some powder into his *shrāb*, and he became insensible. We then broke open his box, and went off with 400 rupees' worth of property and jewels, which we realised and divided. Some time after this, as I was going along the Grand Trunk Road alone, I met a man returning from Calcutta. We began talking together, and walked to a well close to a police-office, and around which there were some eight or ten more travellers assembled. I drew up some water, and gave him to drink, asking him at the same time to eat some of the food I was myself eating: he did so. I mixed a little powder into the portion I gave him, and in about an hour he became insensible. Some of the travellers and policemen asked me the cause. I told them he had been drinking freely, and was tipsy; they believed me, and I attended to the insensible man until I secured his purse, containing some fifteen or twenty rupees. I then went off on some pretence, leaving him at the police-office. About seven months after this affair, I and a friend met two merchants who had been to Patna to sell goods. We got leave to travel with them, and put up for the night at a *serai*; they bought some flour, and went to the well for water, and I managed to put some of the powder into it. In an hour or less they both became insensible, and we took their property—some 300 rupees. We then wanted to get off, but found the door of the *serai* was shut. On saying, however, that one of us was ill, we got out and made off. About two years ago I and Ramsahai met a man on the road with a tin-box; we walked together some way, and on coming to a toddy-shop, stopped to drink. He would not leave his box, and requested me to bring him a little grog; I did so, and we walked on. In about three-quarters of an hour he fell down insensible, and we relieved him of his box and all his clothes. We got nearly 800 rupees from the sale of the contents (jewels, ornaments, &c.). About seventeen months ago I and Gungaram met four men and two servants, and consented to carry their luggage for them; we all slept in a house in the village of — on the second night, and there they wished to dismiss us; but we begged to be entertained for a few marches farther on towards our homes, and they agreed. The man whose box I had charge of bought some flour, and I contrived to drug it; he ate, and became insensible. His companions were all asleep, and I, after five hours' work, broke open the box, and, with Gungaram, made off with its contents.'

The class to which Sookoo belongs do not, like the Thugs, mingle religious notions with their crimes.

They are simply thieves, who do their spiriting as gently as they can, and are satisfied with small gains. In India, a labouring man or servant can keep himself, his wife, and four or five children, for four rupees a month; and it is no wonder, therefore, that so many should be tempted to have recourse to the datura powder, and that drugging, though less deadly in its purpose, should become a crime much less easy to be dealt with by the government than Thuggee.

UTILITY AND SAGACITY OF SIBERIAN DOGS.

Of all the animals that live in the high north latitudes, none are so deserving of being noticed as the dog. The companion of man in all climates, from the islands of the South Sea, where he feeds on bananas, to the Polar Sea, where his food is fish, he here plays a part to which he is unaccustomed in more favoured regions. Necessity has taught the inhabitants of the northern countries to employ these comparatively weak animals in draught. On all the coasts of the Polar Sea, from the Obi to Behring's Straits, in Greenland, Kamtchatka, and in the Kurile Islands, the dogs are made to draw sledges loaded with persons and with goods, and for considerable journeys. The dogs have much resemblance to the wolf. They have long, pointed, projecting noses, sharp and upright ears, and a long bushy tail; some have smooth, and some have curly hair; their colour is various—black, brown, reddish-brown, white, and spotted. They vary also in size; but it is considered that a good sledge-dog should not be less than two feet seven and a-half inches in height, and three feet three-quarters of an inch in length (English measure). Their barking is like the howling of a wolf. They pass their whole life in the open air; in summer they dig holes in the ground for coolness, or lie in the water to avoid the musquitoes; in winter they protect themselves by burrowing in the snow, and lie curled up with their noses covered by their bushy tails. The female puppies are drowned, except enough to preserve the breed, the males alone being used in draught. Those born in winter enter on their trainings the following autumn, but are not used in long journeys until the third year. The feeding and training is a particular art, and much skill is required in driving and guiding them. The best-trained dogs are used as leaders; and as the quick and steady going of the team, usually of twelve dogs, and the safety of the traveller, depend on the sagacity and docility of the leader, no pains are spared in their education, so that they may always obey their master's voice, and not be tempted from their course when they come on the scent of game. This last is a point of great difficulty; sometimes the whole team, in such cases, will start off, and no endeavours on the part of the driver can stop them. On such occasions we have sometimes had to admire the cleverness with which the well-trained leader endeavours to turn the other dogs from their pursuit; if other devices fail, he will suddenly wheel round, and by barking, as if he had come on a new scent, try to induce the other dogs to follow him. If travelling across the wide tundra in dark nights, or when the vast plain is veiled in impenetrable mist, or in storms or snow-tempests, when the traveller is in danger of missing the sheltering powarna, and of perishing in the snow, he will frequently owe his safety to a good leader; if the animal has ever been in this plain, and has stopped with his master at the powarna, he will be sure to bring the sledge to the place where the hut lies deeply buried in the snow; when arrived at it, he will suddenly stop, and indicate significantly the spot where his master must dig.—*Von Wrangell's Polar Seas.*

LAZY BEAVERS.

It is a curious fact, says our trapper, that among the beavers there are some that are lazy, and will not work at all, either to assist in building lodges or dams, or to cut down wood for their winter stock. The industrious ones beat these idle fellows, and drive them away; sometimes cutting off a part of their tail, and otherwise injuring them. These 'Paresseux' are more easily caught in traps than the others, and the trapper rarely misses one of them. They only dig a hole from the water running obliquely towards the surface of the ground twenty-five or thirty feet, from which they emerge, when hungry, to obtain food, returning to the same hole with the wood they procure to eat the bark. They never form dams, and are sometimes to the number of five or seven together; all are males. It is not at all improbable that these unfortunate fellows

have, as is the case with the males of many species of animals, been engaged in fighting with others of their sex, and after having been conquered and driven away from the lodge, have become idlers from a kind of necessity. The working beavers, on the contrary, associate, males, females, and young together.—*Audubon and Bachman's Quadrupeds of North America.*

THE RIVER'S VOICE.

BY THE LATE MRS JAMES GRAY.

SUMMER's sunbeams brightly dart
Where the silver waters quiver;
Find a voice, oh happy heart!
In the whisper of that river:
Speaks it not of love like thine,
Of all hues and flowers divine?
Loud the rapid rivers roll,
Winds the bending oak-trees shiver;
Find a voice, impassioned soul,
In the roar of that wild river:
Speaks it not of storms that be
Madly sweeping over thee?
Icy chains the waters bind,
None the prisoners may deliver;
Hear a voice, oh lonely mind!
Even in that silent river:
Speaks it not of fair hopes lost,
Chained in hapless sorrow's frost?
Spring again the currents melt,
Sounding praise unto the Giver;
Mourner, be His glory felt,
Like the sunbeam on that river:
Let the loosened torrents raise
Sounds once more of thankful praise.

THE SHADOW OF AN ASS.

The Greeks had a proverb which ran thus:—'To dispute on the shadow of an ass.' This took rise from an anecdote which Demosthenes is said to have related to the Athenians, to excite their attention during his defence of a criminal, which was being but inattentively listened to. 'A traveller,' he said, 'once went from Athens to Megara on a hired ass. It happened to be the time of the dog-days, and at noon. He was much exposed to the unmitigated heat of the sun; and not finding so much as a bush under which to take shelter, he bethought himself to descend from the ass, and seat himself under its shadow. The owner of the donkey, who accompanied him, objected to this, declaring to him that when he let the animal, the use of its shadow was not included in the bargain. The dispute at last grew so warm that it got to blows, and finally gave rise to an action at law. After having said so much, Demosthenes continued the defence of his client; but the auditors, whose curiosity he had piqued, were extremely anxious to know how the judges decided on so singular a cause. Upon this, the orator commented severely on their childish injustice, in devouring with attention a paltry story about an ass's shadow, while they turned a deaf ear to a cause in which the life of a human being was involved. From that day, when a man showed a preference for discussing small and contemptible subjects to great and important ones, he was said 'to dispute on the shadow of an ass.'—*Newspaper paragraph.*

CHAMBERS'S INSTRUCTIVE AND ENTERTAINING LIBRARY.

Just Published, Part V. of

HISTORY OF THE FRENCH REVOLUTIONS

FROM 1789 TILL THE PRESENT YEAR.

BY T. W. REDHEAD.

On July 1st will be published Part VI., also Vol. III.

Price of the work complete, in Six Parts, sewed, 6s.;
In Three Volumes, cloth boards, 7s. 6d.

Published by W. & R. CHAMBERS, High Street, Edinburgh. Also sold by D. CHAMBERS, 20 Argyle Street, Glasgow; W. S. ORR, 147 Strand, London; and J. M'GLASHAN, 21 D'Olier Street, Dublin.—Printed by W. and R. CHAMBERS, Edinburgh.

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF 'CHAMBERS'S INFORMATION FOR THE PEOPLE,' 'CHAMBERS'S EDUCATIONAL COURSE,' &c.

No. 283. NEW SERIES.

SATURDAY, JUNE 2, 1849.

PRICE 1½d.

A GOSSIP ABOUT FOUNTAINS.

AND first let there be no mistake as to my title. I speak not of fountains made by man, but of fountains made by God. I abjure and repudiate all the tribe of jets and spouts, and flashing pyramids, and circles and domes of gushing water—all the race of stone dolphins flinging the element from their nostrils—of metal Tritons blowing it through shell and conch—and the entire clan of Cupids and Nymphs of bronze and gold pouring limpid treasures forth from dripping cornucopias. All such devices may be pretty in their way—most are so; but I would speak of a quieter, calmer, holier beauty—that of the font which wells forth from the deep places of the earth in drops of liquid crystal—the cradle of the infant stream, exquisite in its unadornment, or mayhap just complimented by some such simple and appropriate rural gift as a rudely-carved channel down the slippery and mossy rock, or a large green fresh leaf cunningly disposed, so as to conduct the living waters fairly and gracefully into the sparkling basin.

I have ever loved water in its almost every shape. Let the beach be what it may, rocky and grand, or slimy and flat, there is eternal variety and glory in the sea—glory whether the white waves come roaring and tumbling to the land, flinging their brine-crests gaily into the fresh eager air; or whether the slow tide creep silently but surely into the brown wrinkles of the level sand, refreshing the salt sea-weeds which have lain since its ebb flaccid and clammy, and giving new life to the tribe of small crabs and shrimps, which, as your foot plashes in the salt pools, bury themselves with one dig in the friendly sand.

As much beauty, too, in another way is there to be sought and found upon the river-bank. I do not mean your navigable rivers, which, after all, are very little better than canals, but the clear stream which sparkles by quiet pastoral meadows, and through green woody ravines, where the fly-fisher often entangles his casting-line amid the leafy boughs which droop across the water; or, better still, perhaps the real mountain torrent—the wild Highland burn—coming raging and roaring from the hills, dashing its way to the loch, or the river in the strath, down a succession of brown, foaming cataracts, and sometimes stopping to rest in great black caldrons of scooped-out rock, where the big red trout lie far down in the swirling pool, farther, perhaps, than you can plumb with your twenty-feet salmon-rod.

And if I try to analyse my love for water in all these forms, I think one principal source to which I can trace the feeling, is the quality of motion so generally possessed by water. Nature moving is always more beautiful than Nature sleeping. The corn never looks so well as when the breeze rustles it; the forest is more

picturesquely glorious when the summer wind causes the boughs to dance, and twine, and intermingle, than when each particular branch grows fixed and rigid, clothed with unwinking and unrustling leaves; the lark, too, is more glorious aloft than crouched amid the herbage. And so with water. No river so uninteresting as those fat, sluggish streams where it is difficult to determine in which way the fabled current moves. Such was Lethe. Canals of course are as bad, but they make no pretences to river beauty. They do their work in floating barges, and there is an end of them. In much the same category, too, I must perforce place the sullen tarn one often comes to amid the hills—a deep, black, cheerless hole filled with water, but from which no burn runs sparklingly, which the ruffling breeze only makes more ugly and wrinkled—a grim, chilly, torpid lump of water, into which you hesitate to plunge on the very hottest summer day, having a vague fear of horrid animals which may live down in the mossy depths—indefinite, abominable monsters—something between horse-leeches and water-kelpies!

From such places, with motion, half or more than half of the charm of water is gone. Comparative vastness avails but little. An unmoving river has no more poetry in it than a tubful of its own muddy fluid standing to settle in the back-kitchen. Of course I do not talk in these disrespectful terms of the shining lake, with its clear waters mirroring rock, and willow, and birch, its mountain streams foaming down to join it, and the sunshine and the cloud making variety upon its broad breast. No: it is your little Dead Seas, your sullen ponds, and provokingly lazy rivers, which excite one's wrath; so that I like to fling big stones to waken up the stagnant torpor of the one, and love to see a quick steamer pass, churning with her paddle-wheels the sleepy masses of the other. Such sluggards ought ever to be soundly shaken: although you only succeed in stirring them up for a moment, it is some satisfaction to know that you have broken their lazy rest.

But there is one development—the infant development of water—which possesses almost an epitome of the grace and living beauty which we find in the fresh stream or the salt sea. It is the fountain, the well, the spring-head, the very shrine of the young water, where it comes bubbling into the sunlight from the unknown depths of the earth. The motion of water is, as I have tried to show, that which gives it charm, which gives it life. Here, then, is the beginning of the motion, of the charm, of the life; here is the cradle of the young existence; and as infancy is holy, and pure, and undefiled by a world into which it has but just come, so is there a certain sentiment of purity, a certain deep holiness about the welling fountain.

Ever since I can remember myself, I can remember that I had a sort of instinctive reverence for a quiet,

pure spring. I think I must have had some vague perception of the feeling which in the last paragraph I have endeavoured to express. I always had a notion, perhaps never then sought to be clothed in words, that fountains were, I was going to say haunted, but I ought to say holy places; that there was some invisible Presence near them, which cooled the air around, and spoke in the gurgle of the water. Nothing in the way of a grisly phantom; no ghost. No: only the water-spirit—something to admire, and yet to be in awe of. A pleasing half-conscious awe, yet still distinctly existing; distinctly enough, for example, to have kept me, had I ever been so inclined, from rudely disturbing the water, or seeking to pull asunder the mossy and splintered ledges of rock through which the young stream came dancing up into the clear basin; from which, again, it trickled out through the green fresh herbage into the warm open sunshine.

And this feeling must be general: it must be experienced by plain country-folk who never heard of a Naiad—by solitary shepherds and herdboys, who, when they pile grottos and carve runnels and basins in honour of the fountain, do ignorant homage to that creative imagination which framed the tale of Arethusa, and moulded out of the sunny Grecian air the beard, and the urn, and the majestic presence of the river-god.

You seldom or never find a fountain in Scotland which has not a local name—few which have not their local traditions—and in many of these the idea of a presiding and conscious Genius of the Well is curiously and clearly acknowledged. There is a story attached to a fountain not far from Cromarty, which has always struck me as being conceived in a spirit of as exquisite poetry as vivifies and flushes any legend ever sung in the Ionian tongue. It was a hot summer, and a peasant approached to drink at the grateful source: as he rose refreshed, he saw a neighbour whom he hated approach hot and flustered, his eye fixed upon the cooling waters. With an exclamation of spite the churl seized a handful of gravel and dashed it into the sparkling basin. Instantly, and with a low subterranean murmuring, the insulted water sunk back into the earth, and the enemies stood glaring at each other over the empty and polluted well! Days passed, and the aggressor became uneasy as he reflected upon the insult which he had offered the sprite of the font; so, having consulted a seer, he repaired to the spot, knelt at the spring-head, and cleansed the basin with a fair linen cloth. The expiation was accepted: the subterranean murmur sounded as before, and the live waters leaped up again from the earth! But mark the sequel; and herein lies some of the grace, and all the moral of the story:—The fountain having signified that the atonement was not without its fruits, again ceased to flow; and ever afterwards it has only burst forth in the wet and cheerless time of winter, disappearing in the earth when the summer days grow long, and the sun is hot and the soil baked, and man and beast anxious to slake their thirst.

But how can we wonder that man, amongst the hills of the Morea, or amongst the hills of Scotland, agreed in attributing godlike life to the fountain? The Naiads, after all, were the most beautiful and poetic of the subsidiary spirits of the Greeks. The Dryads, who peopled the woody ravines and breezy uplands, were beautiful, buxom, and gay; but they had something coarse and animal in their composition. They danced with the goat-footed Satyrs to the rude pipings of Pan, and, with

the Bacchantes, held open their ruddy lips to catch the luscious squeezings of the grape. But the Naiads were spirits of another sort—filmy and aerial—graceful as the gliding of the waters they inspired—soft-singing as the lullaby of the streamlet over whose cradle they hovered. Minerva was not more pure, or Venus more beautiful. The musing Athenian might deem that he caught glimpses of the flushed fleeces and bronzed limbs of the Dryads and the Fauns gleaming through the woody brake; but if his fancy saw the Naiad, she was rising like a delicate white exhalation from her crystal home; or if he heard her voice, it was as though the font were speaking by its waters, and as though the gurgling of the well had become articulate in the language of Orpheus and Hesiod.

There was a fountain near my native town in the north of Scotland which is indissolubly connected with my first glimmerings of memory, and which had always a strange mysterious awe for me; the causes of which I can yet only partially divine. It always seemed to me that an animating Presence dwelt in the quiet grove in which that fountain rose. I had vague fears of entering it alone, even at hot noontide; the spot was so shady, and solemn, and still, and the living waters gushed forth with so musical a gurgle. Let me try to bring back the scene:—The spring lay in a remote nook of extensive grounds appertaining to an old castellated mansion-house: the proprietor was an invalid, almost a recluse; and both house and grounds had a lorn and deserted look. The grass grew rank in the lawns, weeds choked up the fish-ponds, the woods were unkempt and shaggy, and in the low grounds the overflowings of a stream made patches of luxuriant marsh, where the woodcock loved to haunt in summer, and whither the wild duck resorted in spring from the neighbouring sea. The whole spot wore an air of beautiful desolation. Few people frequented it. The townsfolk had no feeling for the particular sentiment of the landscape, and only now and then the figure of an old servant of the family would be seen traversing the half-choked-up paths, or wading through the rank waving grass under the old trees.

In a sequestered corner of these grounds was my vaguely-loved and vaguely-dreaded fountain. You left the white dusty highway, pushed open a rusty iron gate, the decaying bars of which formed the initials of the owner's name, and following a belt of planting, and seeing on one hand rustling fields of corn, and on the other gently-swelling meadow-land, you came to a little grove of birch-trees. At some little distance rose a steep craggy hill, the gray rocks looming out like bald places amid the sombre firs. On the summit was one of the most striking vitrified forts in Scotland, where, ages ago, those great bale-fires burned—kindled how or why we know not. But in the little grove sprang my fountain. You could trace it by the tiny streamlet which freshened the grass, and nourished the broad water-plants as it passed. The fountain was enclosed in a grot. Two great slabs of gray whinstone sheltered it on either side, and it was roofed over with a third. Beneath was the oblong basin of clearest water; and at the back, issuing from a cleft all overgrown with velvet moss, came bubbling up the waters of the spring. The roof slab was a massive one, and upon it—on the lintel, as it were, of the fountain—were carved in deep narrow letters some half-dozen lines of poetry; an invocation addressed to the 'Nymph of the Grot.' I can now recall only broken fragments and jingling remnants of the lines; but they were, I think, the spell which first made the spot a holy one in my mind. They recognised the existence of a Goddess of the Grove; they addressed her; they recommended silence and reverence near the shrine; they thanked the Nymph for her bounty; and on the part of the thirsty, they blessed her for the cooling waters she bestowed. These lines had something to me of awful yet beautiful import. I vaguely believed them. They were, if I may use the expression, the Bible of my faith in the Spirit of the Well. And beneath them was carved a Latin distich, which was another

source of awe and mystery; because I am speaking, not of schoolboy times, but childhood's times. In after-days I could, I hope without much difficulty, construe the line—that simple, beautiful, ever fresh, and dewy form of words—

‘Amem inglorius flumina silvasque;’

But then the great power of the charm had departed. I drank of the well if I were thirsty—indeed, like most boys, I always drank at a well whether I was thirsty or not—but although I knew all about Naiads and Nereids, I cared nothing for them, and only associated them with school-hours, Latin versions, and Adam's ‘Roman Antiquities.’ It was the child, not the boy, who was the fountain-worshipper. How vague, yet how sweet, is the memory of the sultry afternoons I have passed within sound of that rising water—that sound which was at once a liquid gurgle and a low tinkle, as of lightly-smitten silver! Beside that noise there was no other. The afternoon sun came sprinkling down through the trellis-work of boughs and leaves, and upon the gray mossy slabs, lighting and warming them. But within the grot there was no sun. Here lived the cool twilight of the water-sprite's house. You could kneel down, and, as it were, put your head through the wide opening into her dwelling. It was leaving the summer and the summer air behind. How cold, and pure, and solemn was the simple temple, with its floor of fairest water! And here the murmur of the spring was almost loud, clear-voiced, and jocund. But it sounded more in unison with the calm beauty of the place, with the shade of the stately trees, with the massive walls of the grot, with the solemn invocation uttered perpetually there by the silent yet speaking stone, when you listened to it from without: and when, sunk in the soft arms of a summer day's dream, you lay upon the sward, and with half-open eyes watched the clear water coming out of the deep-brown shade, and almost fancied, as your glance strayed from the quaint poetry which hailed the Nymph, and your mind drunk in the shadowy solemnity and stillness of the place, that the dim *genius loci*, whose invisible influence you felt, would rise from the recesses of her well, the tender vision of a filmy form, and stand upon the water-floor of her palace, lovely, yet awful to flesh and blood—a thing of the water and the air—a painted fancy—the visible echo of your own sweet dreamings! A. B. R.

ANOTHER AFFAIR OF HONOUR.

I AM reminded, by a recent article in the Journal, of the single combats which in former times were wont to defile the green turf of my native island. Of course I need not name that island: the two simple ideas of ‘fighting’ and ‘green’ will infallibly suggest to the least logical intellect in Great Britain a compound one representing the locality intended. But although the progress of civilisation in my country has, through many painful causes, been wofully retarded, yet there is some comfort in reflecting that the enormity of duelling may now be classed among the things that ‘have been, and are not.’ I will, however, for the amusement of my readers, relate the history of an affair of honour which took place in a district of Munster some sixty or seventy years ago.

Albeit a wild locality, so far as the natural features of the landscape were concerned, yet the vicinity of Barnagore, as, for the double reason of concealment and euphony, I shall call it, was a tolerably peaceable place, viewed with respect to its inhabitants. Barring the occasional beating of a tithe-proctor, or ducking of a sheriff's officer, the country for miles around the village which gave it a name was singularly free from agrarian outrage. The land was divided into moderately-sized estates, each supporting the hospitable mansion of a country gentleman, with his good-natured wife, and

their handsome rollicking progeny. During a long series of years various intermarriages had taken place between the several families; so that, at the time I write of, there was scarcely an individual of note in the country who could not claim cousinship with each and every one of his neighbours. One gentleman there was, however, who was wholly unconnected with the magnates of the district. He was a Mr Fooks, a rich old bachelor residing in a very pretty cottage close to the boundary hedge of a large estate which had lain for some time unoccupied. The dwelling of Mr Fooks stood in the midst of a beautifully-cultivated pleasure-ground, a wilderness of sweets, where the emerald turf of the lawn was soft, and rich, and smiling, as though it lay in the heart of England's sunny Hampshire. A kind man was Mr Fooks; beloved by the squires, with whom he never quarrelled, when, in the heat of the chase, following the hounds in full cry after Reynard, they trampled his harvest-fields. He was beloved by them, I say, notwithstanding his uniform desertion of the dining-room after the first magnum of claret had gone its rounds; a grievous dereliction from the rules of good-fellowship, which would not have been easily pardoned in any one else; but Mr Fooks was a privileged man, and, as the ladies were wont to remark, ‘it was really a comfort to feel sure of having *one* gentleman steady on his legs in the drawing-room, so that one might venture to give him a cup of coffee without the chance of having half of it spilled on one's best satin.’

With the young people he was an especial favourite. No better partner in ‘Sir Roger de Coverley,’ or merrier opponent in the game of ‘Matrimony,’ could be found in the entire county; while his skill in making ‘hurleys’ for the boys, and carving wooden babies for the girls, secured for him a widespread popularity among the rising generation. By common consent he was known in the neighbourhood as ‘Holy Fooks;’ and this epithet was bestowed not in ridicule, but as a sincere acknowledgment of his singularly blameless and useful life. Perhaps it was also meant to commemorate a peculiarity in his character—he was never known to fight. From the tithe-proctor, whom he hospitably entertained and regularly paid—an unprecedented line of conduct, which caused that much-enduring man to exclaim, ‘Sure Barnagore would be a heaven upon earth if every man in it was like Holy Fooks’—from the tithe-proctor down to the urchins whom he often caught snaring hares or cutting sticks in his wood, he never abused or quarrelled with any one. Yet Holy Fooks was no coward; that the poor widow at the mill could testify, whose fair-haired boy he saved from drowning by jumping into the mill-pond at the imminent risk of his life. And when Tom Maloney's house was burned, who but Holy Fooks could be found to tread the falling floor; and while with one hand clinging to the blackened rafters, with the other to seize in succession three children, and hand them safely to those outside? Mr Fooks, in short, was that, I grieve to say, anomalous character in Ireland—a *brave good man who would not fight!*

The estate which bounded his had lain, I have said, for some time unoccupied; but at length a tenant for it appeared in the person of a professed duellist from Tipperary, who, having made even that fiery locality too hot to hold him, and possessing as much money as impudence, resolved to settle at Barnagore, and break fresh ground among its quiet inhabitants. Tom Magennis, for such was his name, had not been long settled in his new residence ere he managed to establish several ‘very pretty quarrels’ with his neighbours. He was an unerring shot, seldom failing to kill his man at any number of paces, and was as prone to take offence as the infamous Fighting Fitzgerald. He challenged one young gentleman for accidentally touching him with his whip as they were leaping together across a stream while following the hounds. All attempts at a reconciliation were rejected by the scornful bully: they met;

and an hour afterwards a fine lad, the hope of his house, was carried home a lifeless corpse.

The neighbouring gentlemen tried to send Magennis to 'Coventry,' but it would not do; he was a man of good family, and contrived to maintain his position in society literally at the point of the sword. Every one wished him away, but who was to 'bell the cat?'

It happened that a small field belonging to Mr Fooks lay next the upper corner of Magennis's lawn, to which the latter wished to have it annexed; he accordingly wrote a letter, couched in a very high and mighty style, requiring his pacific neighbour to sell him the piece of ground in question. A polite reply in the negative was returned; and Magennis, boiling with rage at having his will opposed, hastened to seek an interview with Mr Fooks. He found that gentleman seated in his pleasant parlour surrounded by his books; and after the first salutations had passed, Magennis began abruptly:—

'Mr Fooks, am I to understand from your letter that you refuse to let me have the lawn field?'

'Certainly, sir: I have no intention whatever of parting with it.'

'But I tell you I want it, and have it I will.'

'I should be sorry,' said Mr Fooks mildly, 'to disoblige a neighbour; but I am sure Mr Magennis will see the impropriety of pressing the matter further, when I repeat that I am quite determined not to sell the field.'

'You wont sell it?'

'No, sir.'

'Then,' said Magennis with a fearful imprecation, 'if you don't give me the field, you shall give me *satisfaction*; and maybe I'll find your "heirs, executors, administrators, and assigns" easier to deal with than yourself.'

A quiet smile passed over the countenance of Fooks.

'Do you mean, Mr Magennis, that you wish me to fight a duel?'

'Certainly: name your friend, and I'll send mine to meet him.'

'I am not much versed in these matters,' said Fooks; 'but I believe, as the challenged party, I have a right to select the weapons and the place of meeting?'

'Oh, certainly; nothing can be fairer. Choose what you like, my boy: the sooner the better.' And the bully rubbed his hands with delight at the prospect of slaying another man.

'Then,' said Mr Fooks, 'I wish to dispense entirely with seconds, to fight on horseback, and to arrange that each of us can come armed with whatever weapons we may choose. Let the place of meeting be the wide common between the school-house and the mill; the time twelve o'clock to-morrow; and let him who is first driven off the field be declared vanquished.'

'Queer arrangements as ever I heard,' said Magennis. 'Why, my good fellow, don't you know that if I come armed with a long sword, and mounted on my hunter Highflyer, I'll ride you down and spit you like a lark before you can say Jack Robinson? However, that's your look-out, not mine; so of course I agree to what you propose, and have the honour to wish you a very good-morning.'

He then walked away, marvelling much at the coolness of his antagonist, and thinking what fun he would have on the morrow. Every one he met was told of the jest, and invited to witness the combat. Great was the consternation caused by the news throughout Barnagore.

'To think,' said Mr Penrose, one of the chief landed proprietors, 'that our own honest Holy Fooks, who would not willingly offend a worm, is to be slaughtered by this scoundrel; it mustn't be. I'll go to him, and offer to fight in his stead.'

Accordingly, he repaired to the dwelling of Fooks, and found that gentleman as tranquilly occupied with his books as when he was visited by Magennis in the morning.

'A bad business this, Fooks,' said Mr Penrose; 'a very bad business. Why, man, rather than you should meet Magennis, I'll fight the rascal myself.'

'Thank you, my friend,' replied Mr Fooks: 'I feel most grateful for your kindness; but since Mr Magennis has chosen to take causeless offence, I have resolved to give him the meeting he desires. Perhaps,' he added, smiling, 'the result may be better than you expect.'

'Oh, my dear Fooks,' said his friend, 'don't, I beseech you, build on *that*. The fellow is a regular assassin, and if he had his deserts, would long since have gained promotion at the hangman's hands. However, there will be a score or two of your friends on the ground to see fair play, and have satisfaction from him for your death.'

With this somewhat equivocal piece of consolation, and a hearty shake of the hand, Mr Penrose took leave of his friend, who, during the remainder of the day, stayed within doors, and declined seeing any visitors. On the following morning a large concourse of people, including, indeed, nearly every inhabitant of the parish, assembled on the common to witness the approaching combat. Long and loud were the lamentations of the poorer people, who had experienced much kindness from Mr Fooks, at the fate which awaited him; while the deepened tones and darkened looks of the gentlemen testified their sympathy with him and their abhorrence of his antagonist. Precisely at twelve o'clock Magennis appeared on the field, mounted on a splendid blood-horse: a dagger was stuck in his belt, and he brandished an enormous two-edged sword in his hand. He cast a scornful glance around, and not seeing his opponent, exclaimed, without addressing any one in particular, 'I thought the cowardly fool would be afraid to meet me; but if he sneaks away, perhaps one of his *friends* (with a sarcastic emphasis) will take his place.'

'Here he comes himself!' cried a boy, throwing up his hat, and a general cheer announced the approach of Holy Fooks.

He advanced rapidly, mounted on a Kerry pony of so diminutive a size, that its rider's feet were but little raised above the ground. He was completely enveloped in an ample crimson dressing-gown, which waved and flaunted in the breeze after a singular fashion. In his right hand he bore something which had the appearance of a very long lance; but which, having both extremities covered by the extended folds of the dressing-gown, was not as yet clearly visible. With his left hand he shook the bride, and urged his tiny steed towards the spot where stood the astonished Magennis.

Whatever the latter gentleman may have thought of Mr Fooks's costume, his mettled horse seemed to have formed his own private opinion on the subject; for no sooner did the gaudy dressing-gown flaunt beneath his eyes, than he started, shied, and began to prance in a manner which caused his rider to exclaim, with an expletive too forcible for transcription, 'What's the meaning of this buffoonery? Come on, man, and meet me like a man.'

'Always happy to oblige a friend,' said Mr Fooks; and suddenly throwing back the offensive garment, he raised his weapon, and shook it full in the face of his adversary. It was a long slender pole, having at one end a distended bladder containing some dried peas. A fearful thing it looked in the eyes of Highflyer; and so appalling to his ears was the rattling noise it made, that despite the furious efforts of his master, he fairly bolted, turned tail, and galloped at full speed across the common. After him rode Fooks, shaking his rattle, and shouting, 'Come back, Mr Magennis! come back! 'tis a shame for you, man, to be afraid of a dressing-gown and a child's rattle!'

But faster and faster flew the affrighted horse, bearing his enraged master beyond the sound of the inextinguishable laughter which hailed his defeat and the bloodless triumph of Holy Fooks. The bully had not courage to return to the county and brave the merciless ridicule which awaited him. He disposed of

his property, and retired to England, where he was compelled to live in peace, as his neighbours soon learned to appreciate him, and declined to indulge his propensity for fighting. Yet the few persons who continued to associate with Mr Magennis were often puzzled to account for the transport of rage which possessed him whenever the slightest allusion happened to be made in his presence to dried peas, Kerry ponies, or crimson dressing-gowns.

PERIODICAL PHENOMENA IN THE VEGETABLE KINGDOM.

At the meeting of the British Association in 1842, Professor Quetelet of Brussels threw out some suggestions relative to various natural phenomena, which, there was every reason to believe, would prove in many respects of high value if brought under an extensive and combined system of observation. For a few years previously, the attention of scientific men in different parts of Europe had been directed to the subject, and the results were published in the 'Memoirs of the Royal Observatory at Brussels' and other places. The phenomena in question are immediately dependent on meteorology. Investigations in connection with them had frequently been made, but with no attempt to study them as a whole, or to determine the laws by which they are governed; and the object proposed was the establishment of a series of observations on the vegetable and animal kingdoms, wherever co-operators could be found to undertake the necessary labour.

A brief summary will show that the inquiry would prove far more interesting than might at first sight appear. If the temperature of the years were determined beforehand, and a certain degree of heat or cold, moisture or sunshine, allotted to every week, day, and hour, the phenomena dependent on these effects would be everywhere the same, and we should be able to predict to a day the time for gathering cherries or reaping wheat. We find, however, that plants do not reappear and germinate at identical epochs. There is a certain mean, or medium point, round which heat and cold, dryness and moisture—all the elements, in fact, which go to make up what we call weather—appear to move; and on the greater or lesser degree of these movements, or oscillations, depends the advance or backwardness of vegetation. According to M. Quetelet, the existence of the smallest aphid, of the most insignificant insect, is dependent on changes in the existence of the plant by which it is nourished; and the plant itself, in its gradual development, is in some measure dependent on all previous changes that may have taken place in the soil and atmosphere. The observations would naturally apply to the annual and diurnal periods of plants. The annual period is the space of time comprised between two successive returns of leaves, flowers, or fruit: the diurnal period brings round the hour of the day or night when the opening or closing of certain flowers takes place; which, it may be presumed, would be always the same in the same locality. It is only by a combined system of observations, to be carried on at numerous places to be agreed on, in different countries, that the inquiry can become of real practical value. One single plant, studied with care, would furnish most interesting results. We should then be able to specify the places where the leafing of the plant was observed to commence on the same date; and so of flowering and the appearance of fruit. Lines drawn to connect these places on a map would be called *synchronous*, or lines of *equal time*. The next point would be to ascertain whether these lines were equidistant from each other, and what relations would exist between them and the isothermal lines, or lines of equal heat, which have been laid down with tolerable correctness over the whole globe. And lastly, would the *isanthesic* lines, or lines of simultaneous flowering of the plants observed, be always at regular or parallel distances from the lines of foliation and fructification?

By observations on the animal kingdom, it was considered that the data would be increased in value, as temperature plays an important part in the migrations of birds and colour of animals. Hitherto, however, little or nothing has been attempted beyond the study of plants. The variety and magnificence of flowers are such, that observations on the phenomena they present must be a most delightful labour, divested of all wearisomeness. It is important to notice the difference of colour and odour in different latitudes. The inhabitant of the north, on travelling to the south, is always struck by the increase in these respects. Warm climates favour the development of essential oils: in the north, the oleander has a scarcely perceptible scent; but at Naples it exhales a powerful perfume. 'The seasons,' pursues the professor, 'have marked effects upon the colours of leaves and flowers, the latter more especially. At the end of winter white predominates among the tints of the corollæ, to be followed by deep and vivid dyes, that fade in autumn.' The temperature of the earth, particularly of the layers penetrated by the roots of trees, merits especial attention. It would be interesting to follow the diurnal fluctuations of three or four thermometers, whose bulbs should be equidistant, in a vertical line, the upper one immediately under the surface, the others from one to three feet below. Two series of such thermometers, in the sun and shade respectively, have for some years been regularly read off in the garden of the observatory at Brussels. The pursuit of this inquiry promises interesting results not only for meteorology, but for geographical botany. It is somewhat remarkable, that while the opening and closing of many flowers shows them to be greatly affected by solar influence, others, on the contrary, appear altogether insensible—a peculiarity which has led to more frequent observation of solar radiation. Although the amount of influence due to each element of growth cannot yet be determined, it is evident that temperature is the most important: its influence on the organisation of a plant is that of a vital force, and must be estimated in squares of the degrees. Two spring days, at a temperature of 50 degrees, are not equal to one of 70 degrees; the effect of the latter would be more than double that of the two former.

A country whose winters are mild, notwithstanding a high latitude, may produce flowers earlier than other countries in a lower latitude. On comparing the western coast of England, for example, with France or Lombardy, snowdrops and crocuses are found flourishing in full vigour before they are ready to open at Parma. But as the temperature increases with marked differences of intensity, an equilibrium is soon established, and the southern regions, in their turn, take and maintain the lead. The period between foliation and flowering would also be less long in Italy and Spain than in England. M. Quetelet considers that, as a general rule, plants in the neighbourhood of Brussels wake from their winter slumber from the 25th to the 27th of January. The farther, however, that we go from the sea towards the interior of continents, the lower is the temperature: islands, as is well known, have a milder climate. The hazel buds in London about the 4th of January, but in Brussels not before the 26th of February—a difference of fifty-three days. The *crocus vernus* appears in London on the 3d of February, in Brussels on the 21st. The greater mildness of the English winter gives London the precedence at the commencement of the season, but it soon diminishes. In March it is only twenty days; in the first half of April, four days; but from the 15th April to the end of June, Brussels is from seven to eight days in advance of London. Extending the comparison to a more northern locality (Stettin), the advantage at starting in favour of London is nearly double that over Brussels; but in July and August, Stettin and Brussels are from five to six days in advance of London. According to observations made at Sir T. M. Brisbane's observatory near Kelso, the period of foliation in that vicinity is two days in advance of Brussels. A comparison of

periods of flowering with those of Parma shows a retardation of six days at Zurich, thirteen days at Tübingen, twenty-five days at Berlin, thirty-three days at Hamburg, and at Christiania fifty-two days. There are, however, some curious exceptions to the general rule; near Geneva there is a large chestnut-tree, which puts forth leaves and blossoms a month earlier than other trees in the district, without any apparent local cause to which it can be traced. Another, in the garden of the Tuileries, is named, from its early leafing, *the Chestnut of the 20th March*; and at Baarn, near Utrecht, an oak, which has been observed for fifteen years, anticipates other trees by a fortnight in throwing out its leaves, without losing them earlier in the autumn.

A degree of latitude corresponds approximatively with a difference of four days in flowering. Some anomalies, however, remain to be cleared up. Between Christiania and Hamburg the difference is three days; but between the south of Germany and Smyrna it is seven days; between Naples and New Jersey, both in the same parallel of latitude, the difference is two months. An elevation of one thousand feet in our latitudes is equal to a delay of fourteen days in the epochs of vegetation. A diurnal variable temperature, all else being equal, is more favourable to vegetation than a uniform temperature. It has been observed in the orangeries of the king of Prussia, at Berlin, that the cold to which they are exposed during the winter is rather beneficial than otherwise; and at Astracan, where the thermometer falls from 30 to 40 degrees below zero, the grapes are remarkable for their rich and delicious quality. It will thus be seen that forwardness of vegetation is not a constant characteristic; that which is true at one season of the year is not true at another. The revivification of plants commences with the cessation of frost, which in our climate lasts for three or four months; and the period of foliation may be comprised between the first great movement of vegetation and the covering of the plant with leaves, at about the end of April, from which time to the first half of July is the flowering period; that of fructification, from the 15th July to the fall of the leaf. The latter process depends as much on the actual temperature, as on that which has preceded. In our latitudes the leaves generally fall with the first autumn frost.

In observing plants, care should be taken to exclude closely-related species, which it might be difficult to distinguish; annuals and biennials are also, for obvious reasons, to be avoided; the selection should be made among perennials or woody plants, which exhibit the influences of the soil as well as those of the atmosphere. The cerealia, sown in autumn, as the most widely-cultivated of plants, and the most essential to human existence, are especially deserving of attention—the object being to determine the exact time at which the ear appears. In Tournay, it is an axiom among cultivators that ‘April never passes without showing ears;’ and the ascertaining of the various periods for the whole of Europe will, it is anticipated, lead to the formation of data highly interesting in an agricultural point of view. The ripening of grain appears to be mainly dependent on a high autumn temperature. At Yakoutsck, on the confines of Siberia, where the temperature is above zero during four months of the year only, rye is grown. According to Sir George Simpson, the temperature, which in summer is 106 degrees, falls in winter to 83 degrees below zero. The long day of the arctic regions compensates for weakness of solar action; and although snow frequently falls on the last sheaves, the crop is generally good. On one occasion, the soil was dug into after the carrying off the grain, and was found so hard frozen at seven feet beneath the surface, as to be impenetrable by the ordinary instruments. At other places in the same country, lying more to the south, and apparently in a more favourable position, grain cannot be grown, in consequence of the lowness of the temperature in autumn.

The lines of equal temperature drawn through Europe correspond in a remarkable degree with those traced for the summer rains, which, in their turn, have a material effect upon the growth of plants: countries unfavourably situated in other respects will, from this cause, produce a greater number of plants than countries in which rain falls more rarely. Drought, in most instances, has the same effect as cold in retarding vegetation: in the equatorial regions it produces all the effects of winter.

With regard to flowers, many interesting points remain for further consideration—In what consists their dependence on solar light—on the amount of moisture in the atmosphere? Why do some open in the day, or at certain hours, and others at night—some only when shone upon by the sun, while others under similar circumstances close, although of the class which open by day? Do the leaves close when the flowers open, or *vice versa*? And what is the relation between the colours of flowers, and the times at which they appear? Such are a few of the questions yet to be solved with respect to the periodical phenomena of plants.

The action of the sun appears to be both positive and negative: positive to the opening, and negative to the closing flowers. In this way the organic force of the leaves, &c. is excited and polarised, the effect of which would be to open and shut the various parts alternately. From a series of observations, extending over several years, made at Prague, it is found that flowering plants grow more abundantly on a level surface than on a slope. A conical hill, exposed on every side to the sun, and planted with flowers, would show a decrease in their numbers from south-east to north-west, and an increase from north-west to south-east; these two points representing the maximum and minimum. A southern slope is the most desirable; east comes next in order; then north; and lastly west. The south and south-eastern slopes receive more of the sun's rays, are deprived of their redundant moisture, and are in full enjoyment of the vivifying effects of heat and light, long before the sun reaches the west. The plants towards the latter quarter, consequently, are developed under different circumstances; subject, however, to great modifications, from the prevalence of westerly winds. The number of flowers in sunny situations is three times greater than when in an indifferent or shaded situation.

Some dependence has been traced between the colours of flowers and the time of the year at which they appear. Yellow tints predominate in the autumn, and varieties of white in spring. Taken in the following order—white, yellow, orange, red, green, blue, violet, indigo—there is an increase from January to July, and a decrease in the last half of the year. White flowers are the most numerous throughout the year, yellow come next, and the others follow in the order above enumerated; indigo being the most rare. The proportion of flowers which open and shut is greatest among the yellow, somewhat smaller in the white, diminishes largely in the red, and is least among the blue. White flowers increase rapidly from January to the vernal equinox, less rapidly from March to the middle of May, after which period they decrease; the greatest increase of yellow flowers is from April to June. Red flowers, which are rather more numerous in February than in April, increase from the latter period to September, and diminish in October and November, when red is perhaps the only colour visible. In these phenomena there is a manifest dependence on the rise and fall of the temperature.

In representing these effects by coloured lines on a diagram, in the same way that the fluctuations of the barometer are represented, the curve line of each colour rises twice to a positive and a negative point—one descending, while the other ascends. The effect is seen most clearly in the white and the yellow: the first positive point of the white, and the first negative point of the yellow, both fall in January; the first negative of

the white, with the first positive of the yellow, in March; the second positive of the white, with the second negative of the yellow, at the beginning of May; and lastly, the second negative of the white, with the second positive of the yellow, in October. In March the two curves almost touch each other, are widest apart in May, cut each other in August, and run nearly parallel for the remainder of the year. White, red, and yellow are thus seen to be the colours that offer themselves most favourably for observation.

The further investigation of these interesting questions, on which observers are most diligently at work upon the continent, is pregnant with many valuable results for future use and publication. Professor Quelet's suggestions have been carried into effect at about fifty different places, and on the accumulated observations of six years the ascertained data are based. These briefly resumed, are—first, that temperature is the most active among all the causes by which the periodical phenomena of vegetation are influenced in our climates: the progress of vegetation is equal to the sum of the temperature: frosts, when not in excess, so as to alter the constitution of a plant, cause no sensible delay in their ulterior development, and variations of temperature promote vegetation: isanthetic lines, or lines of simultaneous foliation, are not parallel; in the course of a week, the zone between two series of places becomes of unequal width, and inconstant: the law by which they are to be expressed remains to be discovered.

SIERRA LEONE.

SOME time ago the public were amused, if not instructed, by a paradox called the 'White Man's Grave,' in which it was maintained that Sierra Leone was an agreeable and healthy, though somehow or other an always calumniated place. People were at a loss to know how the author contrived to get over the trifling obstacles of statistics; but by a new work on Sierra Leone, we see clearly enough the solution of the mystery.* The truth is, this African paradise is delightful—for a little while. Its scenery is as beautiful as can well be imagined, and it presents so many objects of interest and novelty, that one has no time to fall sick. In this position the new resident cannot conceive what people mean by finding fault, and is angry with the enemies of so enchanting a spot; and the Lady, to whom we now present the polite reader, expresses her great sorrow at the alarming reports she sees in the newspapers respecting a climate which is growing healthier and healthier every day, as the trees are cut down and the bush cleared. But this is in Part I. of her Journal. In Part II. (having had severe and continued illness) her tone is a little different. She wonders how the author of the 'White Man's Grave' can paint so much *en beau*, denying even the extreme insalubrity of the climate. To be sure he was only a few weeks in the place, or he would have seen what this lovely land really is, and have agreed with Chamier and herself that the climate is *the worst under the sun*.

Previous to 1835, the period of service before a retiring pension could be obtained was six years, and two commissioners actually survived to make the claim; but the term was subsequently altered to eight years, and since then not one shilling has been drawn on this account. As for the commissioner's clerks, who have twelve years' broiling to undergo, the pension as regards them is as unreal as a vision of the night. When the Lady heard of the death of a resident who had called on her shortly before in perfect health, she was much shocked. But this was during her novitiate. Tidings

of the kind soon came too thick and fast to make much impression; and 'the surprise,' she tells us, 'has long been, when any one recovers.' She once sent to inquire at what time a merchant vessel, by which she desired to write, would be ready to sail for England; and the reply was, that the *Ann Grant* had been laden for some time, but could not come down the river, *all her hands being dead!*

The first sight of the fatal shore would convey very different impressions:—'As soon as daylight streamed in at the little window of our cabin, I looked eagerly out, and saw fantastically-painted buildings glittering in the glorious light of a tropical sun, and beyond, the lofty mountains of Sierra Leone. Through the faint shadowy haze their verdure appeared more soft and beautiful than that of the foliage near us, which flashed on the eye with a supernatural tint, and formed a striking contrast to the deep cornelian colour of the earth in the paths and banks of the river—the whole landscape conveying the idea of a perpetual summer.' The spot on which she landed was extremely picturesque:—'Fancy a very small and secluded opening into the land—the waves rippling against loose masses of rock covered with white gulls—the steep red bank above bordered to the very water's edge with green boughs—the thatched roofs of one or two native huts peeping out from among the bright foliage, in which the shady leaves of the banana and plantain were most conspicuous—while a long flight of roughly-built stone steps (up which our path lay) marked the former landing-place to a ruined house, close enough to form a picturesque feature in a place, the soft quiet beauty of which reminded me of the paintings of Poussin and Claude.' Then came the tall black figures that flitted past her—the gorgeous trees and flowers—the richly-plumaged birds—and, when darkness set in, the hum of myriads of insects. The visitor felt better in health as the day wore on; she fancied the air possessed a sanatory influence; and she suspected the appalling stories of the climate to be the inventions of envy!

Our Lady is a good painter of minute objects, but she wants breadth: her pencil is feminine, and addicted to stippling, and reminds you, by its neatness and colouring, of the effect of a kaleidoscope. Here is a notion, however, of the general aspect of one of the localities:—'There are three distinct phases of the landscape here. The first is hill and dale, clothed in all their original exuberance of stately forest, and appearing in their primeval grandeur, as it were, fresh from the hands of their Maker; the second is the first denuded and laid waste by fire and hatchet, as are now the greater number of the hills in this locality, and that is the scenery I would gladly see changed; the third is the second rich in partial cultivation, and which, with the first, constitutes the peculiar beauty of the tropics, and in it I certainly desire no variety. Here fruits and flowers, which attain to but a dwarfish height when coaxed in our home hothouses, spring up and flourish spontaneously in all their own native loveliness. Setting aside the many graceful scions of the acacia tribe, from the noble locust-tree to the slender shrinking mimosa—overlooking the queen-like palm, with her not less regal sister the feathery-branched cocoa-nut-tree—here the broad-leaved plantain and banana form a natural arcade that breathes of coolness even under the sun of Africa; there the pawpaw raises its slight shaft, which you wonder can support the green and golden load at top, while its yellow blossoms perfume the air, and form the centre of attraction to a flock of bright-winged humming-birds. But it is not *here* and *there*. Mingled in one rich mass of harmonious colouring, and flinging their sweet scent to the welcome sea-breeze, orange and lime-trees, spangled with snowy flowers, and bending under the weight of their gorgeous fruit, vie with those of the luxuriant mango, the bay-leaved coffee, the pale-stemmed guava, the dark densely-foliaged rose-apple, the sour-sop, with its orchard-tree aspect and portly produce, upon our own pretty little hill, that boasts of

* A Residence at Sierra Leone. Described from a Journal kept on the Spot, and from Letters written to Friends at Home. By a Lady. Edited by the Hon. Mrs Norton. Murray's Home and Colonial Library. London: Murray.

many hundred others in the bush, whose names I cannot tell.

Among the trees is a wild fig, admitting a chequered light through its widely-spreading boughs, and reminding one of the peaceful seat alluded to in Scripture. But this tree is likewise an object of great curiosity; for rising apparently out of its trunk 'another tree shoots up, tall, straight, vigorous, and leafy, although the lower part of its stem is enclosed within the body of the fig-tree, which is not in the slightest way disfigured by this strange adherent, although the colours of the bark and leaves, with their shape and texture, are quite different. I am now inclined to think that the apparent parasite in the centre has been a young tree encased whilst growing up by the fig twining round it; as I have more lately seen other and far loftier trees, round which many climbing stems had wreathed themselves in tortuous meshes, tracing in their turnings and windings the most elaborate network-like patterns on a truly gigantic scale; and no doubt had they done this before the trunk from which they derived support had attained its full growth, in time they must have formed a wooden case for it by uniting all together, as those of the fig-tree have evidently done.'

This beautiful vegetation, however, has sometimes visitors more curious than agreeable. 'Whilst sitting on a sofa in my room busily writing, I suddenly perceived first one black ant, and then a second and third, scampering over my papers, and looking round, saw a portion of the wall covered with straggling ants, while another moment showed me that the floor was alive with them. Boiling water was immediately put in requisition, and for upwards of an hour, poured over the outer boarding of the house, where the ants swarmed pretty thickly. A huge centipede was attempting to crawl from under one of the planks, but quite unable to extricate himself from a few ants, who, at regular distances from each other, held their colossal prey undauntedly, while large spiders were running about in terror, trying to hide themselves. The track of the main army was nowhere to be discovered; and as our vigorous opposition had caused them to retreat from the room, I thought this had been merely a reconnoitring party, until an outcry was raised that they mustered in great force in the piazzas below. I ran down stairs, and beheld the floor, pillars, walls, and boarded roof literally black with myriads of ants; while here a great scorpion, startled out of his den, stood boldly at bay; and there another centipede was being dragged away alive, after having in vain tried to elude pursuit. But it was not one or two—several dozens of cockroaches, venomous-looking spiders, millipedes, and innumerable other ugly forty-footed creatures, were first pounced upon by a few of their Lilliputian enemies, and then in an instant hidden by the accumulating masses, which fastened upon each opponent, and bore it off the field with the utmost regularity. I forbade the people to kill any more of the ants, so long as they were kept from entering the house—really feeling compunction in waging war against the destroyers of such detestable reptiles as scorpions and centipedes, with their many almost equally unwelcome cousins of other tribes.'

Another incident of African life occurred in the middle of the night. Our authoress, feeling cold, had got up for an additional coverlet, and had just taken her baby from the bed, and had wrapped him warmly in it, when she was startled by a loud noise, and in an instant a mass of falling bricks rattled about her ears, and completely demolished the bed. 'There was the rolling of thunder, and the yet more awful sound of a mighty wind; and in that moment of terror a thousand thoughts rushed into my mind—of hurricanes, earthquakes, and lightning-struck houses. I could not tell what had happened; but, although free from bodily hurt, believed that the whole house was tumbling down, and that the hour of death was come to us all. I could raise neither the infant nor myself, being literally jammed amidst broken fragments of masonry and plas-

ter. Although it takes long to describe, this all occurred in the shortest space of time—the heavy gust of wind not lasting three minutes; while in one instant M—— had torn the curtain through, and then, almost choked by the lime and mortar which showered upon me, I was enabled, by the flickering light of the lamp, to see baby, whom I drew out as I best could, and held firmly, M—— extricating me at the same time, and then hurrying us from the room.'

But we must come to the black denizens of this strange place. The cries of Freetown, the capital of the colony, appear to be as numerous as the cries of London. They begin shortly after daybreak, when women and girls are seen flooding in to market with round baskets on their heads called 'blies,' containing fruit and vegetables. 'Some have bowls heaped over with arrowroot; a greater number are laden with large round balls of dingy white called "foo-foo," a common food of the natives prepared from cassada, somewhat in the same manner as flour is from potatoes, and which they cook with palm-oil. Here are boys bearing wooden trays covered over with little brown cakes, and crying out, "Who'll buy hot ginger-cake?"—there girls shouting as loudly, "Agahdee! who'll buy sweet agahdee?" (a sweetened mass of boiled rice or Indian corn, rolled up in a broad green leaf). Numerous other and still more unintelligible names are shouted out by different people; while men saunter along under the burthen of stone-bottles, similar to those which hold Seltzer-water or ginger-beer, calling, with much the same perverted pronunciation as the London old-clothes-men, "Pamh-wenh!" meant for palm-wine. I have seen one girl, apparently a sort of travelling pedlar, her smart blue gown, yellow shawl, and crimson handkerchief rivaling the plumage of a parrot, while about a dozen strings of as variously-coloured glass beads were fastened round her neck. From several of these hung small looking-glasses in red-painted or yellow-lacquered frames; to the rest were attached papers of mother-of-pearl buttons; and her basket displayed a tempting assortment of pins, needles, reels of cotton, pieces of tape, and brass thimbles. One hand supported her bly of precious wares, the other held skeins of thread, and more gay necklaces, which she kept dangling backwards and forwards with an air of the utmost satisfaction and triumph.'

The most simple dress is a 'country cloth,' thrown over one shoulder, and under the other. The women have gowns of a blue thin print; but the better class wear pink or lilac dresses of fine calico, and silk shawls. On Sundays girls are to be seen in white frocks of chequered muslin, and pale-blue beaver hats. They have almost all silk umbrellas, to keep the sun from their black complexions, but none wear shoes. The Mandingoes, or Mohammedan negroes, have 'a wide flowing mantle, gathered into a point above the waist in front, and with loose hanging sleeves; very ample trousers drawn full round the ankle; a high peaked cap of blue cloth embroidered in gaudy colours, or else of plain scarlet or white stuff.' They wear amulets and rosaries. 'The settlers in the colony, and also the slaves that have been emancipated here, who are termed "liberated Africans," assimilate their dress to that of Europeans; the wealthier sort wearing jackets, waistcoats, and trousers of cloth, white duck, or blue baft (a thin flimsy cotton stuff, much in request amongst the blacks), with broad-brimmed straw-hats tied round with black or coloured ribbon, or round smart cloth caps; while the ordinary apparel of domestic servants consists of a white jacket, check shirt, and duck trousers.'

The faces of some of the blacks are hideously deformed by gashes and tattoo-marks; but our authoress discovers a surprising physiognomical difference between those born in slavery and those born free. 'Whilst many of the liberated Africans, other than those emancipated after being grown up, present countenances rendered repulsive not only by their natural unsightli-

ness, but by the expression—whether it be that of utter vacancy of ideas, or of the predominance of bad passions, added to forms cast in the very coarsest mould—the free-born children of perhaps those very people have better features, with fine intelligent eyes, and figures often well-proportioned and delicately made. Indeed some of the little mountain-maidens I meet bringing down their blies of vegetables to market have quite a prepossessing aspect; and I have seen several amongst the school-children too, both boys and girls, with that frank, ingenuous, animated look, and upright graceful carriage, it is impossible could belong to any one who did not *know* he was free.

The history of the settlers, as contradistinguished from the liberated Africans, is very melancholy. In 1787 several hundreds of the destitute blacks in London were sent to Sierra Leone; but they all died off before the main body of settlers arrived five years afterwards from Nova Scotia. These were the negroes who had remained faithful to England during the American war, and they had petitioned to be sent as colonists to the land of their ancestors. They were accordingly transplanted to the number of 1196; but many died on the passage, and the ranks of the survivors were greatly thinned by wild beasts, hunger, and sickness. During the first wet season 800 of the black colonists were laid up at the same time with the climate fever, while the white servants of the Sierra Leone Company were almost swept away. Then came the French, who burned down the infant town; and in 1800 the Nova Scotians, exasperated by their continued calamities, and finding a pretext in a small quit-rent levied on their farms, rose in insurrection. After this disturbance was quelled, the colony was several times invaded by a neighbouring tribe; but in 1807 it was transferred by the Company to the British government; and since then, among the black people, there have been only the usual grumblings about bad times and inadequate wages.

The settlers look upon themselves as the gentry of the blacks, being able to trace a kind of *Norman* ancestry of some forty or fifty years' antiquity. The children of the recaptured slaves, in like manner, forget as soon as possible the parentage from which they sprang, and look with contempt upon the newly-liberated Africans that are drafted from time to time into the colony. Some of the blacks make large fortunes, competing even with the European merchants; but all of them contrive to sell something or other in the market of Freetown. Some cut down a tree, and saw it into boards for sale; others shear the grass on the hill-sides for provender; others, again, deal in underwood, Guinea-grass, and Canada plantains, bananas, pawpaws, yams, &c. which they cultivate with the sole aid of a rude hoe. Soap, tobacco, household furniture, baskets, mats, and numerous other native manufactures, attest their industry.

We must now talk of the *literature* of the negroes, and with that we shall conclude. Many of them learn to read and write, and of the latter they are especially fond. A servant applying for a place sends an eloquent letter with his character; and one morning our authoress received the following epistle:—

'Please, madam, I very sorry no mutton live in market this morning.—Your affectionate butcher,

JOHN MACAULAY.'

The following three specimens are very good:—

'M———, Esqre.

Have me excuse for the other name.

FREETOWN, *Sierra Leone*.

'HONOURED SIR—With deep humiliation and earnest desire I come to solicit you a certain thing, and that of your kindness it will grant to your humble servants. Sir, will you be good enough as to employ me in the business as a messenger in your office, sir, and only try me, and you will not see me in advertent?—I must subscribe my name under this paper.

(Sygued) DANIEL DAVIS.'

'SIR—Your humble petitioner brings his petition

to you, showing that he is about passing within your premises to his farm, and would be obliged should you be good enough by allowing him to shot any birds or monkey, for to be eaten, previous to his going along.—And your petitioner, as in duty bound, I ever pray to be your obedient servant,

J. S. D. DAVIES.'

'DEAR SIR—I have hard that you are in want of a Horse man, and I can retake furthering myself; should my services be required as a Horse man, you will find a good horse man and a man of knowledge of about horse.—I am your very truly servant,

MOSES JOHNSON.'

The following mystic paragraph, occurring in a begging-letter, we commend to the cogitations of our readers:—'There is a way of which one cannot complain in common terms. It would draw imprecations from a man that never used a stronger affirmative in all his life than "yea verily," and raise the indignation even of the mildest father of the Oratory.'

GUILLAUME DUPUYTREN.

FROM THE FRENCH.

ONE of those water-carriers who attend the houses of the poorest and most populous quarters of Paris was going along the streets one morning in November 1794. He was a young man, whose ruddy complexion and firm open countenance indicated both health and good-humour. He sometimes laid down his buckets, that he might rub his benumbed fingers, for the weather was intensely cold; and as often as he did so, he took the opportunity of crying out in a voice that did credit to his lungs, 'A l'eau! à l'eau!'

On reaching an old-looking house in the Rue Haute-feuille, he entered the court, and called out to the woman at the lodge, 'Do you want water, mistress?' On receiving an answer in the affirmative, he took in his buckets, and had just emptied them into the fountain, when the postman entering, threw down a letter on the table, saying, 'Post-paid,' and continued his way.

'If you are going up stairs now, Chassagne, perhaps you would take up this letter? It is for the young student in the next room to yours.'

'Is he above now?' said Chassagne, taking the letter.

'He has not been down stairs these three days,' said the portress; 'and I have reason to fear that he has not had a morsel to eat either yesterday or to-day. If he were not so proud, I would have carried him up a little bread and milk; but I am afraid of offending him.'

'We must take him something, Madame Gibard; we must indeed,' said the waterman, quite affected by what he had heard.

'Yes, to have him say as he did last week, "Who desired you to bring that to me, madame? I am very much obliged to you, but I do not require it;" and as he said that, Monsieur Chassagne, the tears came into his fine blue eyes.'

'Well,' said the waterman, holding up the letter, 'I think there is something here that will comfort him: post-paid letters always contain money, I know that;' then whistling a little merry air, he proceeded up the stairs till he reached the student's room at the top of the house, when, rapping at his door, a low and melancholy voice desired him to come in. On entering, Chassagne beheld with compassion the scene that presented itself to his view: it was one of complete misery and desolation. On a low truckle-bed, barely covered with a thin mattress, a pale delicate-looking youth sat writing; and from the number of well-filled sheets which lay scattered on his wretched coverlet, it was evident he had been writing for some time. His books were on a small table at his bedside, and on an old straw-chair (the only one in the room) his clothes were carefully folded.

'What do you want?' inquired the youth, over whose fine countenance a faint blush was diffused.

'The portress begged me to bring you this letter,' replied the waterman, as he handed it over to the young student.

'From Pierre Buffière!' exclaimed the latter, eagerly breaking the seal; but no sooner had he glanced over the contents than he turned pale, his eyes closed, and he sunk back on his pillow. For a few minutes he appeared to be struggling with some severe mental suffering; but quickly recovering himself, he raised his head, indignation flashed in his fine expressive eyes, and crumpling up the letter with his thin white fingers, he exclaimed, 'How cruel! how shameful!' He then remained as if stupified, and unconscious that he was not alone.

Chassagne, who had lingered in the hope of witnessing his neighbour's joy, when he saw the different effect the letter had produced, was afraid of being considered an intruder, and was about to retire, when a square piece of paper lying on the ground caught his eye. Guessing what it was, and thinking it had fallen from the letter unperceived, he picked it up, and presented it to the student, who merely thanked him, without looking at either him or the paper.

This was not what the waterman was aiming at; his compassionate feelings were strongly excited, and though he could not comprehend the nature of the youth's distress, he saw that he suffered much. On looking attentively about the room, he could not perceive the slightest vestige of food. The words of the portress rang in his ears—'*I fear that he has not had a morsel to eat either yesterday or to-day!*' There were, then, greater evils to be endured than working for small wages, or walking the streets of Paris exposed to the severity of the winter frost or the burning heat of the summer sun.

A long pause ensued, during which Chassagne was considering the best means of renewing the conversation. At length he said abruptly, 'It is not right of you, neighbour, to keep so much to yourself, just because you are better dressed and richer than I am.'

'Richer!' exclaimed the student; 'richer! I am dying of hunger!'

'That is but too evident,' said Chassagne; 'and if you will allow me, I will just come in a neighbourly way and breakfast with you.' And while the student stared in ignorance of his meaning, Chassagne cleared the table; and spreading on it a sheet of clean white paper, he laid on it a small loaf of bread and two sous' worth of cheese, which he had purchased for his own breakfast. 'Now,' said he, 'I must go and bring in something to moisten it;' and when, in about ten minutes, he returned with a bottle of wine and two glasses, he found his companion in the same state of stupor and dumb despair. Without making any remark, Chassagne quietly divided the bread and cheese in equal shares, and placing one-half before the student, he helped himself to the other; then filling out two glasses of wine, he said, 'Your good health, neighbour.' But suddenly the good-humoured countenance of Chassagne became clouded; he put down his glass, and said with some emotion, 'You will not drink with me, because I am a poor waterman, and you are a gentleman!'

This reproach seemed to recall the student to himself. 'Forgive,' said he, 'forgive me;' and seizing the glass, he was about to raise it to his lips, when a flood of tears compelled him to place it back upon the table. 'Oh,' said he, 'you can have no idea of what I am suffering! And you, a perfect stranger to me, to be so kind, while a near relation of my own—one who is wealthy, and has known me from my birth, would leave me to perish with hunger! I wrote to him a full account of my situation, and told him that, in consequence of the breaking up of all the public establishments, I had been obliged to leave the college of La Marche, but that I continued to pursue my studies with equal assiduity. I told him that I had no means, that I was without money, without clothes; I begged of him to advance me a few louis to pay for my lodg-

ings, to buy books, to buy even food: well,' continued the unhappy youth, taking the letter and paper (which was a post-office order), 'he sends me one louis, and for this miserable louis he thinks he has purchased the right of remonstrating, advising, and reproaching me. He reproaches me with having left the country to come and starve in Paris, and be a burthen to my family.'

'You ought to return that louis to your hard-hearted relative,' said Chassagne, wiping away a tear with the cuff of his coat.

The student warmly pressed the hand of his companion. 'You are right,' said he; 'you have a heart, and that is a comfort and relief to mine. I will share your breakfast, my friend, and after that, I will send back to the relation on whom I had depended both his money and his letter, even though I should die of hunger.'

'Oh, as to that, Monsieur Guillaume, as long as Chassagne can carry a pair of buckets, he will never allow a neighbour to die of hunger. I, who was left a poor destitute orphan, have never been allowed to want—and should I suffer a fellow-creature to die of hunger beside me? No, no; we must help one another: it is my turn to help you to-day, it may be yours to help me or some one else to-morrow.'

'Noble, generous sentiments!' exclaimed the student, who had risen, and was dressing himself while Chassagne was speaking, and had with difficulty swallowed a few morsels of bread, and taken a few sips of wine. 'Chassagne,' he continued, 'I accept your kindness, for I shall not always be a poor, sorrowful, medical student: I have abilities; and if I live, I will endeavour to acquire a name and a reputation, and then I will repay you a hundredfold for all your kindness to me. Oh, I am ambitious, Chassagne; and I hope one day to be head surgeon of the hospital.'

'I am ambitious too, Monsieur Guillaume, but my ambition is not like yours: my ambition is to have a water-cask instead of two buckets—a new water-cask of my own, painted red, with blue hoops. Oh what a happy day that will be when I can draw my own water-cask!'

In spite of his grief, the young student could not help smiling at the ambition of the waterman. 'Would a water-cask be very expensive?' Guillaume inquired, as he sealed up the letter and order.

'Why, monsieur, a new one, with cart and buckets, would cost at least two hundred and sixty francs; but,' he added in a confidential tone, 'I have two hundred put by for it. And now,' said he, 'what are you going to do? You had better leave me in care of your room, and go and put your letter in the post-office: a walk will refresh you, and I will arrange everything here: my customers are served, and I have nothing else to do at present.'

The two friends again warmly pressed each other's hand; and the student having departed with his letter, Chassagne sat down to finish his breakfast.

Five minutes had scarcely elapsed, when the waterman, hearing a step at the door, exclaimed, 'What! back already?' when, turning about, expecting to see Guillaume, to his surprise he beheld Monsieur Bouvard, the proprietor of the house.

'Where is Guillaume Dupuytren the student?' he inquired.

'He is gone out, Monsieur Bouvard; but I will deliver any message to him,' said the waterman civilly.

'Very well; then begin by coming out yourself,' replied the proprietor.

Chassagne obeyed, expecting to be sent on some errand after his companion; when, to his amazement, Monsieur Bouvard locked the door, and put the key in his pocket.

'What are you doing?' exclaimed Chassagne. 'You shall see,' replied the landlord coldly. 'I take possession of the key, in order to prevent the late tenant from entering the room again.'

'And where is he to go?' inquired Chassagne in a tone of pity.

'Wherever he pleases; that is no concern of mine: he owes me five months' rent; that is enough.'

'Oh, Monsieur Bouvard, do not do such a thing as that!' said poor Chassagne, clasping his hands in the most supplicating manner. 'Monsieur Dupuytren is honest: he will pay you.'

'When?' inquired the proprietor, endeavouring to get between the wall and the waterman, who was stopping the passage.

'As soon as he is able,' replied the latter. 'But you, sir, who are rich, do not, for a paltry sum, bring such ruin on a poor young man. Oh what can I do to excite your compassion?'

'Pay me,' said the landlord roughly.

'And you are depriving him of his books and his papers, as if he had not trouble enough without that. Monsieur Bouvard, give me that key,' said Chassagne; 'give me back that key!'

'What!—you menace me, do you?' said the proprietor, turning pale with anger. 'Take care that I do not turn you out along with him. Come, let me pass directly.'

'Oh, Monsieur Bouvard,' said Chassagne, whose quick ear had recognised the voice of the student speaking to the porter below, 'he is here already! Oh, Monsieur Bouvard, give me the key! I beseech you to give it to me; and,' added he, lowering his voice, 'if he does not pay you, I will.'

'With what money?' inquired the landlord in a tone of contempt, which made the colour rise to the forehead of the young waterman.

'With the money of an honest Auvergnat, which he has earned by the sweat of his brow.'

'These are mere words,' said the landlord, again endeavouring to pass.

'Put back the key, and come into my room,' said the kind-hearted waterman, opening a door beside him.

The landlord did so. Guillaume, who had now nearly reached the top of the stairs, turned pale at seeing Monsieur Bouvard, and was on the point of speaking to him, and requesting a little more time; but Chassagne prevented him by almost pushing the landlord into his room, when he immediately followed him, and closed the door.

Guillaume entered his own garret; the partition which divided it from that of Chassagne was not so thick but that he could distinctly hear the sound of money counted out upon a table. 'He is paying his rent,' thought he; 'and now Monsieur Bouvard will be coming in to me. What shall I say to him?—what can I say? Or rather what will he say to me when I again ask him for a little more time? Oh what a humiliating position to be in! My God!' said he, throwing himself upon his knees, while the tears rolled down his cheeks, 'grant me strength to bear this accumulation of sorrows!'

Presently the door opened, and Chassagne entered alone.

'Where is Monsieur Bouvard?'

'He is gone,' said Chassagne laughing.

'What! without asking me for my rent?'

'Oh, I have settled that: he will wait.'

'And what did you say to satisfy him?'

'Why, I said—I said—that you would pay him when you were head surgeon of the hospital.'

The student at first thought that his neighbour was inclined to ridicule him; but the countenance of the waterman remained so calm and so simple, and his manner so kind, that, banishing the thought, Guillaume took up his books, saying with a smile, 'Well, I must begin to work my way to it.'

'And I,' said Chassagne, leaving the room, 'must go and earn my water-cask.'

Guillaume wished to set about his studies; but after all the agitation of the morning, he found it impossible to collect his ideas. His heart was torn by conflicting

emotions: now bursting at the thought of his rich, but cruel relative, who refused to assist him; then thrilling with gratitude to his humble neighbour, who had so kindly come to visit and to share his breakfast with him. 'Oh,' said he, 'if I must be indebted to any one, let me at least endeavour that it may be to some one who is wealthy and able to assist me!' This ~~Mea~~ prompted him to undertake what was at once humbling to his pride and revolting to his delicacy. He arose, and making his appearance as neat as possible, he put on his college cap, and took his way to the Rue du Bac, in the Faubourg St Germain. He rang the bell at the gate of one of the finest houses in the street; and on being answered, he inquired if Monsieur le Comte Leon were at home.

'Are you invited, sir?' inquired the servant.

'No,' replied Guillaume.

'Oh, because this is Monsieur Leon's birthday, and he expects company.'

Guillaume was about to depart; but having endured the greatest pang attendant on the step he was about to take, that of ringing at the gate, he determined to go through with it. 'Tell your young master,' said he, 'that an old classfellow of the college of La Marche wishes to see him.'

The footman took the message, and on his return, showed Guillaume into the antechamber, where the duke's son soon appeared.

'Oh, is it you, Guillaume?' said he, holding out his hand to his old schoolfellow: 'what have you been doing since the breaking up of the colleges?' Then, without waiting a reply, and while Guillaume was hesitating as to the best means of mentioning the cause of his visit, the young count himself introduced the subject by saying abruptly, 'Do you know, Guillaume, that I am perpetually assailed by some of our old class-fellows, who think that, because I am rich, and the son of a duke, they have a right to draw on my purse, or rather on that of my father?'

'And surely you would not refuse them, Leon?' replied Guillaume in a voice expressive of the most painful emotion. 'You receive them kindly as old friends and schoolfellows?'

'You do me but justice in saying so,' said Leon; 'for certainly if an old schoolfellow were in distress, I would put my hand in my pocket and give him a three or a six-livre piece.'

'Oh, you would do more than that, Leon!' exclaimed Guillaume. 'If an old classfellow (like myself, for instance) were to come and say to you, "Leon, it is not charity I am about to ask, but I want some assistance to enable me to live until another school is established (which must be before long, for they cannot do without physicians and surgeons), could you lend me ten louis, and on the word of a man of honour, I will repay you?"'

Leon burst into an immoderate fit of laughter. 'Ten louis!' repeated he; 'ten louis! Why, that would be a month's pocket-money! How you talk!'

Guillaume took his handkerchief to wipe the cold perspiration from his forehead, and replied with all the energy of despair, 'It is true you would be a month without your amusements, but your friend could live and study for four.'

'You are a fool, Guillaume!' said Leon, shrugging his shoulders. 'But some one rings; we are expecting company to celebrate my birthday; will you come in, and I will introduce you to my father?' Guillaume, who had now nearly recovered his self-possession, coldly declined the invitation. 'Is it on account of your dress?' said Leon; 'you know I would not wish you to appear to disadvantage; and as we are about the same height, Lapiene can lend you something from my wardrobe.'

'No, I am obliged to you,' said Guillaume, so coldly, that Leon exclaimed, 'Oh, you are too proud! Very well, I must leave you, and you can see me another day when I have no company. Adieu! when shall I see you again?'

'Never!' said Guillaume. But suddenly recollecting himself, he added in a tone of bitterness, 'That is to say, Leon, we may meet again; but it shall be when you need assistance from me!'

'Then that will be never,' replied the wealthy youth, as he turned haughtily round to enter the saloon.

Guillaume Dupuytren retraced his steps homeward with a heavy heart; for the first time in his life he had stooped to ask a loan, and he had been refused it by a wealthy schoolfellow, who spent yearly twelve times the sum in trifling amusements, that would have enabled him to live and pursue his studies for four months. On entering his garret he found Chassagne there, who, as soon as he heard his step, called out, 'Come, loiterer, your soup will be cold.'

'Dinner!' exclaimed Guillaume, surprised and affected at seeing a bowl of hot soup smoking on the table.

'Do you not like it?' said the waterman with a good-natured smile, as he placed a small dish on the table beside the soup; 'and if I were in your place, would you not have done the same for me?'

'But,' said the young student, 'you must, I fear, be encroaching on your savings?'

'Pshaw!' replied Chassagne; 'you can pay me for it when you are made head surgeon of the hospital.'

'Then, Chassagne,' said Guillaume smiling, for the kindness and good-humour of the waterman cheered the heart of the poor student—'then, Chassagne, you shall have a water-cask with a good cart and horse.'

'Oh, a horse!' replied Chassagne. 'I do not aspire so high: to possess a water-cart is the utmost of my ambition.'

From that day forward the young waterman took upon himself the office of purveyor to the student: he was more; he became his friend, his brother, his servant. 'Now listen to me,' said he one day when Guillaume was refusing to accept such innumerable benefits: 'you know that my greatest ambition is to possess a water-cart. Well, I would give up the water-cart, if I had it, for a share of your friendship. I am the person obliged: until I knew you, I was a solitary orphan alone in the world. I had no one to speak to, no one to take any interest in me. I ate my meals alone; and when I returned home tired in the evenings, I went to my cold garret, where I had not a creature to take me by the hand as you do, and to say, "How goes it, Chassagne?" Oh, that does me good, Monsieur Guillaume! It warms me like a good fire.'

'But, then, your cask: you are making me eat your water-cask,' replied Guillaume, endeavouring to hide the tear which quivered in his eye at hearing the noble sentiments expressed by the poor waterman.

'Oh, we are both young,' said the latter; 'and God will not forsake us if we remain in the path of duty. I pray for you, Monsieur Guillaume, both night and morning.'

The tear, till then restrained, fell on the hand of Chassagne, which Guillaume pressed in silence. This state of things did not continue long. Towards the commencement of 1795 the establishment of the School of Medicine effected a change in the situation of the two friends: Guillaume entered the hospital as in-door pupil. The separation was severely felt; and Chassagne extracted a solemn promise from his friend, that should he at any time be in distress for money, he would apply to him, who loved him as a brother.

Some time after his installation, the principal physician, knowing the difficulties of his situation, and wishing to assist him, proposed that he should take care of a patient of his—a man of rank and wealth, who in the first place would pay him a louis per night for his attendance, and whose influence and patronage might afterwards be of service to him.

On hearing that the patient was the father of his heartless schoolfellow, Guillaume was at first disposed to refuse; but a moment's reflection made him gladly accept the offer. He repaired the same evening to the duke's residence, and proceeded immediately to the

invalid's chamber. By the blessing of God on his assiduous care and attention, before the end of the month the duke was pronounced to be convalescent; and on the same day he presented to his young care-taker twenty-five louis in gold.

Let us now return to Chassagne, who, since Guillaume had been unable to visit him in the evenings, had found the time unusually long. When the hour had passed which used to unite those two friends, that they might enjoy a little cheerful conversation after the labours of the day, poor Chassagne would go down and stand at the gate watching in the direction by which Guillaume would come, if he came at all. On the evening of the day we have mentioned Chassagne was at his usual post: the street was nearly deserted, no sounds were to be heard but the steps of a few stray passengers, when suddenly the rolling of a light water-cart, by breaking the stillness of the street, interrupted the musing of Chassagne. But do his eyes deceive him? Who is that young waterman who in dress and appearance so much resembles Guillaume? The cart rolls on; the figure becomes more distinct; the cart at length stops at the gate; and Guillaume, breathless and fatigued, could only call out from between the shafts, 'Chassagne, here is your water-cart!'

'Mine!' said Chassagne in astonishment.

'Yes, yours certainly: whose else should it be? But come and unharness me, for I cannot play the horse any longer.'

'Mine!' continued Chassagne, unable to believe his senses; 'this cart, this cask, these fine new buckets?'

Guillaume, who had succeeded in disengaging himself from the cart, took Chassagne by the hand, and leading him round to the back of it, showed him his name painted at full length. 'There,' said he, 'read that: No. 835, Chassagne! Whose name is that?—yours or mine?'

Joy, surprise, the realisation of his fondest hope, all combined to bewilder the happy waterman: he looked alternately at the cart and at Guillaume, then suddenly exclaimed, 'But where did you get it?'

'I bought it,' replied Guillaume.

'Are you, then, made head surgeon of the hospital?' said Chassagne, opening his eyes wide, as if the better to see the great person he believed stood before him.

'Not yet,' he replied laughing; 'but I have earned a little money, and your ambition was so very moderate, my good Chassagne, that I was anxious to gratify it. Come, put up your cart, and let us go to supper.'

It was on a fine morning in May 1816 that a splendid equipage drew up at a large house on the Place de Louvre. A gentleman descended, and inquired for the Baron Dupuytren. On being told he was at home, he desired the servant to announce the Duke Leon de X—.

'No person is announced here, sir: walk into the waiting-room, and the doctor will see you in time.'

When two patients had been dismissed, the duke was shown into the doctor's study.

'I fear I am too late, Monsieur le Baron; or rather I should say, my dear Guillaume. Do you not remember me?' said the duke.

'I remember you perfectly, Monsieur le Duc,' replied the baron coldly.

'My son, my only son, is dangerously ill,' said the duke; 'if any person can save him, it is you: pray come with me; my carriage is at the door, and any sum you name shall be yours.'

The baron took his hat, and inquiring if his cabriolet was in readiness, he followed the duke down stairs. On crossing the court to reach the street, a man entered it who seemed in the deepest affliction.

'Chassagne!' exclaimed the doctor, 'what is the matter?'

'Oh, Monsieur le Baron!'

'Call me Guillaume, or I will not listen to you.'

'My little girl, my youngest child, is dying, and I came to ask you to see her,' replied Chassagne.

'Come with me,' said the doctor.

'But my son, Monsieur le Baron; a moment's delay may be fatal to him.'

'I will visit your son, Monsieur le Duc, as soon as I have seen this man's child,' replied the baron, taking Chassagne into his cabriolet.

'Monsieur le Baron, I will give you six thousand francs on condition that you come with me instantly.'

'Otherwise you will not,' said the baron; and bowing to the duke, he desired the coachman to drive to the residence of Chassagne.

It was not until he was assured of the safety of the little girl that he repaired to the duke's residence: the heir of his title and fortune had breathed his last.

We have seen Guillaume Dupuytren in the year 1794 nearly perishing with hunger. Twenty-two years afterwards we find him at the highest pitch of eminence and prosperity, and that by dint of his own talents and industry. This celebrated surgeon was born at Pierre Buffière, in Limousin, in the year 1777. He came to Paris when twelve years old, and was placed in the college of La Marche under the care of the principal. The breaking up of all the public institutions having forced him to leave it, he was exposed to the sufferings we have described. In 1795 the School of Medicine was established, to which he was at first attached as *protecteur*: at a later period, in 1801, he continued there as principal of anatomy; in 1811 he succeeded Sabatier as professor; and in 1813 he was appointed second surgeon to the Hôtel Dieu at Paris, and soon afterwards a member of the Council of Health. In 1815 he was appointed head surgeon of the Hôtel Dieu, and in 1816 he was created Chevalier of the order of St Michael, and baron. His fortune and celebrity continued to increase until his death, which took place on the 8th February 1835. He left one daughter, Madame la Comtesse de B—, who inherits his large fortune.

The life of Dupuytren is one among many instances, that in order to arrive at eminence in any profession, it is not necessary to be born of wealthy or distinguished parents. Those of Dupuytren were respectable, his father having been, before the Revolution, a parliamentary lawyer; but having lost his place, he was reduced to great poverty. While Dupuytren lived, his talents, his life, his fortune, were all at the service of those who stood in need of them. He was the physician of the poor as well as of the rich; and their gratitude was more valued by him than the gold of the wealthy. He never forgot his early days; and was fond of affording that assistance and support to youth which he had himself received from a kind though humble friend.

SONGS AND POEMS ON COSTUME.

SINCE, ay and before, there was resort to mirrors, the toilet has been at once the most changeable and prominent feature of human life; on which account its whimsicalities—and their name is legion—have been largely noticed in the popular rhymes and songs of almost every age; a curious collection of which, ranging from the thirteenth to the nineteenth century, has just been given to the public by Frederick W. Fairholt, Esq. F.S.A.*

It is worth noting that nearly all the efforts of the muse on this subject have been of the satirical order; and the most conspicuous experiments in costume, though occasionally illustrated in old paintings and those guild coins of the middle ages called tokens, are made known to posterity chiefly by the denunciations of divines or the pasquils of contemporary poets. The earlier pieces of this kind give strange evidence of the dawn of literature in Europe; some being written in Latin, some in old French, and others in still less intelligible English.

The fourteenth century was pre-eminently an age of monstrosities in ladies' head-dresses. One variety of horns succeeded another on the heads of the court dames of

France and England throughout its entire course, with a diversity of shape and size which the genius of absurdity alone could invent. Now they were curved backwards, with the large linen handkerchief worn round the neck pinned up to them on either side, and space enough, according to a French author, for the largest weasel in his province to run between. Then they met in a crescent form over the forehead, and again rose almost straight from either side of the head. To all of them the satirists have left us ample memorials of their hostility, strengthened as it was by that of the clergy, who, after vainly exhausting their energies in preaching against the horns, at length hit upon the expedient of offering pardon in the old church fashion, at least for the sins of a few days, to those who would publicly jeer and annoy the wearers.

The satirical poets of those times occasionally turned their shafts against the costume of the clergy themselves; and not without reason, if one may judge from the forms of foppery with which they were charged about the close of the fifteenth century—such as wearing their hair so long in front, that it almost covered the eyes; sporting jewelled daggers; and delighting, in common with all the lords of the creation at that period, in long-pointed shoes, curving upwards, and fastened by chains to the knees; not to speak of wide puffed sleeves, and trains so long, that two pages were required to carry them. Whether the ladies borrowed the last-mentioned fashion from the church, or *vice versa*, cannot now be ascertained, as their trains have waxed and waned through many a generation to the very confines of our own. Trains were believed to have been introduced to the English by Richard II.'s Bohemian queen, who was also said to have made the ladies of England acquainted with the side saddle, and bequeathed them the riding-habit, still worn as a lasting monument of her love for ample drapery. Certain it is, that in the following age the longitude of feminine skirts was felt to be a nuisance of such magnitude in Scotland, that Sir David Lyndsay addressed a poetical petition against them and similar abuses to James V. In it the bard sets forth, in language more strong than elegant, the natural results of 'syde tailis'—that is, long skirts—and when the condition of the High Street for more than a century after is recollected, from that notable act touching the removal of 'middinges,' quoted in the 'Traditions of Edinburgh,' the consequences of a promenade thereon, with such appendages in full sweep, may, as the newspapers say, be imagined, but never described. Perhaps the most curious *fama* ever circulated against trains was contained in the following legend, which, as it was made current by a monk in the reign of Edward I., proves that those inconvenient appendages were at least known in England before the coming of the Bohemian princess. 'I have heard of a proud woman, who wore a white dress with a long tail; which, trailing behind her, raised a dust even as far as the altar and the crucifix. But as she left the church, and lifted up her train on account of the dirt, a certain holy man saw a devil laughing; and having adjured him to tell why he laughed, the devil said: "A companion of mine was just now sitting on the train of that woman, using it as if it were his chariot, but when she lifted her train up, my companion was shaken off into the dirt: that is why I was laughing."'

The satire of Lyndsay was enforced not long after by that of Sir Richard Maitland of Lethington, a poetical ancestor of the Earl of Lauderdale, whose papers have been preserved by Pepys. It might surprise some of our southern neighbours to learn in how fine a style the wives of Scottish burghesses dressed in the time of Queen Mary. Maitland says—'On claihts they wair [spend] mony a crown.' Their gowns are barred with velvet, sleeve, neck, and tails; the foreskirt of silk, with cambric ornaments.

* And of fine silk their furred cloaks,
With hinging sleeves, like jelly pocks. . . .

* Their wylie-coats maun weel be hewit—
Browderd richt braid, with passments sewit.
I trow wha wald the matter speir,
That their gudeman has cause to rue it,
That ever their wives wear sic gear.

* Satirical Songs and Poems on Costume. Printed for the Percy Society. 1849.

Their woven hose of silk are shawin,
Barrit aboon with tastels drawin
With gartens of a new mannér;
To gar their courtliness be knawin,
And all for newfangledness of gear.

Sometime they will bear up their gown,
To shaw their wylie-coat hinging down;
And sometime baith they will upbear,
To shaw their hose of black or brown,
And all for newfangledness of gear.

Their collars, carcats, and false beads,
With velvet hats heich on their heads,
Corded with gold like ane younkeir,
Browded about with golden threads,
And all for newfangledness of gear.' . . .

The 'muffler' was another piece of ladies' wear which aroused the honest indignation of many a bard, probably from its somewhat Oriental character, and evident adaptation to mystery and concealment. It consisted of a triangular piece of cloth, generally white, with two long ends which were fastened behind over the cap. Some say it was introduced into Scotland by the German and Flemish Jews, who took refuge there from ancient persecutions: others, that it came with the first hordes of gypsies. Whichever is true, it prevailed in Scotland for a long period. A sumptuary law of James II. forbade its being worn at kirk or market; and Sir David Lyndsay mentions with approbation the superior manners of the French ladies, who kept their faces uncovered in public, so as to receive and return civilities. Whereupon the poet suggests—

'Without their faults be soon amendit,
My flyting, sir, sall never be endit;
Bot wald your grace my counsel tak,
Ane proclamation ye suld mak,
Baith throw the land, and borrowstouns,
To shaw their face, and cut their gouns,
Nane suld fra that exemptit be,
Except the queenis majestie.'

As neither the mutability nor extravagance of fashion was confined entirely to the ladies, something like poetical justice was done by old satirists to the vanities of the stronger sex; and many a witty though rustic rhyme chronicles the fantastic guises worn by their different generations. The various forms of beards, cloaks, caps, and doublets, all are commemorated. Songs on such subjects multiply as we approach the seventeenth century, and the titles of some of them, like the tracts of that period, are their most curious parts: for example, one written during the reign of distended nether-garments is called 'A Lamentable Complaint of the Pore Countrymen against Great Hose, for the Losse of their Cattelles Tails.' The substance of this ditty is, that all manner of wool and hair, including the much-missed tails, were literally swallowed up by way of stuffing for the enormous hose; and there must have been some truth in the complaint, according to a contemporary writer, who states in sober prose—'They are almost capable of holding a bushel of wheat; and if they be of sackcloth, they would serve to carry malt to the mill.'

'What hurt and damage doth ensue
And fall upon the poor,
For want of wool and flax of late,
Which monstrous hose devour. . .

. . . not one beast nor horse can tell
Which way his tail is safe.

For now in country round about
No gelding, horse, nor mare,
Nor other beast of any price,
Put forth all night we dare.

Nothing so feared we are of thieves
Which oft are laid in jails,
As now we are of miching knaves
That cut off horses' tails,' &c.

Another costly portion of male attire, though the articles were common to the dress of both sexes, was sleeves, which in those times were detached from the garments. Their shape and size were frequent subjects of sumptuary laws; and expense both in the quality and quantity of material was thus regulated according to rank. At one period it was forbidden that mere burghers or their wives

should wear purfled sleeves. A pair of sleeves of cloth-of-gold is mentioned, among several others, in the wardrobe of Henry VIII.; and down to the reign of Louis XVI., 'gentleman of the sleeve' was the title of a court officer. The special consideration bestowed upon these articles is observable from an old pastoral, written about the days of Elizabeth, called 'My Lady Greensleeves.' The same appellation was, by the way, conferred on a sort of mythological person who accompanied 'Goldy-Locks,' and the Morris-dancers, with Maid Marian, and the May games of later times, to the great scandal and wrath of the Long Parliament.

Among the complicated contentions of the Stuart reigns, costume itself became a matter of party distinction, and was mixed up with sectarian controversy. Hence many songs of that period were devoted to the subject of dress. The Cavalier minstrel poured contempt on the close crop of the Puritan, and the Roundhead bard by turns denounced and ridiculed long hair.

One of these choice spirits boldly proclaimed it to be nothing less than the banner of Satan displayed in triumph from a man's head; while a poet of the opposite opinion asserted that cutting the hair short was a despicable casting away of a fair gift from Providence. Another class of poems regarding costume were called 'Moralisations,' in the symbol-loving fashion of those old times. They represented virtues and vices, opinions and even parties, by familiar and fashionable articles of dress. Though most frequently employed at the period referred to, this method was much more ancient. A French poet some ages before invested his *dame d'honneur* with every equipment to match, from the slippers of humility to the pincushion of patience; and a Scottish bard, in a song called 'The Garment of Gude Ladyes,' minutely describes an entire suit as worn in his own times, but made up of virtues and graces which would become a wearer of any age. The 'points' appear to have been often pressed into this kind of service. They were metal tags at the ends of ribbons used to fasten every description of dress, before either buttons or hooks were invented; on account of which general usefulness, their designation was given to theological doctrines and articles of belief, in ages when these were at once the standing topics of conversation and perpetual grounds of dispute. Sometimes, too, the simile was employed for simpler and more terrestrial purposes. 'A Dozen of Points sent by a Gentlewoman to her Lover as a New-Year's Gift,' was the somewhat lengthy title of a sentimental song; and good points they were, being all wise and worthy counsels, including the last—

'Love me as I love thee, and shall
From hence for evermore.'

One of the best-written party songs of the dress order represents Cromwell and his colleagues as a

'Cloak that fell out with a gown,
That cramp't all the kingdom and crippled the crown.'

But as those bones of contention grew old, the satirical muse turned once more to the doings of the ladies. One author entitles his song 'A Meditation on the Pride of Women;' and the still more complimentary refrain of another is, 'Women, monstrous women, what do you mean to do?' It is strange and edifying to read a poem of this description called 'The Lady's Dressing-Room Unlocked,' which its author presents as a warning to all adventurers on the sea of matrimony what they are expected to provide. What a number of long-disused and forgotten articles is there summed up as then forming the indispensable apparatus of fashion! Just by way of samples—'plumpers for hollow cheeks, and chicken-skin gloves to whiten the hands in sleep.' How oddly, too, some of their toilet appellations would sound! For instance, 'heart-breakers' and 'murderers'—these gentle titles implying merely knots and curls. Suffice it to say, that the patches, the blue hair-powder, and the night-rail all were sung as they appeared. The latter article was worn in Ireland by elderly ladies of the last generation over their gowns, though singularly disliked by the lower orders, especially those of Dublin, who fairly put it

out of fashion by inducing an unfortunate criminal to wear it on the day of execution.

Any reader must observe that the satirical songs concerning costume, though furnished with ample materials, degenerate wonderfully, both in wit and composition, as we descend to modern times. Those on the gigantic head-dresses which grew up in the latter years of the eighteenth century are very inferior, but their deficiency was in some degree supplied by the caricatures of that period, which represented even its historical scenes as taking place on the heads of ladies.

The 'hoops,' which became general many years before, called forth sundry effusions, the liveliest of which was the popular chant, 'Oh, mother, a hoop!' And a French chanson, written under the Orleans regency, records a similar, though ephemeral fashion, by which the gentlemen's skirts were kept stiff and square by means of strong whalebone. Several keener satires followed the appearance of its contemporary the 'Pantin,' or 'Tumbling-Jack,' a toy whose motions still awaken the delight and wonder of many a juvenile mind; but in that frivolous and profligate court it was publicly carried about as an appendage to a walking gentleman, as necessary to complete his *tout ensemble* as the sword and hat, the latter being invariably carried under his arm. Only think of physicians, magistrates, and divines displaying their varied graces or gravity with such an accompaniment in the streets of London! Yet such was the case in those of Paris about 1748, and the fashion was partially established in England.

Being anxious to present one specimen of the dress verses of this epoch, we select, after some hesitation, an 'Advice to a Painter,' of date 1755:—

'Best of painters, show thy art,
Draw the charmer of my heart,
Draw her as she shines away
At the rout and at the play;
Carefully each mode express;
Woman's better part is dress.
Let her cap be mighty small,
Bigger just than none at all;
Pretty, like her sense, and little;
Like her beauty, frail and brittle.
Be her shining locks confined
In a threefold braid behind;
Let an artificial flower
Set the frisure off before;
Here and there, weave ribbon pat in,
Ribbon of the finest satin.
Circling round her ivory neck,
Frizzle out the smart Vandeyck;
Like the ruff that heretofore
Good Queen Bess's maidens wore;
Happy maidens, as we read,
Maids of honour, maids indeed!
Let her breast look rich and bold,
With a stomacher of gold;
Let it keep her bosom warm,
Amplly stretched from arm to arm;
Whimsically traversed o'er,
Here a knot, and there a flower,
Like her little heart that dances,
Full of maggots, full of fancies.
Flowing loosely down her back,
Draw with art the graceful sack:
Ornament it well with gimping,
Flounces, furbelows, and crimping;
Let of ruffles many a row,
Guard her elbows, white as snow;
Knots below, and knots above,
Emblems of the ties of love.
Let her hoop, extended wide,
Show what petticoats should hide;
Garters of the softest silk,
Stockings whiter than the milk;
Charming part of female dress,
Did it show us more, or less.
Let a pair of velvet shoes
Gently press her pretty toes,
Gently press, and softly squeeze;
Tottering like the fair Chinese,
Mounted high and buckled low,
Tottering every step they go.
Take these hints, and do thy duty,
Fashions are the tests of beauty;
Features vary and perplex,
Mode's the woman, and the sex.'

The best British songs which refer to costume are

those of the Jacobites celebrating the tartan hose or the white cockade, both alike obnoxious to the powers that were, with the exception of some Irish lyrics, also of a political character, the finest though least known of which is Curran's 'Wearing of the green,' that colour being symbolical in the eyes of the government, as well as those of the Opposition, of concern in the rebellion of 1798.

It is remarkable that in all the songs of the present age there is scarcely a reference to prevailing modes of costume. Fashion still makes our people 'apes of her distortions,' though not to the extent of former times; for as civilisation spreads among the masses of every rank, a preference for the convenient and becoming gradually gains ground. Yet there have been, and are, occasional extravagances. Posterity will be edified concerning the 'bustle' and the 'Albert Hat,' by the plates and articles of our jesting periodicals, when changes yet undreamt of have passed over both society and literature, and the sheets over which we have laughed are laid up by scanty remnants in library and museum, as riddles for the curious inquirer, and evidences how flowed the current of our times.

ENGLISH NEWSPAPERS AND FOREIGN NEWS.

THE success of English newspaper proprietors in attaining pre-eminence over continental rivals, has been greatly assisted by the extent and perfection of our mail-packet arrangements. We have now nearly 150 steamers, most of them of the greatest power and speed, engaged specially in bringing political and commercial intelligence from all parts of the world. They are never delayed at any port at which they may touch but for the purpose of coaling and landing and embarking mails, and their rapid and punctual arrival in this country, after in some instances running a distance of 3000 miles without stopping, is one of the wonders of this remarkable age.

The expense of editing, sub-editing, and printing English newspapers, enormous as it is, is insignificant when compared with the vast sums expended in collecting foreign news. To obtain that news, correspondents are occupied in all the chief cities and seaports of the world. These persons are men of the highest intelligence; and they are expected to penetrate the secrets of courts and cabinets, to attend the marts of business and exchange, and submit to the inconveniences and even dangers of the camp, for the purpose of gleanings information of what is transpiring abroad. Agents are kept at every English port for the purpose of collecting this information as soon as it arrives. Couriers are oftentimes travelling from the most distant parts with newspaper information, steamers are solely employed in conveying such couriers across the English Channel, and special railway trains are hired to convey a few items of foreign news, and the electric telegraph is subsidized for the same purpose. In fact no outlay or effort is spared by the British journalist to outstrip in speed every means that can even partially acquaint the public and the government with foreign intelligence.

The newspaper agents at the outposts must be well acquainted with the necessities, as far as information is concerned, of British commerce, and its peculiar ramifications and connections in different parts of the world; they must also have a knowledge of the politics of different countries, and of the latest foreign news which has been published in the English journals. The foreign news collected at Southampton is principally from the cities and seaports of the Peninsula, from the British, Spanish, Dutch, French, and Danish West India Islands, the Gulf of Mexico, the United States, and the Spanish main; occasionally also important news reaches Southampton from Havre and the Cape of Good Hope.

It is a well-known fact, that oftentimes before a foreign mail packet comes alongside the Southampton Dock wall, hundreds of persons in London eighty miles distant are reading from the public journals with breathless interest the news she has brought; that while the packet is coming up Itchen Creek, the intelligence of which she is the bearer has been transmitted to the metropolis, and printed and published; that during that short interval of time her news has affected the public funds, and induced numbers to risk the acquisition and loss of whole fortunes by speculations in trade and in the public securities.

When a mail packet is due at Southampton, watchmen

are employed day and night by newspaper proprietors to look out for her. In the daytime, when the weather is clear, and there is not much wind stirring, the smoke of a large mail packet in the Solent may be seen by looking from the quay over Cadlands; but homeward-bound steamers are generally made out by means of powerful telescopes after they have passed Eaglehurst Castle, by looking over the flat tongue of land which terminates where Calshot Castle stands. When she rounds Calshot Castle a rocket is thrown up from her, which is a mail-packet signal. As soon as the rocket is observed, the watchmen are in motion, running in different directions up the town. In a few minutes may be seen stealthily gliding towards the quay a few persons, who, if it be a winter night, would scarcely be recognisable, disguised as they appear to be in greatcoats, comforters, and every kind of waterproof covering for the head, feet, and body. These persons are the outport newspaper agents. They make for the head of the quay, and each jumps into a small yacht, which instantly darts from the shore.

Cold, dark, and cheerless as it may be, the excitement on board the yachts is very great in calculating which will reach the steamer first; and at no regatta is there more nautical science displayed, or more keen and earnest contention. Let us suppose the time to be about six o'clock of a dark winter morning, the yachts reach the steamer just as 'ease her' has been hoarsely bawled by the pilot off Netley Abbey. As soon as *pratique* has been granted, the newspaper agents climb up the side of the steamer, oftentimes by a single rope, and at the risk of their lives, and jump on board. A bundle of foreign journals is handed to each of them, and they immediately return to their yachts, and make for the shore. The excitement and contention now to reach the shore is far more intense than was the case during the attempt to reach the ship. While making for the shore, sometimes in the most tempestuous weather, perhaps the rain peppering down, and the wind blowing great guns, or thunder and lightning overhead, the foreign journals are hastily examined by means of a lantern similar to that used by policemen, the most important items of foreign news which they contain are immediately detected, and the form in which they must be transmitted to London arranged in the mind. The agents are landed as near as possible to the electric telegraph office, sometimes on the shoulders of their boatmen through the surf or mud. They arrive at the telegraph office, and to write down their messages is the work of a few minutes only.

The rule in writing down telegraph messages is simple—to convey the greatest quantity of news in the fewest possible words. Perhaps the message is as follows:—'*Great Western*, Jamaica, 2. Cruz, 26. Million dollars. Dividends fifty thousand. Mosquito war ended. Antilles healthy. Havana hurricane. Hundred ships lost. Crops good. Jamaica, rains. Sea covered, wreck, plantations.' While the agents are writing these messages, the telegraph is at work, and by the time the messages are written in Southampton, they have been almost communicated to Lothbury. A cab conveys written copies of them, with the utmost despatch, to the newspaper offices. They are immediately in the hands of the foreign editors or sub-editors, who comprehend the purport of them immediately. In a few minutes they have been elaborated and made intelligible, and they shortly appear in a conspicuous part of the morning papers in the following shape:—

'ARRIVAL OF THE WEST INDIA AND MEXICAN MAIL—IMPORTANT NEWS FROM THE WEST INDIES—DREADFUL HURRICANE AT HAVANA—AWFUL DESTRUCTION OF PROPERTY IN JAMAICA.

'The Royal Mail Steam-Packet Company's steamer *Great Western* has arrived at Southampton. She brings news from Jamaica up to the 2d inst., and from Vera Cruz up to the 26th ult.; she has on board on freight to the amount of 1,000,000 dollars on merchants' account, and 50,000 dollars on account of Mexican dividends. The miserable "little war" unfortunately entered into by this country on behalf of the black king of Mosquito has terminated. We regret to learn that a most destructive hurricane has happened at Havana, and that a hundred ships have been wrecked in consequence. The weather, we are happy to say, has been fine in the West Indies, and the islands are healthy. The crops of West India produce are progressing favourably. The May rains at Jamaica have been very heavy, and done considerable damage. The rivers have swollen enormously, overflowed their banks, and done great damage to the plantations. The sea, at the

mouths of the rivers, was covered with the wrecks of the plantations.' In an incredibly short space of time thousands of newspapers, containing this news, have been printed and conveyed to the railway stations.

It is now seven o'clock in the morning, and trains are starting to all parts of England. In a short time the London papers have reached Liverpool, Bristol, Hull, Brighton, Dover, Folkestone, Southampton, east, west, north, and south. Hundreds have been dropped at intermediate stations. Before the foreign mail brought by the Southampton steamer has been sorted, perhaps the London papers have nearly reached every town in England, Wales, Scotland, and Ireland, and are travelling with a giant's pace over the continent.

But let us return to the London newspaper offices, where the steam-engines that print the papers never tire, but are unremittently throwing off hundreds per minute, and are now working at seven o'clock in the morning to supply the metropolis. In a short time the newspapers enter coffee-houses, taverns, counting-houses, public offices, and private dwellings, and thousands in London and distant parts of the country are reading simultaneously from the public journals the news which reached Southampton an hour or two since. The holders of Mexican stock smile as they read of the dividends; underwriters, and thousands who have seafaring relatives, feel a pang at the news of the hurricane; and tens of thousands feel an interest from curiosity, or a more powerful motive, in the details of the news, cargo, passengers, or letters the ship has brought.

It is a singular fact, that the inhabitants of Southampton generally first learn of the arrival of the mail packets in our docks from the morning papers. Persons come to Southampton to meet friends or relatives from abroad; they lodge near the water, to be certain of knowing when the packets arrive, and it often happens that the morning papers on the breakfast table give them the first intimation of the arrival of those they are anxious to meet. Two or three years ago the celebrated Paredes escaped from Mexico, and came to Southampton in a West India steamer. He arrived almost *incog.*, and was scarcely aware that he was known on board. Some slight delay took place before the steamer could get into the dock, owing to the tide, and Paredes had no idea that any communication had been made with the shore. To his utter astonishment, the first sound he heard on landing was his own name; for a newsboy was bawling to the passengers from a morning paper, 'Second edition of the ——. Important news from Mexico. Arrival of Paredes in Southampton.'

The great Mexican monarchist has since travelled all over Europe, and is now in his own country; and he has been heard to declare that the greatest wonder he knew in this quarter of the globe, was the rapidity with which news was obtained and circulated in England.—*Hampshire Advertiser*.

THE FREE WILL OF MAN.

Let any man dive into his own heart, and observe himself with attention. If he have the power to look, and the will to see, he will behold, with a sort of terror, the incessant war waged by the good and evil dispositions within him—reason and caprice, duty and passion; in short, to call them all by their comprehensive names—good and evil. We contemplate with anxiety the outward troubles and vicissitudes of human life; but what should we feel if we could behold the inward vicissitudes, the troubles of the human soul?—if we could see how many dangers, snares, enemies, combats, victories, and defeats, can be crowded into a day—an hour? I do not say this to discourage man, nor to humble or undervalue his free will. He is called upon to conquer in the battle of life, and the honour of the conquests belongs to his free will. But victory is impossible, and defeat certain, if he has not a just conception and profound feeling of his dangers, his weaknesses, and his need of assistance. To believe that the free will of man tends to good, and is of itself sufficient to accomplish good, betrays an immeasurable ignorance of his nature. It is the error of pride; an error which tends to destroy both moral and political order, which enfeebles the government of communities no less than the government of the inward man.—*Democracy in France*, by M. Guizot.

WHAT IS CRITICISM?

At a time when no inconsiderable portion of English literature consists of criticism, the question may perhaps be impertinent, as well as a little startling—*What is criticism?* It is a question, however, to which no answer can be found in any one of the publications that are devoted to criticism, or in all of them collectively. Day after day, week after week, month after month, quarter after quarter, the press flings forth upon the country a host of so-called critical works; but we will defy the most ingenious person living to collect from them the slightest notion of what criticism is. In some there are long, and occasionally elegant, or even profound, dissertations on a given subject, sparingly illustrated with extracts from a particular book. In others there is little or no original dissertation, but merely a garbled statement of the author's opinions, with quotations in evidence, selected without reference to the context or general scope of the work—mere bricks brought forward as specimens of the edifice. In others, the specimens are of the ornamental kind; for it is the main business of this class of critics to provide amusing or interesting reading for their subscribers, and fill up their sheet, not at their own, but at their author's expense. Here the original remarks are brief and inoffensive, and usually indicate that the critic has taken the trouble to put himself in possession of the subject by reading the preface to the book. In others, again, there is no room for either dissertation or extracts, but we are favoured, instead, with a character of the work, conveyed in a few lines, and in such distinct and peremptory terms, as leave us no pretext for doubt. Luckily, this sort of testimonial (in which the minor newspapers deal largely) is usually on the favourable side; partly, no doubt, from the good-nature of the editor, but principally from his intellectual aspirations after presentation copies and advertisements.

If you know the political party or religious sect of the critic, you may predict with little hesitation the fate of the author (when his sentiments are known) who comes before him. This would be natural enough if the theme of the work were politics or religion; but the rule holds good even when these dangerous subjects have been carefully avoided. The critic, supposing him to be of the adverse sect or party, looks upon the author as his enemy; and being under no obligation to show his whole scope and meaning, he takes him up on as narrow grounds as he pleases, and must be a bungler indeed in the trade if he cannot support his indictment even by the victim's own testimony. Personal likings and dislikings may be indulged in the same way; and it is the commonest thing in the world for an author, in consultation with his publisher, to say, 'I am sure of a favourable opinion in such a quarter, for the editor is a friend of mine.' Nor is he mistaken: the editor serves his friend, and loses no character either

moral or literary by the transaction. The desire of presentation copies is usually reckoned the lowest of a critic's motives; but there is a meaner influence still—that of mere senseless, abject imitation. Unless led by some temptation into a path of his own, he follows the crowd, joining in their praises or objurgations, but more especially in the latter: just as, to use a simile of the historian Joinville, 'when there is one dog pursued by another, and a shouting made after him, all the other dogs fall on him.'

That criticism as we have described it, taken generally, whether gentle or severe, whether laudatory or damnable, is in plain language a fraud, can hardly be denied; and it is a fraud which the more demands exposure, from the circumstance of the publishers lending themselves to it as accessories. There are no men who know better than they that it is a fraud; and the 'extracts from reviews,' therefore, which they append to their advertisements are, in nine cases out of ten, a deception practised upon the public. We have often been amused by the anxiety with which these gentlemen search out the notices of their works, the scorn they express for them when read, and the haste they make to turn them, when that is possible, to profitable account. As for the excellent Public, when disappointed in a book thus introduced, they doubt their own discernment, not the critic's infallibility, and send to the library for another volume recommended on the same authority. We need not be told that there are numerous instances of book-reviews as impartial as they are talented, and conveying a distinct and accurate idea of the scope and value of the work noticed. These are exceptions proving the rule; but the exceptions themselves, although careful and skilful analyses, are not criticism.

Our readers are of course aware that we are not alone in our reprehension of the abuses of this misnamed department of our literature. All men are agreed upon the point, including the reviewers themselves; and the only thing in which we are original is, in refraining from calling names, and charging the offenders roundly with ignorance, incapacity, and wilful dishonesty. This has been done again and again in most of the journals, from the quarterlies downwards; but instead of inquiring, in a philosophical spirit, into the origin of the evil, these works are accustomed to occupy themselves with such superficial questions as the advantage or disadvantage of the anonymous. The reason is, that they confound the art of criticism with mere opinion. 'Give us the name of the reviewer,' say the enemies of the anonymous, 'and we shall be able to tell what credit his verdict deserves: give us the name of the reviewer, and he will not dare to subject himself to the accusation either of falsehood or stupidity.' This is a very humble demand, and a very unimportant one. In most of the great reviews the writers' names are sufficiently well known, but that is no

guarantee for their good faith. It is not the name we want, but the thing: we want criticism. In a word, we have many critiques in our literature, but no criticism in the true meaning of the term. The critiques may stumble upon the truth—or not: it is all chance, since they are not based upon understood premises, not the application of recognised laws. They are the mere expression of individual opinion; and being wholly independent of any common theory, they may, and do differ from each other *toto calo*, without exciting any doubt as to the critic's ability. When we see two opposite judgments pronounced in two reviews of equal character, we perhaps ascribe the difference to party or personal motives; when very possibly, in the case in question, such motives may have had no existence. The reason simply is, that we have no ultimate authority to refer to—that, in the midst of all the luxuriance of our literature, it wants the grand element of criticism. This gives a hardness and meagreness to our common reviews, which is not found to the same extent in those of Germany or France, where the philosophy of art is more generally studied.

Criticism, though not aesthetics, but merely a practical application of their laws, possesses a higher intellectual dignity than the proudest of our quarterly reviews are conscious of. But it is not beholden for its dignity to the vague or mystical: it is, on the contrary, so practical and distinct, as to have every capacity for being reduced by careful study to a science; and to this object the best energies of our literati should be consecrated. In England, the dawn of aesthetics only begins to touch with a faint light the pictorial and musical arts; while in the other countries we have mentioned, it is likewise felt in literary criticism. Not that criticism is anywhere as yet what it should be, and will be; but already it possesses on the continent a higher tone, and exhibits a more catholic spirit. It does not confine itself to mean and paltry details, but essays to grasp the whole subject; and throwing aside party and personal considerations, it regards the work it chooses to examine as a contribution to the literature of the age, or of the world.

When we state—and we wish to do so in the broadest manner—that our literature is deficient in the essential element of criticism, we must not be supposed to advocate the publication of elaborate theories laying down the literary law. There is no such wholesale way as this of building up a science. It must be the gradual production of many minds, and many conflicting opinions, and the meanest of us all may lend his aid to the work. No one, for instance, should presume to deliver a judgment upon any work, in any department of taste, without trying it by the æsthetical laws, or, in other words, without giving a reason for the faith that is in him. If this rule were observed, we should not long want a common standard, or a public capable of judging of the *dicta* of its self-installed teachers. If this rule were observed—if criticism became really the System it ought to be—no man would stultify himself for friend or foe by bestowing one iota of praise or blame beyond the deserts of his author.

If an author were to say to his publisher, 'Here is a chemical speculation, to which I am sure to obtain the sanction of Liebig, because he is a personal friend of mine'—how the man of books would stare! Why does he not stare when his author tells him that, for the same reason, he can obtain for a certain work the praise of a certain review? Because, criticism having made no approach to a system, no collusion of a criminal nature can be suspected; the laudatory sentence, if very much out of the way, will pass for a mere eccentricity of taste; and the critic will suffer for his generous friendship neither as a man of honour nor as a man of letters. When a scientific speculation appears, it is on its own merits either accepted as a true theory, or rejected as a false hypothesis. If it possesses any value, it *must* be noticed, and the contribution it brings, whether great or small, added to the stock of the science of which it treats. A literary work is differently situated. It may be passed over or not at the pleasure of the critics, who have no science to protect or to

enrich; but even if subjected to their ordeal, it is rarely examined on its own merits, and almost never with reference to the philosophy of taste. The critic deals in small details; catalogues as deadly sins, if he has hostile views, those blunders that in reality modify but little the general effect; and in the case of poetry, more especially, never fails to measure rigidly the syllables, and try with his quill plectrum whether they are in tune.

The low state of criticism has of course an important reaction upon general literature. An author, conscious that his work will be tried by no lofty standard of art, never aspires, but in a few exceptional instances, beyond popularity; and if he did so, his bibliopolical patron, dreading, even while affecting to despise, the reviewing hydra, would not consent to publish anything beyond its common calibre. Genius is thus repressed by those whose task it should be to encourage and foster it; and the meanness of the public taste is blamed for what in reality is the fault of the public monitors. Every age, we know, produces its few great men, who rise triumphant over circumstances; but we never shall have an improved standard of national taste till a reformation is effected in criticism.

And now to the practical points of the subject. The brief laudatory notices we have adverted to are a mere mistake. The editors desire to express their thanks to the obliging publishers, and the best way to do this is simply to mention to their readers the contents of the volume or pamphlet received, instead of racking their brains for new terms of praise that nobody cares anything about. All that is wanted is a gratuitous advertisement in return for a gratuitous copy. The 'reviews' that fill up their sheet with interesting or amusing extracts have little in them objectionable but the title and the pretence. All they have to do, in order to be of real practical use, is to drop the critical name, and to aspire to give nothing more than pains-taking and impartial analyses, interspersed with such quotations as they know will be agreeable to their readers. As for the great essay-reviewers, all we will venture to suggest to such Tritons is, that they of all others are called upon to devote their unquestionable power towards the introduction into the national literature of the department of literary criticism. This they can do with very little sacrifice in other matters; but if they despise the hint, as coming from a minnow, we will proceed to prophesy, from unmistakable signs in the literary horizon, that the task will be undertaken by an entirely new order of teachers.

As for ourselves, having dared to preach, we will not shrink from practising, but on some other occasion endeavour to show the bearing which the want of a higher criticism has upon certain important departments of literature, and offer—though with more misgiving—some hints for the consideration of those who may be competent to supply the desideratum.

L. R.

EXPERIENCES OF A BARRISTER.

'THE WRIT OF HABEAS CORPUS.'

IN the month of February of the year following that which witnessed the successful establishment of the claim of Sir Harry Compton's infant son to his magnificent patrimony, Mr Samuel Ferret was travelling post with all the speed he could command towards Lancashire, in compliance with a summons from Lady Compton, requesting, in urgent terms, his immediate presence at the castle. It was wild and bitter weather, and the roads were in many places rendered dangerous, and almost impassable, by the drifting snow. Mr Ferret, however, pressed onwards with his habitual energy and perseverance; and, spite of all elemental and postboy opposition, succeeded in accomplishing his journey in much less time than, under the circumstances, could have been reasonably expected. But swiftly as, for those slow times, he pushed on, it is necessary I should anticipate, by a brief period, his arrival at his destina-

tion, in order to put the reader in possession of the circumstances which had occasioned the hurried and pressing message he had received.

Two days before, as Lady Compton and her sister, who had been paying a visit to Mrs Allington at the Grange, were returning home towards nine o'clock in the evening, they observed, as the carriage turned a sharp angle of the road leading through Compton Park, a considerable number of lighted lanterns borne hurriedly to and fro in various directions, by persons apparently in eager but bewildered pursuit of some missing object. The carriage was stopped, and in answer to the servants' inquiries, it was replied that Major Brandon's crazy niece had escaped from her uncle's house; and although traced by the snow-tracks as far as the entrance to the park, had not yet been recovered. Mrs Brandon had offered a reward of ten pounds to whoever should secure and reconduct her home; hence the hot pursuit of the fugitive, who, it was now supposed, must be concealed in the shrubberies. Rumours regarding this unfortunate young lady, by no means favourable to the character of her relatives as persons of humanity, had previously reached Lady Compton's ears; and she determined to avail herself, if possible, of the present opportunity to obtain a personal interview with the real or supposed lunatic. The men who had been questioned were informed that only the castle servants could be allowed to search for the missing person, either in the park or shrubberies; and that if there, she would be taken care of, and restored to her friends in the morning. The coachman was then ordered to drive on; but the wheels had not made half-a-dozen revolutions, when a loud shout at some distance, in the direction of the park, followed by a succession of piercing screams, announced the discovery and capture of the object of the chase. The horses were urged rapidly forward; and ere more than a minute had elapsed, the carriage drew up within a few yards of the hunted girl and her captors. The instant it stopped, Clara Brandon, liberating herself by a frenzied effort from the rude grasp in which she was held by an athletic young man, sprang wildly towards it, and with passionate intreaty implored mercy and protection. The young man, a son of Mrs Brandon's by a former husband, immediately re-seized her; and with fierce violence endeavoured to wrench her hand from the handle of the carriage-door, which she clutched with desperate tenacity. The door flew open, the sudden jerk disengaged her hold, and she struggled vainly in her captor's powerful grasp. 'Save me! save me!' she frantically exclaimed, as she felt herself borne off. 'You who are, they say, as kind and good as you are beautiful and happy, save me from this cruel man!'

Lady Compton, inexpressibly shocked by the piteous spectacle presented by the unhappy girl—her scanty clothing soiled, disarrayed, and torn by the violence of her struggles; her long flaxen tresses flowing disorderly over her face and neck in tangled dishevelment; and the pale, haggard, wild expression of her countenance—was for a few moments incapable of speech. Her sister was more collected: 'Violet,' she instantly remonstrated, 'do not permit this brutal violence.'

'What right has she or any one to interfere with us?' demanded the young man savagely. 'This girl is Major Brandon's ward, as well as niece, and *shall* return to her lawful home! Stand back,' continued he, addressing the servants, who, at a gesture from Miss Dalston, barred his progress. 'Withstand me at your peril!'

'Force her from him!' exclaimed Lady Compton, recovering her voice. 'Gently! gently! I will be answerable for her safe custody till the morning.'

The athletic fellow struggled desperately; but however powerful and determined, he was only one man against a score, nearly all the bystanders being tenants or labourers on the Compton estates; and spite of his furious efforts, and menaces of law and vengeance, Clara was torn from him in a twinkling, and himself hurled

with some violence prostrate on the road. 'Do not let them hurt the man,' said Lady Compton, as the servants placed the insensible girl in the carriage (she had fainted); 'and tell him that if he has really any legal claim to the custody of this unfortunate person, he must prefer it in the morning.'

Immediately on arrival at the castle, the escaped prisoner was conveyed to bed, and medical aid instantly summoned. When restored to consciousness, whether from the effect of an access of fever producing temporary delirium, or from confirmed mental disease, her speech was altogether wild and incoherent—the only at all consistent portions of her ravings being piteously-iterated appeals to Lady Compton not to surrender her to her aunt-in-law, Mrs Brandon, of whom she seemed to entertain an overpowering, indefinable dread. It was evident she had been subjected to extremely brutal treatment—such as, in these days of improved legislation in such matters, and greatly advanced knowledge of the origin and remedy of cerebral infirmity, would not be permitted towards the meanest human being, much less a tenderly-nurtured, delicate female. At length, under the influence of a composing draught, she sank gradually to sleep; and Lady Compton having determined to rescue her, if possible, from the suspicious custody of her relatives, and naturally apprehensive of the legal difficulties which she could not doubt would impede the execution of her generous, if somewhat Quixotic project, resolved on at once sending off an express for Mr Ferret, on whose acumen and zeal she knew she could place the fullest reliance.

Clara Brandon's simple history may be briefly summed up. She was the only child of a Mr Frederick Brandon, who, a widower in the second year of his marriage, had since principally resided at the 'Elms,' a handsome mansion and grounds which he had leased of the uncle of the late Sir Harry Compton. At his decease, which occurred about two years previous to poor Clara's escape from confinement, as just narrated, he bequeathed his entire fortune, between two and three thousand pounds per annum, chiefly secured on land, to his daughter; appointed his elder brother, Major Brandon, sole executor of his will, and guardian of his child; and in the event of her dying before she had attained her majority—of which she wanted, at her father's death, upwards of three years—or without lawful issue, the property was to go to the major, to be by him willed at his pleasure. Major Brandon, whose physical and mental energies had been prematurely broken down—he was only in his fifty-second year—either by excess or hard service in the East, perhaps both, had married late in life the widow of a brother officer, and the mother of a grown-up son. The lady, a woman of inflexible will, considerable remains of a somewhat masculine beauty, and about ten years her husband's junior, held him in a state of thorough pupillage; and, unchecked by him, devoted all her energies to bring about, by fair or foul means, a union between Clara and her own son, a cub of some two or three-and-twenty years of age, whose sole object in seconding his mother's views upon Clara was the acquisition of her wealth. According to popular surmise and report, the young lady's mental infirmity had been brought about by the persecutions she had endured at the hands of Mrs Brandon, with a view to force her into a marriage she detested. The most reliable authority for the truth of these rumours was Susan Hopley, now in the service of Lady Compton, but who had lived for many years with Mr Frederick Brandon and his daughter. She had been discharged about six months after her master's decease by Mrs Major Brandon for alleged impertinence; and so thoroughly convinced was Susan that the soon-afterwards alleged lunacy of Clara was but a juggling pretence to excuse the restraint under which her aunt-in-law, for the furtherance of her own vile purposes, had determined to keep her, that although out of place at the time, she devoted all the savings of her life, between eighty and ninety pounds, to procure 'justice' for the

ill-used orphan. This article, Susan was advised, could be best obtained of the lord chancellor; and proceedings were accordingly taken before the keeper of the king's conscience, in order to change the custody of the pretended lunatic. The affidavits filed in support of the petition were, however, so loose and vague, and were met with such positive counter-allegations, that the application was at once dismissed with costs; and poor Susan—rash suitor for 'justice'—reduced to absolute penury. These circumstances becoming known to Lady Compton, Susan was taken into her service; and it was principally owing to her frequently-iterated version of the affair that Clara had been forcibly rescued from Mrs Brandon's son.

On the following morning the patient was much calmer, though her mind still wandered somewhat. Fortified by the authority of the physician, who certified that to remove her, or even to expose her to agitation, would be dangerous, if not fatal, Lady Compton not only refused to deliver her up to Major and Mrs Brandon, but to allow them to see her. Mrs Brandon, in a towering rage, posted off to the nearest magistrate, to demand the assistance of peace-officers in obtaining possession of the person of the fugitive. That functionary would, however, only so far comply with the indignant lady's solicitations, as to send his clerk to the castle to ascertain the reason of the young lady's detention; and when his messenger returned with a note, enclosing a copy of the physician's certificate, he peremptorily decided that the conduct of Lady Compton was not only perfectly justifiable, but praiseworthy, and that the matter must remain over till the patient was in a condition to be moved. Things were precisely in this state, except that Clara Brandon had become perfectly rational; and but for an irrepressible nervous dread of again falling into the power of her unscrupulous relative, quite calm, when Mr Samuel Ferret made his wished-for appearance on the scene of action.

Long and anxious was the conference which Mr Ferret held with his munificent client and her interesting protégée, if conference that may be called in which the astute attorney enacted the part of listener only, scarcely once opening his thin, cautious lips. In vain did his eager brain silently ransack the whole armoury of the law; no weapon could he discern which afforded the slightest hope of fighting a successful battle with a legally-appointed guardian for the custody of his ward. And yet Mr Ferret felt, as he looked upon the flashing eye and glowing countenance of Lady Compton, as she recounted a few of the grievous outrages inflicted upon the fair and helpless girl reclining beside her—whose varying cheek and meek suffused eyes bore eloquent testimony to the truth of the relation—that he would willingly exert a vigour even *beyond* the law to meet his client's wishes, could he but see his way to a safe result. At length a ray of light, judging from his suddenly-gleaming eyes, seemed to have broken upon the troubled chambers of his brain, and he rose somewhat hastily from his chair.

'By the by, I will just step and speak to this Susan Hopley, if your ladyship can inform me in what part of the lower regions I am likely to meet with her?'

'Let me ring for her.'

'No; if you please not. What I have to ask her is of very little importance; still, to summon her here night give rise to surmises, reports, and so on, which it may be as well to avoid. I had much rather see her accidentally, as it were.'

'As you please. You will find her somewhere about the housekeeper's apartments. You know her by sight, I think?'

'Perfectly; and with your leave I'll take the opportunity of directing the horses to be put to. I must be in London by noon to-morrow if possible;' and away Mr Ferret hustled.

'Susan,' said Mr Ferret a few minutes afterwards, 'step this way; I want to have a word with you. Now, tell me are you goose enough to expect you will ever

see the money again you so foolishly threw into the bottomless pit of chancery?'

'Of course I shall, Mr Ferret, as soon as ever Miss Clara comes to her own. She mentioned it only this morning, and said she was sorry she could not repay me at once.'

'You are a sensible girl, Susan, though you *did* go to law with the lord chancellor! I want you to be off with me to London; and then perhaps we may get your money sooner than you expect.'

'Oh, bother the money! Is that *all* you want me to go to Lunnion for?'

Mr Ferret replied with a wink of such exceeding intelligence, that Susan at once declared she should be ready to start in ten minutes at the latest.

'That's a good creature; and, Susan, as there's not the slightest occasion to let all the world know who's going to run off with you, it may be as well for you to take your bundle and step on a mile or so on the road, say to the turn, just beyond the first turnpike.' Susan nodded with brisk good-humour, and disappeared in a twinkling.

An hour afterwards, Mr Ferret was on his way back to London, having first impressed upon Lady Compton the necessity of immediately relieving herself of the grave responsibility she had incurred towards Major Brandon for the safe custody of his ward, by sending her home immediately. He promised to return on the third day from his departure; but on the nature of the measures he intended to adopt, or the hopes he entertained of success, he was inflexibly silent; and he moreover especially requested that no one, not even Miss Brandon, should know of Susan Hopley's journey to the metropolis.

Mr Ferret, immediately on his arrival in town, called at my chambers, and related with his usual minuteness and precision as many of the foregoing particulars as he knew and thought proper to communicate to me. For the rest I am indebted to subsequent conversations with the different parties concerned.

'Well,' said I, as soon as he had concluded, 'what course do you propose to adopt?'

'I wish you to apply, on this affidavit, for a writ of *habeas ad sub.*, to bring up the body of Clara Brandon. Judge Bailey will be at chambers at three o'clock: it is now more than half-past two, and I can be off on my return by four at latest.'

'A writ of *habeas*!' I exclaimed with astonishment. 'Why, what end can that answer? The lady will be remanded, and you and I shall be laughed at for our pains.'

This writ of *habeas corpus* '*ad subjiendum*,' I had better explain to the non-professional reader, is the great *prerogative* writ, the operation of which is sometimes suspended by the legislature during political panics. It is grounded on the principle that the sovereign has at all times a right to inquire, through the judges of the superior courts, by what authority his or her subject is held in constraint. It issues, as a matter of right, upon the filing of an affidavit, averring that to the best of the belief of the deponent the individual sought to be brought up is illegally confined; and it is of the essence of the proceeding, that the person alleged to be suffering unlawful constraint should actually be brought before the 'queen herself'; that is, before one or more of the judges of the court which has issued the writ, who, if they find the *detention* illegal, the only question at issue upon this writ may discharge or bail the party. It was quite obvious, therefore, that in this case such a proceeding would be altogether futile, as the detention in the house of her guardian, under the sanction, too, of the lord chancellor, the *ex-officio* custodian of all lunatics—of a ward of alleged disordered intellect—was clearly legal, at least *prima facie* so, and not to be disturbed under a *habeas ad sub.* at all events.

'Perhaps so,' replied Ferret quite coolly in reply to my exclamation; 'but I am determined to try every means of releasing the unfortunate young lady from the

cruel thralldom in which she is held by that harridan of an aunt-in-law. She is no more really insane than you are; but at the same time so excitable upon certain topics, that it might be perhaps difficult to disabuse the chancellor or a jury of the impression so industriously propagated to her prejudice. The peremptory rejection by her guardian of young Burford's addresses, though sanctioned by her father: you know the Burfords?

'Of Grosvenor Street you mean—the East India director?'

'Yes, his son; and that reminds me that the declaration in that everlasting exchequer case must be filed to-morrow. Confound it, how this flying about the country puts one out! I thought some one had kidnapped her son, or fired Compton Castle at least. By the way, I am much deceived if there isn't a wedding there before long.'

'Indeed!'

'Yes, Miss Dalston with Sir Jasper's eldest hope.'

'You don't mean it?'

'They do at all events, and that is much more to the purpose. A fine young fellow enough, and sufficiently rich too'—

'All which rambling talk and anecdote,' cried I, interrupting him, 'means, if I have any skill in reading Mr Ferret, that that gentleman, having some ulterior purpose in view, which I cannot for the moment divine, is determined to have this writ, and does not wish to be pestered with any argument on the subject. Be it so: it is your affair, not mine. And now, as it is just upon three o'clock, let me see your affidavit.'

I ran it over. 'Rather loose this, Mr Ferret, but I suppose it will do.'

'Well, it is rather loose, but I could not with safety sail much closer to the wind. By the by, I think you had better first apply for a rule to stay proceedings against the bail in that case of Turner; and after that is decided, just ask for this writ, off-hand as it were, and as a matter of course. His lordship may not then scrutinise the affidavit quite so closely as if he thought counsel had been brought to chambers purposely to apply for it.'

'Cautious, Mr Ferret! Well, come along, and I'll see what I can do.'

The writ was obtained without difficulty; few questions were asked; and at my request the judge made it returnable immediately. By four o'clock, Mr Ferret, who could fortunately sleep as well in a postchaise as in a feather-bed, was, as he had promised himself, on his road to Lancashire once more, where he had the pleasure of serving Major Brandon personally; at the same time tendering in due form the one shilling per mile fixed by the statute as preliminary travelling charges. The vituperative eloquence showered upon Mr Ferret by the major's lady was, I afterwards heard, extremely copious and varied, and was borne by him, as I could easily believe, with the most philosophic composure.

In due time the parties appeared before Mr Justice Bailey. Miss Brandon was accompanied by her uncle, his wife, and a solicitor; and spite of everything I could urge, the judge, as I had foreseen, refused to interfere in the matter. The poor girl was dreadfully agitated, but kept, nevertheless, her eyes upon Mr Ferret, as the source from which, spite of what was passing around her, effectual succour was sure to come. As for that gentleman himself, he appeared composedly indifferent to the proceedings; and indeed, I thought, seemed rather relieved than otherwise when they terminated. I could not comprehend him. Mrs Brandon, the instant the case was decided, clutched Clara's arm within hers, and, followed by her husband and the solicitor, sailed out of the apartment with an air of triumphant disdain and pride. Miss Brandon looked round for Ferret, but not perceiving him—he had left hastily an instant or two before—her face became deadly pale, and the most piteous expression of hopeless despair I had ever beheld broke from her troubled but singularly-expressive eyes. I mechanically followed, with a half-formed purpose of

remonstrating with Major Brandon in behalf of the unfortunate girl, and was by that means soon in possession of the key to Mr Ferret's apparently inexplicable conduct.

The Brandon party walked very fast, and I had scarcely got up with them as they were turning out of Chancery Lane into Fleet Street, when two men, whose vocation no accustomed eye could for an instant mistake, arrested their further progress. 'This lady,' said one of the men, slightly touching Miss Brandon on the shoulder, 'is, I believe, Clara Brandon?'

'Yes she is; and what of that, fellow?' demanded the major's lady with indignant emphasis.

'Not much, ma'am,' replied the sheriff's officer, 'when you are used to it. It is my unpleasant duty to arrest her for the sum of eighty-seven pounds, indorsed on this writ, issued at the suit of one Susan Hopley.'

'Arrest her!' exclaimed Mrs Brandon; 'why, she is a minor!'

'Minor or major, ma'am, makes very little difference to us. She can plead that hereafter, you know. In the meantime, miss, please to step into this coach,' replied the officer, holding the door open.

'But she's a person of unsound mind,' screamed the lady, as Clara, nothing loath, sprang into the vehicle.

'So are most people that do business with our establishment,' responded the imperturbable official, as he shut and fastened the door. 'Here is my card, sir,' he added, addressing the attorney, who now came up. 'You see where to find the lady, if her friends wish to give bail to the sheriff, or, what is always more satisfactory, pay the debt and costs.' He then jumped on the box, his follower got up behind, and away drove the coach, leaving the discomfited major and his fiery better-half in a state of the blankest bewilderment!

'Why, what is the meaning of this?' at length gasped Mrs Brandon, fiercely addressing the attorney, as if he were a *particeps criminis* in the affair.

'The meaning, my dear madame, is, that Miss Clara Brandon is arrested for debt, and carried off to a spunging-house; and that unless you pay the money, or file bail, she will to-morrow be lodged in jail,' replied the unmoved man of law.

'Bail! money! How are we to do either in London, away from home?' demanded the major with, for him, much emotion.

I did not wait to hear more, but, almost suffocated with laughter at the success of Ferret's audacious *ruse*, hastened over to the Temple. I was just leaving chambers for the night—about ten o'clock I think it must have been—when Ferret, in exuberant spirits, burst into the room.

'Well, sir, what do you think now of a writ *ad sub.*?'

'Why, I think, Mr Ferret,' replied I, looking as serious as I could, 'that yours is very sharp practice; that the purpose you have put it to is an abuse of the writ; that the arrest is consequently illegal; and that a judge would, upon motion, quash it with costs.'

'To be sure he would: who doubts that? Let him, and welcome! In the meantime, Clara Brandon is safe beyond the reach of all the judges or chancellors that ever wore horse-hair, and that everlasting simpleton of a major and his harridan wife roaming the metropolis like distracted creatures; and that I take to be the real essence of the thing, whatever the big-wigs may decide about the shells!'

'I suppose the plaintiff soon discharged her debtor out of custody?'

'Without loss of time, you may be sure. Miss Brandon, I may tell you, is with the Rev. Mr Derwent at Brompton. You know him: the newly-married curate of St Margaret's that was examined in that will case. Well him: he is an intelligent, high-principled man; and I have no doubt that, under his and Mrs Derwent's care, all trace of Miss Brandon's mental infirmity will disappear long before she attains her majority next June twelvemonth; whilst the liberal

sum per month which Lady Compton will advance, will be of great service to him.'

'That appears all very good. But are you sure you can effectually conceal the place of her retreat?'

'I have no fear: the twigs that will entangle her precious guardians in the labyrinths of a false clue are already set and limed. Before to-morrow night they will have discovered, by means of their own wonderfully-penetrative sagacity, that Clara has been spirited over to France; and before three months are past, the same surprising intelligence will rejoice in the discovery that she expired in a *maison de santé*—fine comfortable repose, in which fool's paradise I hope to have the honour of awakening them about next June twelvemonth, and not as at present advised before!'

Everything fortunately turned out as Mr Ferret anticipated; and when a few months had glided by, Clara Brandon was a memory only, save of course to the few intrusted with the secret.

The whirligig of time continued as ever to speed on its course, and bring round in due season its destined revenges. The health, mental and bodily, of Miss Brandon rapidly improved under the kind and judicious treatment of Mr and Mrs Derwent; and long before the attainment of her majority, were pronounced by competent authority to be thoroughly re-established. The day following that which completed her twenty-first year, Mr Ferret, armed with the necessary authority, had the pleasure of announcing to the relict of Major Brandon (he had been dead some months), and to her brutal son, that they must forthwith depart from the home in which they, to the very moment of his announcement, thought themselves secure; and surrender every shilling of the property they had so long dreamt was their own. They were prostrated by the intelligence, and proved as mean and servile in the hour of adversity, as they had been insolent and cruel in the day of fancied success and prosperity. The pension of three hundred pounds a year for both their lives, proffered by Miss Brandon, was eagerly accepted; and they returned to the obscurity from which they had by accident emerged.

About six months afterwards, I had the pleasure of drawing up the marriage settlements between Clara Brandon and Herbert Burford; and a twelvemonth after, that of standing sponsor to one of the lustiest brats ever sprinkled at a font: none of which delightful results, if we are to believe Mr Ferret, would have ever been arrived at had not he, at a very critical moment, refused to take counsel's opinion upon the virtues, capabilities, and powers contained in the great writ of *habeas corpus ad subjiciendum*.

GOLD MINES OF SCOTLAND.

THE logic of children is sometimes puzzled with the question, whether a pound of feathers or a pound of lead is the heavier? 'A pound of lead,' says at once the thoughtless urchin, who is not destined to be a Locke or a Descartes. Fallacies of this description perpetually pervade the full-grown children of mankind, and in nothing have they been better exhibited than in the search for gold. The pound worth of gold has been considered so much more valuable than the pound worth of anything else, that people have contentedly given two, three, and four pounds for it. King James VI. expended about L.3000 sterling—a large sum in his day—in searching for gold on Carnwath Moor; but he never obtained more than about three ounces—not quite L.12 worth. This was so extravagantly ill-paying a concern, even though its returns were in gold, that the monarch declined to push it farther. Perhaps if he had got L.1000 worth of gold for his L.3000 worth of labour, the mining operations would have been set down as highly prosperous, and of great advantage to the community.

It was at the conclusion of this disagreeable experiment that the king was strongly urged by a sanguine speculator, named Stephen Atkinson, to renew the na-

tional hunt for the precious metal, and thus 'to make his majesty the richest monarch in Europe—yea, in all the world.' Mr Atkinson, like many other speculators, discovered the main weakness of the person to whom he addressed his project, and assailed him in that direction with great courage and skill. James had been often compared to King Solomon, and he was accustomed to hear the comparison developed in various forms. Atkinson made a bold addition to the compliment, by showing that he possessed the united virtues of David and of his wise son, 'in respect of the wonderful resemblance which many of his majesty's gracious deeds have with the doings of the prophet David and Solomon the wisest.' Accordingly there is a series of parallels between the acts of these two kings towards Israel, and the acts of the modern Solomon towards his Scottish subjects, which concludes with the remark: 'Who doth not see that the king's majesty, the prince, and his subjects, do reap as great benefits from Almighty God, as did the Israelites by the means of King Solomon, or may do in riches, by Scotland?'

From a perusal of Mr Atkinson's book, one might not unaptly adopt the conclusion that gold was a staple produce of Scotland—that it had been extracted in great abundance—and that, from time to time, it afforded employment to a considerable mining population. He speaks of Crawford Moor and Friar Moor in Lanarkshire, and Wanlock Moor in Dumfriesshire, together with a small vale called Glengaber in Peeblesshire, as the chief auriferous districts. They form, it may be remarked, properly one district, being all of them portions of a mountainous region in the centre of the south of Scotland, where rocks of the transition series prevail. To this day, we believe, the shepherds occasionally find grains of gold in the channels of the streams which water this district. A few centuries ago, the imaginations of the people were set on fire by the comparatively promising quantities which were discovered. Atkinson says, of the places which he enumerates, that he had tried them all, and in all gold was to be found. 'You shall always,' he says, 'find skilful seekers and discoverers thereof dwelling near unto these foresaid places for to use the trough or skewer, but not very perfect in the bridle, nor any at all in the art of extracting. Some of these laborious Scotsmen know the natural gold perfectly, and too well—I mean that gold gotten in valleys, not upon cold places—namely, on high mountains and mosses. . . . The vulgar sort of Scotsmen usually sought for it on these moors after a great rain, and after the speats [floods] of rain had run his course: and this rain, or force of water, brought down no other gold than gold which had been removed by the force of waves' flood, and that gold was and is called superficial gold to this day.' He then proceeds to describe the operation of the deluge on the crust of the globe; and in continuation, says—'And then, even at that time, natural gold and silver (which now is found to be in combs and valleys) was forced and torn from his dwelling-place—namely, God's treasure-house in the earth, &c.; and thither even our Scots gold, which is now found in stems or in grains and pieces, did descend or was washed down. In which valleys, combs, skirts of hills, or cloughs, even until this present day, it hath laid still or not been removed, except after a great speat of rain, the force whereof doth break and wear the superficies of the earth, but not the solid earth; after which the Scots men, and women, and children run to seek for it, and do find it still, even to this day.'

We are not responsible for the distinctness or consistency of Mr Atkinson's statements. He appears to have been peculiarly liable to the hazy influence which often surrounds the dreams of speculators. In the above extracts, he evidently alludes to *washings* for gold in the alluvial matter in the bottoms of valleys and beds of rivers, and seems to entertain the idea that there was some grand storehouse of the metal to be discovered by diligent research in the recesses of the earth. He could

* The Discoverie and Historie of the Gold Mines in Scotland. By Stephen Atkinson. Written in the year 1619. Printed for the Bannatynes Club, 1825.

sometimes become eloquent and luxurious in his descriptions, as speculators are often wont to be. He describes the proceedings of his predecessors in gold-finding after this eloquent fashion:—One 'Cornelius, a lapidary,' of German origin, had approached our gold mines with a recommendation from Queen Elizabeth to the king. 'And then Cornelius went to view the said mountains in Clydesdale and Nydesdale, upon which mountains he got a small taste of small gold. This was a whetstone to sharpen his knife upon; and this natural gold tasted so sweet as the honeycomb in his mouth. And then he consulted with his friends at Edinburgh, and by his persuasions provoked them to adventure with him, showing them at first the natural gold, which he called the temptable gold, or alluring gold. It was in stems, and some like unto birds' eyes and eggs: he compared it unto a woman's eye, which entiseth her lover into her bosom.' Cornelius was not inferior to his class in speculative extravagance. He found in his golden dreams a solution for the question regarding the poor. He saw Scotland and England 'both oppressed with poor people which beg from door to door for want of employment, and no man looketh to it.' But all these people were to find good and profitable employment if his projects were adopted. We are not accustomed to consider our countrymen inferior in energy and enterprise to the Germans. Yet Cornelius stated, that if he had been able to show in his own country such indications of mineral wealth as he had found in Scotland, 'then the whole country would confederate, and not rest till young and old that were able be set to work thereat, and to discover this treasure-house from whence this gold descended; and the people, from ten years old till ten times ten years old, should work thereat; no charges whatsoever should be spared, till mountains and mosses were turned into valleys and dales, but this treasure-house should be discovered.'

It appears that Cornelius so far prevailed on the Scots to 'confederate,' that they raised a stock of £5000 Scots, equal to about £416 sterling, and worked the mines under royal privileges. Atkinson, whose object it was to put these operations in their most favourable light, says that eight pounds' weight of gold was extracted by the company, the value being £450 sterling. 'Cornelius,' he says, 'had six score men at work in valleys and dales. He employed both lads and lasses, idle men and women, which before went a-begging. He profited by their work, and they lived well and contented.'

Atkinson tells a story which will be found applied, in Scott's 'Tales of a Grandfather,' to different persons and an earlier period. He says that in the days of the Regent Morton, a Dutchman, with the very British name of Abraham Grey, worked the Scots mines, and made out of their gold 'a verie faire deep bason,' which 'contained, by estimation, within the brims thereof, an English gallon of liquor.' He continues: 'The same bason was of clean, neat, natural gold. Itself was then filled up to the brim with coined pieces of gold, called *unicorns*; which bason and pieces both were presented unto the French king by the said regent, the Earl of Morton, who signified upon his honour unto the king, saying, "My lord, behold this bason and all that therein is: it is natural gold, gotten within this kingdom of Scotland, by a Dutchman named Abraham Grey;" and Abraham Grey was standing by, and affirmed it upon a solemn oath. But he said unto the said king that he thought it did engender and increase within the earth, and that he observed it soe to do by the influence of the heavens.' It is not easy to conceive how such a meeting could have occurred between the king of France and the Regent Morton. Sir Walter Scott makes King James to present the vessel filled with gold bonnet-pieces to the French and Spanish ambassadors. Mr Atkinson revels in many other luxurious descriptions of the Scottish gold-seekers; and among others, the efforts of his contemporary, Sir Bevis Bulmer, Queen Elizabeth's Master of the Mint. We need not overwhelm our readers with more specimens of his magniloquence, but content ourselves with the general moral to be derived from his book—that those who speak about the finding of gold, seem always so dazzled with the

brilliance of their subject, that sober truth is not to be expected from them, and they exaggerate trifles with the wild excitement of a mob propagating a rumour. The chief district in which these adventurers hunted for the precious metal was Wanlock Head. It is now celebrated for its lead mines, whence fortunes have been derived; but it would appear to have been ransacked by the impoverished gold-seekers for a full century before any one condescended to enrich himself by attending to the humbler metal. The clergyman of the parish says, in the 'New Statistical Account'—'A mine has been cut a considerable way into one of the mountains close to the Wanlock Stream, which is supposed to have been cut in search of gold. For such as wish to procure a little in a state of purity, or for the purpose of being formed into a ring, &c. it is still collected by the miners, though not in any great quantity. It is generally found at the bottom of the glens, of a granular form, disseminated among rocks, and mixed with sand and gravel. During the last four years two specimens have been found which weighed respectively ninety and sixty grains.' The two together would be worth about a pound.

SPORT IN THE PETRIFIED FOREST.

Most persons who have read anything about Egypt, know that in the neighbourhood of Cairo there exists what is called the Petrified Forest. Geological travellers generally visit the spot in a devout spirit of scientific research. They set out with the full determination of filling a certain number of pages of their note-books with acute observations and ingenious theories: they go forth in a rigid spirit of inquiry: above all things, they are on their guard against being humbugged. From the moment they bestride their donkeys' backs, their countenances assume all the severity of philosophical investigation; and it is certainly not their fault if the world is no wiser after all their exertions.

As a resident in Egypt, I used often to make a trip to the Petrified Forest, merely for the sake of enjoying the fine bracing air of the hills. On one occasion I remember going out with a small party to look for gazelles; and I will take the opportunity of describing what is to be seen in an account of our day's proceedings. My companions were two Germans and two Englishmen—one established in Cairo, the other on a visit from Alexandria. The expedition was decided on the previous evening; and our Teutonic friends undertook to provide the necessary refreshments. There was great talk of the excellent sport to be anticipated, and some difference of opinion arose as to the disposal of the various gazelles we were to bring home in proof of our prowess. At length, however, a fair division was made among the ladies and gentlemen of our acquaintance; and we separated, all promising to be at the rendezvous next morning precisely at half-past six.

It will be but courteous if I introduce my friends more particularly to the reader. In the first place, there was Mr M—, the representative of one of the commercial houses of Alexandria, and having some claim to the dignified appellation of a 'Consul.' In Europe, the importance of this position will scarcely be appreciated, and it would be difficult to convey an idea of it without going into too lengthy details. Suffice it to say, that a flag on the roof, and a coat of arms over the door of a house, convert it into an inviolable sanctuary. The consul, who generally exerts completely arbitrary power over the subjects of the country he represents, is always an influential person with the government; and if he sometimes fails to be successful in procuring *redress* for an injury done to any one to whom he desires to afford protection, he always obtains the infliction of *punishment* for an offence. No wonder, then, that he is looked upon with a kind of awe, and that the Arabs have formed ridiculously exaggerated ideas of his importance. My friend M— would, therefore, have been a valuable companion had there been the slightest reason to apprehend insult. As there was not, we coveted his society for his own personal merits, which were great—for he was a jovial, good-hearted fellow; and

though he had never been in England, spoke our language capitally.

The same thing may be said of my other German friend Herr Fist—I mean with reference to his knowledge of English—for though he was one of the best-hearted young men I have ever met, he was very far from jovial. I can still see his calm, melancholy face, and lofty intelligent forehead, as if he were before me at this moment. I always took pleasure in his company, although I had generally to furnish the greater part of the conversation. This, you will suggest, may have been no hardship; but I can assure you that among talkative people I am regarded as very taciturn.

Perhaps, however, these details do not interest you. Let me, then, hasten to introduce my two English friends, who rejoiced in the names of Messrs Fox and Cog. The first was rather scientifically inclined, and evidently had some sly notions of scientific research in reserve; but knowing the temper of his consorts, he kept these heterodox tendencies as much as possible to himself. He did not do, as another friend of mine once did—namely, bring out a spare donkey for the purpose of carrying back specimens of the Petrified Forest, but he quietly chose an enormous brute, that looked as if it could have carried half a museum in addition to its geological rider. Mr Fox was a native of Liverpool; and though I may be thought to speak rather irreverently of his studious tendencies, I must freely confess to having drunk more tea and eaten more preserves at his hospitable table than at any other house in Egypt. His literary tastes and extensive knowledge made him an excellent travelling companion; but we were compelled on this occasion to remind him more than once that we were not travelling, but merely looking out for gazelles and an appetite.

Mr Cog was the superintendent of one of the cotton-factories of Boulac; and having a rank in the pasha's service, turned out in full Stambouli costume. He was one of those long-headed Englishmen who contribute by their straightforward manners and energetic character to make our country respected in the East, where we certainly are looked upon as a very superior class of beings to all other Franks.

It was past seven—in spite of our industrious intentions—before we were all ready to start; but when once in the saddle, we rattled away through the Sookhs at a fine rate, followed by a troop of donkey-boys and servants carrying our guns and ammunition. Two large saddle-bags contained our supply of creature comforts; for we had resolved to lunch out at the coal-pit, and return home to a late dinner.

I shall say nothing at present of the streets of Cairo, although the portion we traversed is rarely visited by professed tourists, not being set down in the guide-books. We wound our way along a variety of little lanes, flanked often by half-ruined houses, with a tall minaret leaning over here and there in a most terribly insecure way. Half the shops were closed, not because it was too early—the natives always get up with the sun—but because prosperity had departed. The palmy days of Cairo have long ago passed away; and in most of the quarters a great proportion of the houses are uninhabited. Many of the streets, however, presented a lively aspect; and some of the market-places were so crowded by vociferous customers, that we could scarcely get along. In these unaristocratic regions we don't remark the gorgeous variety of costume which one is accustomed to think of in connection with Eastern life: dingy turbans, threadbare tarbooshes, blue shirts, ragged shawls, and naked feet, may be enumerated as the principal characteristics that present themselves: a shabby-genteel Copt, with black turban, sombre dress, and inkstand stuck like a pistol into his girdle, alone perhaps aspires to the dignity of shoes and stockings.

Escaping from the close streets of the city, we gallop with delight through the sombre archway of the Bab-en-Nasr into the City of the Tombs. Here the air is pure, and the sun is bright; everything conspires to fill the mind with joy; and I defy the most obstinate moralist—after emerging from the clammy, cold atmosphere of the

low quarters of Cairo—to conjure up a single gloomy idea, in spite of the hundreds of fresh white tombstones that meet the eye on every side, and the crumbling monuments of ancient kings, near which the path, as we proceed, leads us.

It was a happy holiday, and we were all fully resolved to enjoy it. M——'s servant led a fine white horse, which the master occasionally mounted to take a gallop up the slopes of the hills. The rest of us stuck to our donkeys, and enlivened the ride by a variety of anecdotes, which succeeded one another with marvellous rapidity. We soon reached the rocky pass that leads round the base of what is called the Gebel-el-Ahmar, or Red Mountain—an immense detached hill of volcanic origin—into the valley of the Mokattam range. A few minutes took us out of sight of the city of Cairo, and the vast Egyptian plain, that had been developing as we ascended; and we found ourselves in the midst of a series of barren hills—ay, as barren as though they were a thousand miles from the beneficent Nile. To our right was a long line of precipices, broken here and there by a rugged defile, one of which leads to a little spring that pours forth its limpid waters at the foot of a solitary tree; to our left a series of sloping hillocks, piled, as it were, one above the other, soon closed in the view; behind us were the purple peaks of the Red Mountain; and in front, as is usual in the Desert, the long flat valley we had entered seemed, by an optical illusion, to conclude with a vast amphitheatrical sweep.

When we had jogged about half-way up this valley, we were passed by a group of English tourists, riding furiously along on horseback, and casting keen glances on every side to collect geological facts. In two or three minutes they dashed round the corner of the range of precipices, and were lost to view. I may mention that about half an hour later we caught sight of them scouring along a distant valley on their return to Cairo with, as we afterwards learned, a very interesting budget of observations. Egypt, it appears, is a country in which he who runs may read.

A rugged ravine to the right, at the end of the valley, leads to the top of the range of hills. Here the petrified wood begins. Two or three trunks of trees, half imbedded in the soil, and broken into lengths of five or six feet, present themselves at once. The whole ground, too, is covered with smaller pieces, not seemingly at all diminished in number, despite the industry of specimen collectors, who are generally content not to go farther than this spot.

As we proceeded, a splendid view of the Valley of the Nile, and successively of all the Pyramids from Gizeh to Sakkarah, was obtained through the mouth of what is called the Valley of the Wanderings, that stretches from the village of Toura to the Red Sea. This panoramic picture, enveloped in a slight mist, seemed to move slowly as we ourselves proceeded across the opening between the rugged ranges of Mokattam and Massara, and induced us to linger for a while. But we soon began descending from the elevation we had obtained, and at length came to the proposed field of active exertion.

The northern side of the Valley of the Wanderings, unlike the southern, which is nearly precipitous, sweeps upwards in vast slopes, intersected by little sandy valleys, where a few green plants and bushes, kept alive by the dews of night, occasionally attract whole troops of gazelles. On reaching there, we put foot to ground; and M——, who was a keen sportsman, went forward, slightly stooping, according to the true Bedouin fashion, to look out for the game. It is often extremely difficult in the desert, when the sun's rays beat scorchingly on the ground, and dazzle the eyes, to distinguish a herd of gazelles. It generally happens that you come close upon them, and have your attention attracted by seeing them scud along like a flash of light. So it happened in this case. M—— was creeping over a stony swell, and looking far ahead, when half-a-dozen of these beautiful creatures went bounding away under his very nose. 'There—there!' 'Where—where?' 'Hennak—hennak!' shouted Franks and Arabs. Bang—bang! went the fowling-pieces; but before M—— could

bring his rifle to bear, the frightened gazelles were disappearing over a distant hill. A little cloud of dust beaten up close alongside of them, showed that he was a good shot; and the sharp scolding he gave us for shouting and shooting at random, proved that, like a true sportsman, he took his failure to heart.

'Better luck next time,' said we; and on we went, cautiously examining every valley before we entered it. There were thousands of footprints, and other traces of the gazelle; but we got among the rocks and hills again without having had an opportunity to pull another trigger.

A shower of rain, discharged by a huge cloud that had crept up from the east without our perceiving it, drove some of us to shelter; the others found that a bottle of Madeira had been broken in the saddle-bags, and drank what could be saved, as an internal greatcoat. The sky soon cleared up again; and after riding through some rough ground, we got down into the great valley, and about eleven o'clock reached our destination.

This was what is called the shaft or coal-pit—one of the follies of Mohammed Ali. For the last twenty years no subject has occupied his mind more than this. He had been told of the immense advantage the possession of coal has proved to England, he had made up his mind that Egypt should be a manufacturing country, and he had resolved that coal should be found in his dominions. An immense number of adventurers have made fortunes out of the pasha by encouraging this weakness. Every year two or three reports are sent in of discoveries of coal-beds. He believes them all, orders shafts to be sunk, and never gives up until he has spent enormous sums of money to no purpose. Some years ago, a European, who had been made a bey, presented himself before his highness with two or three black stones found in the Petrified Forest, which he stated to be pure coal. 'Peki—peki!' exclaimed the pasha: 'I have been seeking this precious mineral in Kordofan and Sennaar, and I find it within three hours of Cairo! Sink a shaft directly! Sink a shaft! Let Burmanchan and Mangustar look out! Egypt will be the great manufacturing country after all! She produces cotton, she produces flax'—The worthy pasha was interrupted by a stubborn, ignorant old Turk, who suggested that the black stones should be put into a fire, in order to see whether they would burn. The pasha looked at the unfortunate sceptic's beard, as if he would have pulled it off; but his good sense predominating, he ordered Khosrew Bey, the chief interpreter, and several other functionaries, to go to the kitchen, and be witnesses of the experiment. The deputation accordingly went; the stones were put upon the fire; and a variety of attempts were made to induce them to ignite; but though they got red-hot, they would not burn. Solemn faces were made by the courtiers, who knew the reception they would meet with if they returned with an unfavourable report. Mohammed Ali had got it into his head that all Turks are 'tors,' 'bulls,' meaning 'asses;' and that they are jealous of all Europeans, and disposed to discredit their ideas. He was not wrong in the main; but he pushed the idea too far. After the cook had been exhausting his breath by blowing on the stones for half an hour, Khosrew Bey, who ran the risk of singeing his moustaches in his anxiety, exclaimed, 'Wallah! it burns! Wallah! it burns!' 'Do not swear, oh Khosrew,' said the cook, wiping the perspiration from his forehead: 'I am nearly dead, and shall certainly give up the ghost before this accursed stone takes fire!'

Meanwhile the European, who had not prepared himself for this experiment, had recovered from his surprise, and was explaining to the pasha that he did not mean to say that the specimens he had presented were *real coal*, but that they indicated the presence of coal beneath the surface of the earth. 'Why did you not say so before?' at length cried the pasha. 'There is poor Khosrew in the kitchen endeavouring to make the stones burn. Call him back, call him back; it is all a mistake. And you, sir, listen to me: go to Baki Bey, get all the men you require, and sink a shaft at once.'

The works were accordingly begun; and it seems they

intend to go on until coal is found—even should it prove necessary to bore through to the antipodes. Every year the shaft is carried down through all sorts of strata some hundred feet, and no one ever talks of giving it up, or expects to find coal at last.

Immense mounds of material had been thrown up near the shaft. These at first concealed the little house and the sheds in which the guardians dwell; and as they looked exactly like portions of the desert, it was some time before we struck into the right direction after getting down into the valley. At length, as I before stated, we reached our destination, and alighted. The more lazy and hungry went immediately to look for a shady place, whilst we—that is to say, myself and the scientific Fox—amused ourselves by dropping stones down the shaft, and counting the seconds that elapsed before they were heard to reach the bottom. I think twelve seconds was about the result. We were going to make still further progress in the search after useful knowledge, when a cry arose, 'Herr Fist is eating all the lunch!' We accordingly rushed to the rescue; and our appetites being good, fell to in right good earnest. When the more solid viands had disappeared, along with the greater part of the wine, we began most industriously sucking oranges, and proposed to go on a geological excursion up the long slope in front of us. Though this was rather *infra dig*, it was resolved upon, and away we started.

I am almost sorry that I did not choose to describe another of my visits to the Petrified Forest, where, as I have already hinted, my friend A—took out a spare donkey to load with specimens; and on arriving on the ground, wished aloud he had brought a camel, and no doubt in his heart regretted he could not carry away the whole forest! How we laughed as, in slowly ascending the steep, he collected at every fifty yards a monstrous pile of blocks of petrified wood, which he could scarcely lift in both hands, and from which he made up his mind with a sigh to select on his return. We had not proceeded far, before he had gathered sufficient to build a good-sized house. It is true that L—and I were waggishly inclined, and added a round number of huge blocks that had nothing to recommend them but their size; but in addition to making these piles, A—actually carried along with him an enormous carpet-bag, into which there was a perfect shower of curious specimens, partly approved by his own severe judgment, partly thrown in wilfully by us. His greatcoat pockets also were made receptacles for all sorts of interesting pebbles—black, white, and red—so that he had not proceeded above a quarter of a mile in that broiling sun before he was absolutely compelled to come to a stand-still, weighed down by some hundredweight of petrified wood and agates. Imagine his indignation, on examining his carpet-bag and his pouches, at finding some prodigious masses of puddingstone and common flints. Having hurled these away, and rejected also with regret some fragments containing knots and others with portions of bark, my indefatigable friend proceeded; but ere long he was again compelled to sit down exhausted, and pronounce condemnation once more on a large assortment of rubbish. On our return towards the shaft there was a long halt at every pile, and a regular debate on the value of each specimen, I and L—endeavouring to make up for our previous practical jokes by turning ourselves into beasts of burthen. At length we reached the halting-place laden with stones, to the great astonishment of the Arabs. It was found, however, that no donkey could carry for any distance all we had collected; and in moody melancholy A—threw away two small trunks of trees which he had fondly hoped to be able to transport *via* Alexandria to Europe!

But, as I have said, this was on another occasion. On the present, none of us was enthusiastic enough to afford much scope for merriment of that kind. M—would rather have seen a troop of gazelles than all the petrified forests that ever existed; Cog had often been there before; Herr Fist's curiosity was moderate; Fox certainly exhibited some interest, but the collection he made was too trifling to laugh at. For my own part, during my travels

I had a foolish prejudice against bringing away relics and specimens, so that I have nothing scarcely but my reminiscences remaining.

I have no theory on the subject of the Petrified Forest. An immense number of trees have evidently been converted into stone on this spot. Hundreds of trunks, sixty or seventy feet long, may be counted from whatever point you choose. It would appear that they were converted into stone whilst upstanding, for they are all broken into lengths of about five feet, as if in falling down. The whole ground is covered with fragments, mingled with agates of every description. This district extends far into the desert, petrification occurring, I believe, throughout the whole of the Valley of the Wanderings to the shores of the Red Sea. It is not difficult to break the wood; it gives a metallic sound; many specimens retain traces of bark, which crumbles off like red ochre; numerous knots are to be found; and the rings can be distinctly counted. We picked up the petrification of a fruit exactly of the shape of an almond, and of another which bore some resemblance to a date. Many of the trees I believe to have been palms, but others were certainly not.

We got up to the top of a peak covered, or rather composed of pebbles, and obtained a good view of the series of hills and valleys of which this part of the desert consists. A distant group of gazelles almost induced M— to start off with his gun after them; but we restrained him by representing the lateness of the hour. It was time, indeed, to be on the move back; so descending quicker than we had ascended, we regained the spot where we had left our donkeys, gave a piastre or two to an old Bedouin, the guardian of the place, and returned by a different route—that is to say, down the broad valley, and round the foot of Mokattam by the Imâm. An account of the frolics in which we indulged on our ride would be beneath the dignity of history. Suffice it to say, that having taken a long shot at an old vulture half-way up the mountain, we returned to our evening meal, the harmony of which was not disturbed by disputes as to how we should dispose of the results of our day's shooting. To console themselves, the sportsmen related all the wonderful feats they had ever performed, and made up their minds to go out a boar-hunting in a very few days.

'And if I don't bring back a joint to send to Mrs —,' exclaimed M—, 'I'm a Turk!'

'Allah kerim!' ('God is merciful!') cried the company, smoking their *chebouques* and *shishehs*, and puffing out volumes of smoke—which being an appropriate conclusion to this learned disquisition, I make my *salaam*.

A CHAPTER FOR LADIES.

MANUFACTURE OF THREAD.

We are told that the delicate fingers of Ariadne were busied in the manufacture of thread; and every school-boy can tell us what a service this fair lady rendered to Theseus by her industry. But the race of Ariadnes is at an end, and toiling steam-giants, with ribs of iron, and hands of brass, wood, and steel, are now concerned in this duty. For the credit of the dexterity of this lady's fingers, it is painful to have to add, that not only can the iron monsters turn out a million times more work, but can likewise supply threads finer than the most gauze-like filaments that ever left her hand. How this has been brought about, how mighty mechanisms of wonderful construction have taken the place formerly occupied by the fingers of a feeble woman, will doubtless be interesting to all to learn, especially to those who, as Cowper, with a *Popeish* affectation, says, 'ply the threaded steel,' and to whom the, to us, mysterious words, 'darning cotton,' 'wire thread,' 'Persian thread,' 'sewing cotton, Nos. 90, 100,' &c. are well-understood phrases.

At the corner of a quiet square in Manchester—if indeed any square or other place in this mechanical city deserves such a title—stands one of the most famous of the thread manufactories. Externally it is a tall but unpretending rectangular structure, presenting the usual factory features, although inferior in size to the

giant piles of building which meet the eye in all quarters of the city. Here entrance must be obtained by those who would learn the number and nature of the processes concerned in the manufacture of *sewing cotton*. But in order to convey a complete account of the thread manufacture, commencing with its leaving the 'throstle' or the 'mule' engines, it is necessary to begin by entering a cotton-mill where the preliminary operations connected with the manufacture are carried on. It is to be borne in mind, therefore, that in addition to the varieties of thread in use for the needle, there are a number of different kinds required by the manufacturers; some for making stockings, some for the manufacture of lace, some for bobbin-net, &c. And for the preparation of all these, some slight variations of the mechanical processes are necessary.

When the wonderful processes which convert the 'sliver' into 'yarn'—whether effected by the beautiful and complicated mechanism of the mule, or by the simpler contrivance of the throstle-spinning engines—are at an end, the filament produced is fit indeed for the loom, but is not sufficiently strong for other purposes. In this state it is called by the term 'yarn;' 'thread,' on the contrary, is a combination of fibres which requires great tenacity and hardness, and consists of two or more yarns closely twisted together. It appears that the earlier processes of the thread manufacture were introduced into our country from Holland by an enterprising individual resident at Paisley. We read that the total annual value of thread produced in Scotland so early as the year 1784 was L.220,000. Paisley long retained its first honours, and even now shares them with its magnificent rival, Manchester.

Beautiful as is the operation of the mule and throstle engines, the yarn they form possesses several characters in addition to those of weakness and softness, which unfit it for the needle or for the manufacturer of lace, stockings, &c. In particular, the filament is not smooth, or free from knots, and is covered with down or hairy fibres. It is therefore necessary to remove such defects; and a method perfectly successful in this object, and of the most ingenious and singular character, is now extensively adopted. This is the operation called, with the usual homeliness of the factory people, the 'gassing' process. Probably no previous conjectures would afford to the reader's mind anything like a satisfactory solution of the problem, which demands the speedy and complete removal of the fine down from the surface of the yarn. Nor would the liveliest imagination succeed, in picturing the extraordinary, and even beautiful, appearance of the room in which the process is performed. Behold a long apartment, thickly tenanted with low but noisy machines, busy with the incessantly-active engine-'tenters,' whose eyes and hands are 'here, there, and everywhere,' and apparently all at the same time; while the eye is pained by thousands of brilliant jets of gas bedotted over the upper plane of the machines; and the ear oppressed with whirring, clicking, and swift-revolving sounds. To look at the star-like points of flame which rise in thick abundance along the length and breadth of the room, one might imagine we were in the entrance-hall of some enchanted palace; but to look again at countless rollers, bobbins, and spindles for ever flying round their heated axes, and to hear the grand roll of a thousand mechanical adjustments, impelled by the distant deep-buried steam-engine, undoes the illusion, takes us out of fairy land, and places us in our true position in one of the magnificent workshops of the age of iron.

But more in detail. No great degree of mechanical knowledge is necessary to render the explanation of the gassing-engine perfectly comprehensible. It has to perform the following distinct actions:—To detect and arrest all unevenness or knottiness in the thread, to remove all down or hairiness from its surface, and to wind it up in a convenient form for future operations. The engine consists of a long frame of about four feet in height, constructed partly of iron, partly of wood.

Its mechanical arrangements are the same on both sides, so that each engine is a double one; that is, both the front and the back are supplied with the same apparatus, and effect together the same processes. Along the middle of the upper surface of the engine runs a sort of 'creel' or shelf, which is fitted with a number of little eyelet holes and wire eyes; these are intended for the reception of the bobbins of yarn as they come from the throstle-engine, or for the 'cops' of yarn from the mules. It is from off these bobbins or cops that the yarn is wound, as it passes on its way through the various portions of the machine. These bobbins or cops are placed perpendicularly, revolving on their axes as the yarn is drawn off them. In front of the machine is a long row of what are called 'driving cylinders'—that is, revolving drums, upon the upper surface or edge of which the empty reels rest on which the yarn is to be wound after the other processes are completed. These empty reels turn round simply because they rest upon the revolving surface of the drums, and in so doing wind up the yarn from the bobbin or cop, and through the other arrangements of the apparatus. This is what we might call the 'first and last' of the machine: we shall now get a clear glimpse of that which comes between. After the yarn leaves the surface of the bobbin or cop, it passes by a little peg of glass, along the smooth surface of which it glides with facility; the intention of this peg is to act as a guide to the yarn as it is swiftly drawn forwards through the apparatus. It then enters a little slit in an upright bar of steel, which is called the 'cleaner,' from the fact, that it is so small as instantly to detect the presence of a knot or other unevenness in the yarn, let it pass never so quickly. To this, however, we shall immediately return. It then passes underneath a small roller or pulley, *through the middle of a flame of gas*, over a second roller, across a horizontal glass bar in front of the machine, through a little wire eye, which guides it finally into the horizontally-revolving reel driven by the cylinders, of which we have spoken above. The gassing process is thus completed, and it is seen essentially to consist simply in sending the delicate thread through a flame of gas, by means of which the easily-combustible down on the surface of the yarn is removed in the most complete manner. If any fair reader will take a thread of the cotton in use for darning stockings, and will pass it swiftly through the flame of a wax taper, it will be found that the cotton has lost all its downy covering, and resembles in some respects ordinary sewing cotton.

The rapidity with which the yarn is drawn through the flame is the cause that it does not take fire; and the finer the yarn, the more rapid must be the revolution of the machinery, so as to effect its passage through the fire in safety. The least alteration in the speed of the machinery would cause every thread to take light and burn, so also would any temporary derangement, unless specially provided against. Such a derangement, strange to say, it is one of the chief beauties and excellencies of this apparatus to effect, while avoiding the otherwise inevitable result. To observe this, we must return to the 'cleaner' contrivance. This was described as simply a minute slit in a small upright steel bar. *The lower part of this bar is connected with some of the cleverest apparatus of a simple kind with which we are acquainted. The bar moves backwards and forwards by means of a pivot in its centre; in the upper arm is the cleaner slit; in the lower, a little notch, which hooks on and off to another lever connected with some mechanism, and placed in the horizontal position. This second horizontal lever effects the movement of several parts in the machine: it is able to lift up the winding-reel from off the driving cylinder, and so as with an animate hand stop its revolutions, and consequently the winding off of the thread. Here, then, is an instant and imminent source of danger to the thread, whose frail substance lies in the embrace of a small but intensely hot volume of flame. But mechanical wisdom foresaw the peril; and the same

movement which lifts up the reel from the cylinder strikes aside the swivel-jointed gas-pipe, and *turns away the flame*, leaving the thread stationary, yet uninjured! The mode of action is this:—Suppose a knot in the yarn to approach the cleaner slit of the upright lever; as the yarn is dragged rapidly forwards, this knot passes through the slit, but in so doing, communicates, as will be readily conceived, a slight jerk to the lever; this has the effect of disengaging its lower arm from the pin at the extremity of the horizontal lever, and the latter then immediately springs up, strikes to one side the little gas-pipe, and lifting up the winding-reel, stops the whole process as regards this individual thread, until the sharp eyes of the tenter catch the signal. She hastens forward, removes the inequality in the thread, depresses the horizontal lever until it is again hooked by the notch of the other, when all things resume their accustomed course, and the career of the yarn through the flame continues as before. Can anything more admirably automatic, and by means so uncommonly simple, be conceived? In order to insure the equal distribution of the yarn over the surface of the winding-bobbin or reel, there is an odd contrivance called a 'heart-wheel.' It is, in truth, a wheel of the exact shape of the heart; that is, *such a heart* as we see depicted on those elegancies of epistolary intercourse—the flower-crowned Valentines. The flat edge of this wheel presses against a movable frame, and as it revolves, pushes it before it, the returning motion of the frame being effected by the means of a weight and pulley. Into the edge of this frame the little wire-guides are inserted; and thus, as the frame moves to and fro, the stream of yarn is directed over the surface of the bobbin, so as to insure its perfectly equal distribution. The rate at which these bobbins revolve is from two to three thousand times a minute! In order to accommodate the rate of revolution in the machine to the nature of the yarn to be 'gassed,' cog-wheels of various numbers are fitted to it, by means of which, in a few minutes, the desired alteration may be effected. Over the jets of flame a little chimney of sheet-iron is suspended, which has the effect of preventing the disturbing influences of cross currents of air, &c. Altogether, these machines deserve an attentive study, as well for their efficiency as for their elegance, for their ingenuity as for their simplicity.

The next process is, reeling off the yarn into hanks. In the mill visited by the writer, this was carried on in a low room of great length running by the side of the factory, and a very interesting and pretty scene it presented when seen from the open doors. The reeling-engines, arranged in two parallel rows, formed the long lines of the perspective, and by their curious ever-whirling reels added a peculiar degree and kind of animation to the whole. Looking at one individually, it is found to be of a far less complicated or formidable character than the generality of the machines employed in the cotton processes. On the one side of the frame are arranged the bobbins from the gassing-engine; and on a higher level, the long horizontal frame called the reel. This reel is of very simple construction: it consists of six long horizontal pieces of wood, arranged about a central axis by six wooden arms. The objects contemplated in its construction are, to wind off from the bobbins on the other side of the frame the singed yarn into hanks or lengths, and to admit of these being readily removed when the required length is wound on them. This reel is made to revolve on its horizontal axis by a pulley and strap, which are in connection with the driving gear of the mill. In thus turning it winds off the yarn from the bobbin, and this with great rapidity, as may be conjectured from the fact, that at each revolution a yard and a-half of yarn is wound on to the surface of the reel. The distribution of the yarn on this surface is effected by a contrivance analogous to the one previously described, an eccentric wheel directing the threads to and fro by causing motion of that kind to a frame

over which the yarns pass. When the reel has performed exactly eighty revolutions, it strikes a check, which informs the attendant that 120 yards of yarn have been wound upon it. This takes place seven times, and the entire length of the hank, 840 yards, has then been wound upon the reel; that is, a little less than a half mile. The machine is now stopped by shifting the strap on to the loose pulley, and the tenter proceeds to remove the gathered hanks. In order to do this, a peculiar contrivance is had recourse to in the formation of one of the radii, or arms of the reel. It is made with a double hinge, so that it and the long piece of wood it supports can, upon occasion required, be bent in. The effect of this is to set all the hanks loose, which before were so tightly wound, as to resist any effort to slip them off; and tying each separately, she takes them into her hand between the thumb and finger, and slides them up to one end of the reel, which is now lifted up out of its bearings, and the hanks are slipped off. The hinged arm is then bent back to its former position, the ends of the yarns attached to it, and the whole set in motion again, while the collected hanks are conveyed to the Bundle Press-Room.

There are few circumstances which impress the mind of a visitor to this emporium of machinery more than the indications of ingenuity which appear in the most trifling processes. Few persons would imagine, for example, that the yarn would require the assistance of machinery in order to make it up into bundles or parcels; yet so it is, and the 'bundle press,' though a simple, is a most powerful and clever invention. In the mill visited by the writer were a number of these machines arranged in a distinct apartment. They consist of a sort of metal box, placed at the top of a frame. A kind of square piston of metal rises and falls in this box by means of a couple of iron rods or arms, connected to a wheel, which a ratchet and catch prevent from revolving back after it has been forced forwards. The sides of the box are formed of bars of metal, which leave interstices between them, through which the string for tying the yarn is put; and the top, in like manner, consists of five or six flat bars, which hook over the side bars, and thus resist the pressure of the yarn upwards when the piston is made to rise. The bundle-presser now takes a certain weight of yarn, generally from five to ten pounds, gives to each hank a twist or two, and lays them smoothly in the box, at the bottom of which he has previously laid several pieces of twine for tying it up with. He then, by means of a handle, turns round the wheel, causing the arms to push up the piston, and consequently to squeeze the bundle of yarn lying on it very tightly against the top and sides of the box. After he has exerted the requisite amount of pressure, the ratchet-and-catch contrivance prevents the wheel from returning, and the presser, at his convenience, ties up the bundle in three or four different places, cuts off the ends of the string, strikes up the catch, and lifts his bundle out of the press to make room for another. The degree of compactness and hardness communicated by this process to the otherwise soft mass is very striking. The yarn is now sent off to the lace, stocking, or thread manufacturers, in the gray condition.

After undergoing the various processes of cleaning and bleaching, which do not essentially differ from those described in a former article, and also, when necessary, of dyeing, the yarn is fit for making sewing cotton. If the reader will take a small piece of cotton from the reel, and untwist it, it will generally be found to contain three distinct yarns of various degrees of fineness, according to the 'number' marked on the little disk of glazed paper placed over the top of the reel. The lower the number, the larger the diameter of the thread. Thus one now before us, a No. 12, is the thickness of four or five hairs combined, while No. 100 is but a little thicker than a single hair; yet in both cases there is the same number of yarns. Now the machine by which sewing cotton is manufactured is one by

which this trebling process is effected, with the addition of the requisite amount of twist to combine the three into one thread. The apartment in which this process is carried on is a very busy and a particularly noisy one, and is crammed with whirling mechanisms until there is scarcely room to move. The aspect of the whole is confusing in the extreme, but an individual engine will be readily comprehended. There is, as usual, the proper form and height of framework, in the centre of the upper plane of which is the shelf for holding the bobbins, off which the separate yarns are being wound. Along the front is a row of twirling spindles, which twist and wind up the thread; and between there is a little simple apparatus, the intention of which will be best understood by the following description:—The yarns, after leaving the bobbins, are drawn downwards into a little trough, which contains a weak solution of starch in water, or sometimes water only; this is found to facilitate the twisting process, and also to communicate a peculiar gloss to the surface of the sewing cotton, or, as we shall henceforth call it, 'thread.*' They pass under a little horizontal grooved glass rod, placed under water in the trough; they then rise, pass between a pair of rollers, the lower of which is iron, the upper wood, covered with flannel, to absorb any superfluous moisture from the thread, then over a smooth horizontal wire placed in front of the machine, through a wire eye, and then, by the contrivance known as the bobbin-and-flyer, it is both twisted and wound up. The adjustments which effect these latter operations have been so fully described in a former paper, that it is merely necessary to state that they are in almost every respect the same as those of the throstle spinning-engine. To each inch of thread there is a certain amount of twist, which is not, as might have been supposed, a matter of chance, but is made the subject of rigid calculation; and by means of different-sized cog-wheels and pinions this is very readily adjusted. The contrivance of the heart-wheel is here again called into requisition, to direct the even distribution of the thread over the whirling bobbin. We are unable to state the philosophical reason, and it may perhaps be questioned whether such a reason exists, why the direction in which the three yarns are twisted into one cord or thread is just the opposite to that in which the yarns themselves were twisted when they were made. One would have supposed this was an unwise step, but the practical result is not apparently affected by it. Thread fit for the lady's needle is thus completed, and assumes its characteristic smoothness and tenacity of fibre. We may be perhaps asked, where lies the difference between the various kinds of thread used by ladies? The finer and softer kinds are made from yarn produced by the mule-engines, the harder from that formed by the throstle. Might we venture again to name the cotton for *stocking darning*?—it is prepared, we believe, without gassing, thus retaining its wooliness of aspect, and also receives but a very small amount of twist.

But the thread has yet to be transferred to those neat wooden reels which form the most conspicuous ornaments of the well-filled work-box. To see this, we must ascend to an upper storey, the workers in which are exclusively females. There is much exercise of ingenuity yet to be seen before we have quite done with sewing cotton. It is sold principally, as our fair readers best know, in the form of reels, and of little balls, sixteen or so to the ounce. How the latter were formed was long a source of the deepest perplexity to ourselves, nor could any light be thrown upon the matter by any books treating on the cotton manufactures. In five minutes the difficulty was solved. At a low bench a woman sits, by whose side is a brown paper-bag full of these same little balls. Before her is a little brass horizontal spindle, of somewhat conical form, revolving at a very rapid rate,

* In strictness, the word 'thread' applies to the filament formed out of the fibres of flax, not cotton.

and by her side is a little shelf, on which the bobbin rests from which the thread is to be wound off. Connected with this simple mechanism is a little horizontal axis, also in rapid revolution, the free end of which is cut into an endless screw. The winder now takes hold of a sort of handle, one end of which has a slit which guides the thread, while the other is cut into teeth which exactly fall into those of the screw. This handle moves up or down, so as to bring these teeth in or out of connection with the revolving endless screw; it is also so arranged as to have a free movement from side to side. Taking now the end of the thread between her fingers, she applies it to the surface of the revolving brass cone, which instantly begins to wind it up; at the same time keeping the guide-bar, or handle, in her other hand, she alternately raises or depresses it, bringing its teeth into connection with the screw; and it is thus carried by the revolutions of the screw to and fro, in so doing carrying the thread with it, and thus causing it to be wound up into a sort of spirally-formed ball. As soon as the woman considers a sufficient amount wound up, by a motion of her foot she stops the revolutions of the cone, swiftly slips off the accumulated ball of thread, cuts the end off, pushes it inside, and taking up a little disk of paper ready gummed, and labelled with the number and maker's name, she applies it over the hole at one end of the ball, and tosses it finished into her bag. Long practice enables her to form these balls with the utmost nicety to weigh just thirty grains or half a drachm each. As, however, she sometimes fails, and is paid only for perfect work, she keeps her judgment accurate by weighing an ounce of them—that is, sixteen—every now and then. One of these persons assured us that she could make *twenty pounds*, if we recollect rightly, of such balls, of thirty grains each, in a 'factory' day, which would make upwards of five thousand balls in the day! It is possible this statement may be slightly in excess, and it is therefore left open to correction.

The process of winding on reels is very similar. The reel is placed on a revolving axis of brass, which passes through its centre; the thread is conducted on to it by a precisely similar contrivance to the one above described, being thus made to assume that beautifully-regular evenness of 'lay' which must often have excited admiration and surprise. When the reel is full, its revolutions are stopped, the thread cut, and the end is slipped into a little notch made with a pocket-knife in the edge of the reel; the maker's name and the number is then pasted on, and it is complete.

Our visit to the thread-factory was now concluded. In passing through the packing-room, piles upon piles of boxes for exportation and home consumption met our view; the former lined with pitch and sawdust and prepared brown paper inside, to resist the destructive effects of the sea or of insects. On the whole, this factory, giving occupation to some hundreds of operatives, a large number of them females, affords us a good illustration of the amount of labour and capital concerned in the production of even the most trifling article in our domestic economy, when that can be prosecuted by a combination of large mechanical means.

THE PEASANTS' PRINCE.

LET us transport ourselves for a moment into the imperial palace at Vienna, and become invisible spectators of a very animated scene that took place within its walls about thirty years ago. It was in the emperor's cabinet. Francis of Austria was there, surrounded by his ministers. Every eye was fixed upon two men, who were engaged in an earnest, and almost angry discussion. From the purport of their conversation, it might easily be gathered that they were keenly opposed to each other in the great questions of the day, and that each of them contended for pre-eminence in the council and in the political guidance of Austrian affairs. One of them was already advanced in years; his courtly dress

could not impart grace to his spare and shrivelled form; and whilst engaged in an obstinate defence of absolute monarchical authority, the icy and impassable expression of his features remained unchanged. The only symptom of emotion he betrayed was a frequent and almost involuntary application of his fingers to a costly gold snuff-box, while he was expressing sternly his resolution to destroy, everywhere within the limits of Austrian dominion, those seeds of liberty which had been scattered by the arms of France upon German soil. The other, young, ardent, generous—representing by his energy, his instincts, his affections, and his principles, as well as by the frank and manly expression of his countenance, and the mingled cordiality and independence of his manners, the newly-awakened aspirations after liberty of the Austrian youth—earnestly strove to win over the Gothic court into the path of constitutional freedom. The first was the Prince de Metternich; the other was a member of the imperial family, whom we shall name by and by, and who at that time filled the office of Director-General of the Fortifications.

Metternich carried his point, and the prince immediately quitted Vienna. A few days afterwards were assembled, upon one of the Tyrolean mountains, a large body of huntsmen, who were exercising themselves with the crossbow and the carbine. Damasquined guns, leathern game-pouches, sheep decked out with foliage, flowers, and ribbons—such were the prizes prepared for the most skilful and intrepid bowmen. Many an aged *chasseur* encouraged the younger ones by reciting their own early exploits. The women and maidens of the district incited their husbands, their brothers, their lovers, by earnest smiles and hearty clapping of their hands.

A stranger advances into the arena; his bearing is graceful and noble; he wears the popular costume, and carries a crossbow and a gun. With a sure eye and a steady hand he takes his aim, and carries off most of the prizes. Guns, pouches, sheep, nosegays, ribbons—all fall to his lot. He distributes the former among the poorest of the huntsmen, and divides the gayer part of the spoil among the maidens who were present; after which he is borne along as victor by the peasants, and required to tell his name. This name is repeated by the crowd with such joyous and boisterous acclamations, that they re-echo far and wide through the lofty fastnesses of the Tyrol. It was the German prince, the proscribed rival of Metternich.

His popularity became so great, that the court grew alarmed at it, and banished him to a more distant place of exile. The prince took refuge in Upper Styria, where for many long years he pursued the same rude and primitive course of life as the mountaineers. He ate and drank with them, spake their language, sang their songs, killed the chamois at their head, listened to their complaints, and relieved their misery. He taught them to manure their fields, to double their harvests, to improve their flocks, and to sell them at the best markets. He revealed to them the value of many plants and shrubs, which hitherto they had left unnoticed in their woods and meadows. For their sakes he made himself practically acquainted with all that concerns a country life, so that he became one of the first botanists and agriculturists in Europe. His scientific discoveries were spoken of in the Academies of Vienna, Berlin, Paris, and London; while his unflinching skill as a marksman brought down the chamois at a distance of two hundred feet in the deepest gorges of the Alps. For above and beyond all other attainments, he gloried in being a huntsman; and he slept upon the snow, wrapped up in his cloak, as soundly as if he were lying beneath a coverlet of down, overhung by the damask draperies of a royal couch. His popularity became still greater in Styria than it had been in the Tyrol; and at last he was regarded as the idol of the whole people throughout Germany. Fortunately for Metternich and the emperor, he had renounced politics; for if he had not respected the throne, he might easily have overwhelmed both him and his

minister at the head of a million of peasants, who would readily have placed themselves under his command, and obeyed his orders, whatever they might have been.

An adventure of a singular kind, which occurred about this time, contributed to make this remarkable man a still fonder object of idolatry to the Styrian race. It was a bright warm morning in the month of August. At the open window of a country posthouse, situated near the base of the mountains, there sat an old man and a young girl, who were talking quietly together. The maiden was a comely daughter of the Alpine valleys, with long brown hair tinged with a golden hue; her large eyes gentle, and yet animated in their expression; her countenance beaming with health and cheerfulness; her tall full form set off by a close black spencer. Her companion was the aged master of the establishment. In other days he had been a bold and skilful horseman, but was now confined by old age and the gout to the corner of the stove, and was at this moment warming his white hairs in the sunshine, while he watched his granddaughter's busy fingers as they stitched a postilion's jacket, which she seemed in haste to finish. They were alone in the house, and there was but a single stable-boy left to take care of the horses. Every other creature belonging to the household—husband and wife, brothers, servants—all were at work some way off, cutting the ripe corn and gathering it into sheaves. Suddenly a calèche with four horses approaches, and draws up in front of the posthouse.

'The prince!' cries out the old man, who has quickly recognised the illustrious exile. 'The prince! and there is not a single postilion at home! In the name of all the saints what shall I do?'

Meanwhile the traveller, expressing his desire to proceed as quickly as possible, calls for four horses and a guide.

'The horses are there,' muttered the old man; 'but as for the guide, that is another question. That stupid lout Michael knows no more how to manage four horses than to command a regiment of hussars!'

The young girl, on seeing her grandfather's perplexity, seemed to reflect for a moment, coloured up, and then darted out of the room.

The royal huntsman becomes impatient; and the old man curses his gout and his advanced age, which fasten him to his chair, when he would fain fly in the service of so noble and beloved a prince.

At length a postilion appears, whip in hand, booted and spurred, and looking quite dapper in a new scarlet uniform. The horses are quickly harnessed; the postilion leaps into his saddle, and instantly sets off at a full gallop.

The prince is pleased at the rapid pace of the horses and the skill of the young postilion. At the end of the stage he desires the youth to come and speak to him—is struck by his gentle manners, his charming countenance, his sweet voice—observes him blushing—and recognises in him a woman!

'Who art thou, then?' inquired he with a surprise mingled with deep interest.

'I am the daughter of the master of the posthouse,' replied the young girl, quite disconcerted at being thus discovered. 'Your royal highness could not wait; so,' continued she, her colour heightening as she spoke—'so I dressed myself like a postboy, and have done my best.'

'Thou hast done very well indeed, my child,' rejoined the prince in that tone of kindly benevolence which endeared him so much to the people—'thou hast done very well; and I thank thee for thy gracious mode of serving me. Thou must accept this,' added he, while holding out a small purse with some gold pieces in it, 'as a proof of my gratitude.'

The maiden looked irresolute for a moment; then opening the purse, she withdrew a small gold coin, and kissing it fervently, placed the remainder in the prince's hand, saying, 'This piece shall always be precious to me; but your royal highness must not be displeased at

my refusing to take any more. I have served you with the duteous love which every Styrian woman bears to you, but not for the sake of a reward.'

The prince looked surprised at this courageous and noble-minded young girl, and each moment her fine intelligent countenance grew more attractive in his eyes. He detained her some minutes in conversation; and just as she was about to lead away the horses, he said to her with an air of gallantry, 'Come, my child, it would be a pity for us to part so soon. I will return back with you; but some one else shall guide the horses, and you shall bear me company in my carriage.'

The young girl blushed far deeper than before; but this time it was with an air of offended dignity, and she replied in a resolute tone, 'Each one in his own place, may it please your highness; thus it is that kings and shepherdesses preserve their honour.'

On hearing these words, the passing fancy of the traveller changed into a passion full of respect and esteem.

'Your fair fame is as dear to me as my own,' said he; 'and it depends on you alone whether they shall for ever be united in one. You made yourself a man to serve me, and I will make you my wife to love you. Say, shall it not be so?'

The astonishment of the young girl may readily be conceived; but she did not appear disconcerted, and after a moment's consideration, replied with perfect simplicity, 'If you can obtain the emperor's consent and my father's, you shall have mine also, sir.'

An hour afterwards, the prince and his postilion entered the wayside inn, and he formally demanded of the postmaster his daughter's hand. There was very little difficulty in obtaining his consent. With the emperor it was quite another matter.

It was affirmed at the court of Vienna that the august chasseur was mad, and that he ought to be treated as such. His highway romance became the theme of mockery and ridicule; but he took care to prove that he was perfectly in his senses. And lest he should prove the strength and the power of his will also, the emperor of Austria most reluctantly subscribed to the union of his race with that of a Styrian peasant.

And so the marriage was celebrated, to the great scandal of the court, and to the unbounded joy of the people of the mountains. From that day forward the prince was worshipped by the nation, and scoffed at by the imperial family.

A celebrated painter having taken his likeness in the costume of a Styrian huntsman, and had it engraved, the sale of these portraits was prohibited under rigorous penalties; and yet every honest mountaineer contrived to have a copy of it, which was invariably placed between his gun and his crossbow, as being two of his choicest household treasures. Even in the public places of Vienna, and on the very boards of the theatre, the dress and the habits of the 'royal adventurer' were represented for the amusement of the courtiers.

All this went on until the revolutionary outburst of the last year. Most fearful was the upheaving of the political earthquake in Austria. The old empire tottered to its base; Metternich fell and fled; the emperor quitted Vienna; Italy revolted; the provinces detached themselves from the capital; Germany seemed threatened with a total dismemberment. It was then that a federal Diet formed itself at Frankfurt, with the view of uniting Germany under one directing central government. This Diet created a vicar-general of the empire, to whom it confided the supreme and central power in the name of the confederation; and it chose for this sovereign office the most popular prince of Germany—he who had been proscribed by Metternich and the emperor; the huntsman of the Tyrolean and Styrian mountains; the husband of the postmaster's daughter; in a word, the Archduke John; he who, at the age of twenty-seven, had been the conqueror of Napoleon and the deliverer of Tyrol; who, as a German, at the grand Cologne festival in 1842, had given this memorable

toast, 'No more Prussia! no more Austria! but a strong and united Germany!' The Archduke John did not shrink from the arduous office assigned to him. He quitted his country dwelling, and laid aside his hunter's garb, his crossbow, and his gun. He raised the tricoloured standard of Germanic unity, and entered Frankfort in triumph, with his beloved companion, the daughter of the mountains, at his side—she who had known so well how to preserve the true dignity of a woman in her humble life, and who consequently was not dazzled by the almost imperial splendour of her present position. It lies not within our scope to discuss the political wisdom of the mission with which the archduke was charged by his countrymen: ours is a humbler task—that of portraying the romance of domestic life in one of the proudest and most ancient families in Europe. This being accomplished, we have done.

THE PRAYING INSECTS.

'IMAGINATION itself,' says Dr Shaw, 'can scarcely conceive shapes more strange than those exhibited by some particular species of mantis,' or praying insects; and this peculiarity of form has procured them a name and reputation which is, we fear, sadly belied by their ferocious and pugnacious habits. The anterior feet, which are very large, and furnished with a claw, are frequently extended in a manner which induced the ancients to believe that the insect possessed the power of divining or foreshowing events: hence, according to some, arose the generic name of mantis, which signifies diviner; but Griffith, in his supplementary additions to Cuvier's 'Animal Kingdom,' derives it from a Greek word, which is employed in one of the Idylls of Theocritus to 'designate a thin young girl, with slender elongated arms:' certainly not a flattering comparison for the maiden of whom the poet sang; for the mantis (properly so called) are a most unsightly race, with long lean bodies, ferocious countenances, and shapeless wiry limbs.

They are seldom seen beneath a northern sky, but delight to dwell in the regions of the sun; the most northern latitude in which they abound is, we believe, in the bright plains of Languedoc and the fair Provence, where the *M. religiosa* obtains the names of *devin*, *prega-dieu*, *prêche-dieu*, or *prie-dieu*, from the power which they possess of raising the long corslet in such a way as to form a right angle with the abdomen, and of folding the arms, if we may so call them, across the breast, as if in the act of prayer. Every land appears to regard them with the same feelings: the Turk deems that they are under the especial protection of Allah; the Hottentot, though he does not, as has been asserted, worship them, yet pays them the highest veneration, draws augurs of good from their flight, and holds the person on whom they may chance to alight as pre-eminent in sanctity, and as the avowed favourite of Heaven; and the Hindoo displays the same reverential consideration of their movements and flights. Whether the inhabitants of China also deem them sacred we know not, but certain it is that these 'Celestials' so far descend to earthly things as to amuse themselves with the spectacle of mantis-fights, for which purpose they are kept separately and carefully in small bamboo cages, and retailed by the Chinese boys, who regularly deal in them as a marketable commodity. When put together, these insects, with the most extraordinary gestures, commence a battle, in which the weaker soon falls a victim to his fellow, who, after a few preliminary movements of exultation, devours the body of his fallen foe. Roësel, who paid great attention to this singular tribe, observes that 'their manœuvres very much resemble those of hussars fighting with sabres; and sometimes one cleaves the other through at a single stroke, and severs the head from the body.' He also affirms that he has frequently seen the young mantis, when 'newly disclosed,

attack each other with fury, raising their corslet in the air, and holding their two anterior feet joined and ready for combat, as if already longing to

"Meet in mortal shock."

We understand that one of the amusements with which our countrymen in British India endeavour to wile away the long hours of heat and languor, is that of placing an unhappy mantis on a table, and fighting it with a straw, for the purpose of witnessing the caricatured boxing attitudes into which it throws itself—an amusement which probably affords more mirth to the 'man of straw' than to the poor mantis whom he is irritating.

With regard to the cannibal propensities and murderous disposition towards its own species exhibited by the mantis, we imagine that such are only seen when in a state of captivity; and moreover, that similar instances of misplaced revenge for injuries inflicted by man, may be met with in various animals which are, when at liberty, perfectly peaceful and kindly. We remember on one occasion seeing a trap in which four mice had been caught alive in one night, but when morning dawned, the three weakest lay dead, and partly devoured; whilst the wretched survivor, who could not have been impelled by hunger, alternately endeavoured to effect his escape, and attacked, as if in desperation, the lifeless bodies of his companions.

When watching for its prey, which principally consists of various kinds of flies, the mantis assumes its sitting posture, and patiently waits, with folded arms, as before described, until the unconscious fly comes within reach, when, with sudden spring, it seizes the long-wished-for morsel, and conveys it to its mouth, using the pincer-like claw in the manner of a hand. But should an ant approach, the mantis, which, like all other quarrelsome natures, is a sad coward, flies away in great haste, and with evident signs of consternation.

The genus mantis is subdivided into four distinct species—namely, *mantis*, *spectrum*, *phasma*, and *phyllium*. Of these the true mantis appears to be the most blood-thirsty, yet at the same time the most venerated for its supposed sanctity. The spectrum, as well as the phyllia, live on vegetable substances: the inhabitants of the Seychelles islands rear the former as an object of commercial speculation, selling them to collectors of natural curiosities.

The phyllia are sometimes appropriately called 'walking leaves;' for not only do the wings resemble leaves in colour and form, but also in apparent texture and disposition of the nervures; whilst the legs are winged, or finned, as it were, with parts which may be perfectly imitated by tearing away the tissue of a laurel leaf with the fingers in such a manner as to leave irregular portions attached to the larger veins. It is said to be extremely difficult for the most practised eye to detect these phyllia when at rest on the bough of a laurel or orange.

The phasma, again, closely resembles the stalk or branch of a tree. We speak from experience, well remembering the laugh which turned against us when, after gazing with doubtful glance at a phyllia, in the first collection we ever saw, which we could scarcely believe was not concocted of laurel leaves, as a practical joke at our expense, we pointed out, what in our ignorance we thought was a bit of dead stick, which had fallen accidentally into the case, but which proved to be a much-valued specimen of *P. gigas*, an East Indian insect eight inches in length.

The dry-leaf mantis (*Phyllum siccafolia*) resembles, as its name imports, a withered leaf, and the delusion is increased by its habits; for hours it will remain motionless on the trees, and then springing up suddenly, indulge in evolutions similar to those of a leaf at the mercy of the winds. This species is common in South America, where the natives believe that it is really produced from, and attached to, the tree at first, and that, when arrived at maturity, it loosens itself and flies away;

a conceit which certainly rests on a more natural basis than the fanciful idea of the barnacle goose, with which Britons formerly delighted to amuse their imaginations. The eggs of the mantis tribe are deposited on the stalks of plants and shrubs, the clusters, which might be mistaken for fruit or some vegetable excrescence, being covered by the mother with a glutinous or gelatinous matter, which dries into a flexible parchment.

THE TRIUMPHS OF OUR LANGUAGE.

BY THE REV. JAMES GILBORNE LYONS, LL.D.

[We have received this fine-spirited poem from Philadelphia, and beg to return our acknowledgments to the gifted author.]

Now gather all our Saxon bards,
Let harps and hearts be strung,
To celebrate the triumphs of
Our own good Saxon tongue;
For stronger far than hosts that march
With battle-flags unfurled,
It goes, with FREEDOM, THOUGHT, and TRUTH,
To rouse and rule the world.

Stout Albion learns its household lays
On every surf-worn shore,
And Scotland hears it echoing far
As Orkney's breakers roar—
From Jura's crags and Mona's hills
It floats on every gale,
And warms with eloquence and song
The homes of Innisfail.

On many a wide and swarming deck
It scales the rough wave's crest,
Seeking its peerless heritage—
The fresh and fruitful West:
It climbs New England's rocky steep,
As victor mounts a throne;
Niagara knows and greets the voice
Still mightier than its own.

It spreads where winter piles deep snows
On bleak Canadian plains,
And where, on Essequibo's banks,
Eternal summer reigns:
It glads Acadia's misty coasts,
Jamaica's glowing isle,
And bides where, gay with early flowers,
Green Texan prairies smile.

It lives by clear Itasca's lake,
Missouri's turbid stream,
Where cedars rise on wild Ozark,
And Kansas' waters gleam:
It tracks the loud swift Oregon
Through sunset valleys rolled,
And soars where Californian brooks
Wash down their sands of gold.

It sounds in Borneo's camphor groves,
On seas of fierce Malay,
In fields that curb old Ganges' flood,
And towers of proud Bombay:
It wakes up Aden's flashing eyes,
Dusk brows, and swarthy limbs—
The dark Liberian soothes her child
With English cradle hymns.

Tasmania's maids are wooed and won
In gentle Saxon speech;
Australian boys read Crusoe's life
By Sydney's sheltered beach:
It dwells where Afric's southmost capes
Meet oceans broad and blue,
And Nieuveuld's rugged mountains gird
The wide and waste Karroo.

It kindles realms so far apart,
That, while its praise you sing,
These may be clad with autumn's fruits,
And those with flowers of spring:
It quickens lands whose meteor-lights
Flame in an arctic sky,
And lands for which the Southern Cross
Hangs its orb'd fires on high.

It goes with all that prophets told,
And righteous kings desired,
With all that great apostles taught,
And glorious Greeks admired;
With Shakspeare's deep and wondrous verse,
And Milton's loftier mind,
With Alfred's laws, and Newton's lore,
To cheer and bless mankind.

Mark, as it spreads, how deserts bloom,
And error flees away,
As vanishes the mist of night
Before the star of day!
But grand as are the victories
Whose monuments we see,
These are but as the dawn which speaks
Of noontide yet to be.

Take heed, then, heirs of Saxon fame,
Take heed, nor once disgrace
With deadly pen or spoiling sword
Our noble tongue and race.
Go forth prepared in every clime
To love and help each other,
And judge that they who counsel strife
Would bid you smite—a brother.

Go forth, and jointly speed the time,
By good men prayed for long,
When Christian states, grown just and wise,
Will scorn revenge and wrong;
When earth's oppressed and savage tribes
Shall cease to pine or roam,
All taught to prize these English words—
FAITH, FREEDOM, HEAVEN, and HOME.

WEIGHING MACHINERY AT THE MINT.

A very ingenious contrivance for weighing coins delights us most, not having seen it adopted at any other mint. A native of Vienna claims the invention; and though it has been in use for some years, it has only just been sufficiently adjusted to be effectually used. It consists of some twelve small scales, suspended on a light beam, and parallel to each other. The proper weights for the coins are placed in the outer scales, while the inner ones face a slide, with three horizontal slits before each scale. As the pieces of coin are slid into the scales, the man turns a wheel, which raises the whole set of balances up to a certain height, when the scales are jerked against the slits: if the coins are of the proper weight, they are pitched through the centre slit; if too heavy, they are shot into the lower; and if too light, into the upper. The scales are now empty, and on the descent, are again replenished from the slides: thus in a few seconds a dozen coins are weighed and sorted without one having been touched. It is a very ingenious contrivance, the man's labour consisting merely in turning the wheel to elevate the scales, and occasionally to replenish with coin the tubes which feed the scales as they become cleared.—*Pictures from the North.*

A DINNER-SHOOTING ARTIST.

That artists are sometimes grievously hard up in Rome there can be little doubt. I happened one cold morning to call upon N—, whose absence from his usual seat at the Lepri had been remarked by many of us. Instead of finding him, as I had anticipated, unusually busy with his chisel, he was engaged in shooting his dinner at the open window of the garret, which commanded an extensive range of leads, tiles, and gutters. His sport, which he pursued in solemn silence, was the common sparrow, and his weapon a machine much in use among lawyers' clerks when the principal has turned his back, known by the name of a 'puff and dart,' from which any one with a good pair of lungs can expel pins with great force. Having knocked over nearly a dozen birds, N— walked out of the window to collect them, and then plucked and spitted them, enjoying his repast with a thankful relish unknown to those who get a good dinner every day.—*Bevan's Sand and Canvas.*

ACORNS IN SPAIN.

The acorns are still called *bellota*, the Arabic *bolot*—*bolot* being the Scriptural term for the tree and the gland which, with water, formed the original diet of the aboriginal Iberian, as well as of his pig: when dry, the acorns were ground, say the classical authors, into bread; and when fresh, they were served up as the second course. And in our time, ladies of high rank at Madrid constantly ate them at the Opera and elsewhere: they were the presents sent by Sancho Panza's wife to the duchess, and formed the text on which Don Quixote preached so eloquently to the goatherds on the joys and innocence of the Golden Age and pastoral happiness, in which they constituted the foundation of the kitchen.—*Ford's Gatherings in Spain.*

THE ART OF ROMANTIC FICTION.

THE absence of criticism, to which we have referred, is perhaps more obvious in Fiction than in any other department of our literature.* Everybody writes fiction: 'it is as easy as lying.' When the boy and girl have left school, and look around for the first time upon society, they sit down at once to dash into three volumes of an account of its life and manners, tracing out the springs of action, and anatomising the sentiments and passions. They know, if they know anything at all, that their theme is philosophy in action, and their Mr A's and Lady B's the algebra of morals. But, after all, it is only *fiction* they aspire to deal with; and they have no mistrust of the powers that have been exercised, from the age of dolls up to that of sweethearts, in peopling the small area in which they lived, moved, and had their being, with shadows and mockeries!

If the authors do not hesitate, why should the reviewers? If it is so easy to write fiction, surely it is still easier to estimate it when written; and accordingly the journalist, who would look with respectful suspicion upon a work in philosophy, declares, without a moment's hesitation, his opinion of a novel. The opinions, however, with which the public are thus favoured, are rarely consonant; and the reason is, that they usually spring from individual tastes or fancies, irrespective of any general principle of criticism; just as Lamb might have pronounced Scott to be a confused writer, because he himself was bewildered, rather than interested, by his narratives. In a recent number of the 'Edinburgh Review,' there is an attempt to generalise on the subject, introduced in an essay on the 'Iliad' and 'Odyssey,' to which are appended, oddly enough, some specimens of a romance of the day. The attempt, however, is partial; and to us it conveys the idea that the writer had not sufficiently elaborated his theory, to have any very distinct notions himself on what he would communicate to his readers. He divides works of fiction 'as to their peculiar merits'—that is to say, as to their construction, apart from considerations of subject and style of composition—into those whose principal aim is excellence in plot, in character, or in scenery. But no novelist, practically speaking, aims at anything else than to tell his story well and effectively, however his peculiar genius may lead him to excel in one of the three assumed conditions of success, and fail in the other two. As to that which relates to scenery, the critic includes in it not only the playhouse properties of picture, dresses, and other physical appliances, but the fancies and reflections that give its moral colouring to the piece. This involves a manifest error;

for these two kinds of colouring are not only distinct in themselves, but in their higher qualities are almost never found in union. It would in our opinion, therefore, answer better the purpose of criticism to consider the conditions of success as *fourfold*; namely, plot, character, moral colouring, and material colouring.

We remember having been much amused by the ingenious theory touching the production of what may be called *optical music*, by presenting certain colours to the eye in artistical sequence, so as to have a similar effect to that of the notes of the piano upon the ear. This silent music was to be played by the fingers, like an instrument of sound; and the beholder was expected to be softened or stirred by the mystic harmonies of colour, in the same way, and to the same degree, as if he was listening to the piece of a master. Fanciful as the notion may seem, it is not without its foundation in truth; and perhaps, when we are more highly educated in æsthetics, and our perceptions have become in consequence more acute and refined, men may revert to the subject as at least a possible means of extending their enjoyments. A similar harmony is unconsciously extracted from an extended view of natural objects—spread out before us, for instance, in a wide and varied landscape. The picture does not come upon us in one impression. We separate its parts; we bring together its affinities; we arrange its contrasts and sympathies; and the pleasure we receive is in proportion to the refinement of our taste, and the unconscious skill we exercise in its gratification. The work of an artist is of the same kind, but more determinate in its object. He does not collect, but select the parts of the landscape. He fixes perhaps upon some special feature; but even then he is not a mere imitator of the physical realities before him. The position of a tree, the inclination of a branch, the introduction of a figure, the form of the clouds, the calm still blue of the heavens—all these, and a thousand other similar circumstances as trivial in appearance to the uninspired or uneducated eye, may give its character to the piece. The artist, in fact, does by rule what the idle spectator does by instinct. Were this not the case, he would create—or, to speak more correctly, construct—only for his own gratification; for he would be without his world of admirers to cheer him on by their applause, and advance in knowledge and refinement, and in virtue and happiness, by his aid.

A strict analogy may be traced between the artist in forms and colours and the writer of fiction. Human life is the wide and varied landscape from which the novelist selects his incidents, characters, and hues; and on the taste and skill with which these are combined, so as to form *one picture*, depends his success. He is no more to follow 'nature,' as the phrase is—by which is meant mere physical reality—than the painter. He

* See 'What is Criticism?' in last number.

must select, adjust, interweave. He must be possessed with a consciousness that the whole of the landscape before him—in other words, the whole of human life—is at his disposal; that he is not a surveyor, or land-measurer, or statistician; but that, however circumscribed may be the scene he has chosen, it is his business to take care that there is a sympathy, a harmony, a oneness in its parts, which will form a perfect *enchainement* of interest in the whole.

In writing biography, or in relating in conversation the history of one of our acquaintances, we are not permitted to sacrifice the true for the sake of artistic effect, any more than a surveyor is permitted to transform or transpose the parts of an architectural drawing for the sake of the picturesque. We relate the circumstances just as they occurred; although adorning them, according to our own taste, with the elegancies of language, and flinging upon them the incidental colouring of sentiment and description. Fiction, however, is widely different from biography. There we have not only the colours, but the incidents and their sequence, at our own disposal, and it is our business to select and arrange them according to the rules of art. This seems a trite observation; but we can undertake to say, from a somewhat wide experience, that it is very rarely applied. The sequence of incidents, or, in other words, Plot, is misunderstood even by the critic whom we have alluded to above. He declares the plot of 'Quentin Durward,' for instance, to be absurd, when it is in reality a perfect masterpiece of the art. We of course do not talk of the incidents themselves, but of their sequence and connection. We do not praise the object in view—which is simply that of getting a commonplace adventurer married to a commonplace heiress—but the skill exercised in bringing even the most trivial circumstances, as well as the great events of history, to bear upon that object. Thus, in estimating the science which has constructed a bridge, we do not take the purpose of the work into account; for that belongs to an inquiry of a totally different nature.

An artistically-constructed plot resembles the arch of a bridge in this: that all its parts are *necessary*. We may indulge our taste or fancy as much as we please in extrinsic ornament; but the real works of the construction, whether this be literary or scientific, must form an indispensable part of the whole. The best test to which to put a fictitious narrative, is to deprive it of a leading incident; and if it stands under the deprivation, its construction is not artistic, and it must be condemned in point of plot. An illustration of this fact may be found in the works of nature herself. An imperfect animal (such as a centipede) may have any number of limbs the trunk will carry, and in many tribes the loss of a limb is attended with no inconvenience, and, indeed, with no permanent derangement even of symmetry, since it grows again. But as we ascend in the scale of being, the Great Architect is not so lavish. The limbs become fewer as they become more valuable; and in the most perfect of all developments they are in exact proportion to the requirements and necessities of the species. The human body resembles a perfect fiction, where all the parts are necessary, congruous, and symmetrical.

It is curious that Scott himself, the greatest master of plot in our language, was not aware of its value in fiction.* But the gifted novelist wanted a philosophical

and inquiring mind, just as the world-renowned author was destitute of a sense of the intellectual grandeur of literature. Among the novels he commends most highly as *novels* is 'Marriage,' a work which, though abounding in character, fulfils no other condition of the fictitious narrative. In 'Marriage,' the heroine is brought up in the Highlands of Scotland, having been deserted by her fashionable mother. In due time she repairs to London to seek this parent, and is met with coldness or dislike. She falls in love with a gentleman, whose mother desires their union; but the fear that her suitor is influenced only by sentiments of filial obedience, makes her hesitate; till at length, being accidentally convinced of his affection, the marriage takes place, and the story ends. This is the plot of 'Marriage.' Everything else in the book is extraneous. The sketches of character throughout, however, are striking, and sometimes excellent; and the reader, led on from one to another, fancies he is interested in the narrative, till on looking back at the end he sees only some unconnected groups or individuals dotting the distance in his memory.

If Character were the most important condition of success, we should have to place various contemporaneous names above that of Scott. Scott never reached the philosophical depth either of Godwin or Bulwer Lytton (two completely opposite writers); and there are several of the characters of Dickens and Thackeray which would lose little by comparison with those of the Waverley Novels. Scott, in fact, may be said to stand higher as a painter of manners than of character; but it is the *completeness* of his fictions as works of art—the indestructible web, so to speak, of their story—which, notwithstanding some deficiencies in character, and at least moral colouring, place him at the head of the artists of this century, and will make the world recur to him again and again when successive schools, after flourishing for a while, sink and disappear. This distinction between character and manners was felt before the time of Scott by Johnson; although in the illustration he gives, the conversational oracle appears to confound elaboration with profundity, preferring the surface-carving of Richardson to the artistical completeness of Fielding. 'There was as great a difference between them,' says he, 'as between a man who knew how a watch was made, and a man who could tell the hour by looking on the dial-plate!' But Johnson felt the philosophical fact, though misled in its application by his customary prejudice, and he shows why manners will always have the advantage in popularity over character; characters of manners being 'understood by a more superficial observer than characters of nature, where a man must dive into the recesses of the human heart.'

We are not sure, indeed, that character, in the highest sense of the term, belongs to prose fictitious narrative at all. Manners are the material indication and outward garb of character, and have their natural place in a story of the events of human life; but the depths of the mind can only be explored and revealed in a metaphysical essay or a poem. 'Macbeth'—'Othello'—'Lear'—these are narratives, and in a certain sense monologues, of character. In them all things are subordinate to a single end. The design is not so much to relate a story of human life, as to dive into the arcana of the human mind. The persons of the drama are brought in for the purpose of ministering to one personage; and the action is described, not as interesting in itself, but merely as the vehicle of an idea which could not otherwise be revealed to the senses. In prose fiction, character—always speaking of it in the highest sense of the term—is never duly appreciated, otherwise 'Mandeville,' for instance, would not now lie buried in the dust of a score of years. The only reason that need be given is, that it can neither in itself fulfil the conditions of romance, nor consent to the common rules of co-operation.

After plot and character comes Moral Colouring, in which the author sometimes appears as an interpreter

* It must be admitted that the fourth volume of the 'Heart of Mid-Lothian' has hardly any connection with the plot: but it appears to have been written merely to fill up to the length of the former series, and for the sake of pecuniary gain.

of exoteric symbols, and sometimes traverses the stage like the chorus of a Greek tragedy, the popular expression of intelligence and sympathy. This is a more important part of the fictitious narrative than it would at first sight appear; and the reason is, that its mode of operation is not always obvious. It would be easy to dispute a direct proposition, or guard against a false corollary; but the moral colouring is sometimes so closely interwoven in the action described, that its source is imperceptible. The slightest possible exaggeration, for instance, will not unfrequently make a virtuous action ridiculous. The colouring is thus given in the *mode* of representing circumstances, as well as in avowed sentiments and comments, and may be described as being reflected through the prism of the author's individuality. This affords a very tempting outlet for self-esteem. Young writers, when young persons, always begin with novels and moral essays—the very things of all others which they cannot by possibility know anything about; and when they betake themselves to fiction, they can never refrain from favouring the world with choice bits of their idiosyncrasy. The time has been, indeed, when this accessory to fiction was esteemed capable of sufficing for all, and when sentimental novels were supposed to require little or no aid from plot, character, or material colouring. In Scott this rule is reversed. His sentiment is neither profound nor always even correct. He does not reason, but describe. His field is action, not thought. He knew intuitively that the exterior life was the province of romance, and that when romance went deeper, it strayed into the bounds of poetry. But the line must not be harshly drawn, for there will always be a debatable ground between the two regions of art: and here was the weak point of Scott in his literary character, for his poems themselves are merely romances in rhyme.

The Material Colouring is to fiction what the scenery, dresses, and decorations are to the drama; and the greatest living master in this department of the art—far superior even to Scott (though far inferior to Defoe)—is the American novelist Cooper. Knowing nothing of the requirements of plot, and very little of manners; with hardly the faintest notion of ethnography, or the depiction of mental character, and destitute of the depth of mind required in moral colouring, it is wonderful how much he does, even in narrative, by the mere aid of scenery. The desert and the ocean seem in his hands endowed with life; their phenomena are the material agents of the story; and the human beings who wander over their bosom seem hardly necessary as a point of human interest. The vessel at sea, or the wagon in the prairie, is the true personage of the piece; and even if we were to divest these of every connection with social life, they would still rivet our sympathy. Though so great, however, in the distinct branch of the art now referred to, Cooper is so poor even in character of manners, that the Americans themselves, if we may judge from a satirical poem recently published, begin to turn his pretensions as to this essential condition of romantic fiction into ridicule.

Material colouring, however, has been elevated in point of art by younger writers, although not rendered more subservient to the purposes of fictitious narrative. The pantheistic tendency of poetry has encroached upon the region of romance; and the sights and sounds of nature are now endowed with a mystical meaning, which, however adapted for the inner life, must diminish the effect of those external incidents that are the staple of fiction. Dickens is a master in this way; but the more extravagant he is in the accessory, the less successful he is in the art. His reputation as a novelist will, in our opinion, rest ultimately upon 'Oliver Twist' and 'Nicholas Nickleby;' the overcharge in the kind of colouring alluded to, so obvious in his more recent productions (not to mention their comparative inferiority in plot and manners), injuring them as works of art.

We have now glanced rapidly at the principal condi-

tions of romantic fiction; and if we only remember that the main subject of this department of art is a *narration of events*, we shall be at no loss to conclude that plot is the most important of all. It is no excuse for a story inartistically constructed, that its incidents are *true*. If they are incapable of standing alone in their sequence, why present them in the form of a fiction? This cannot arise from our respect for the true, but from our confounding the true with the natural. The truth of romance, however, is the truth of poetry, the truth of nature, and not the truth of individual facts. Neither sketches of character and manners, nor moral and material colouring, however good in themselves, will make a good romance. A painter of figures might as well depend upon his flesh-tints, drapery, and back-ground, without a knowledge of anatomy. Plot is the bones, sinews, muscles of the piece, and the other conditions give beauty and finish to the whole. We cannot give up too much to plot; but the rest must be kept in due subordination, and toned down when necessary, so as to contribute to the *general effect*.

Let us not be told that fictions *succeed* when they are mere sketches of character—mere sentimental rhapsodies—mere descriptions of scenery; for we are not pointing out the way to popularity, but to improvement in art; and not depreciating the merit of ethnologists and colourists as such, but denying that they are, in the large sense of the word, artists. The fetters we would impose upon the novelist are not restrictions upon genius any more than the rules of the drama, of epic poetry, of pictorial art, or of the other provinces of taste. We would only suggest that there can be no steady improvement in any of these departments without theoretical knowledge, and that it is the duty of criticism, as the handmaid of art, to proffer her assistance in the misty aspirations, the convulsive throes, and instinctive graspings of genius. The present would seem to be a favourable time. The Germans, in their search after the mystical, have stumbled upon the natural, and borne the first torch of discovery into that magnificent mine, rich in all the more elegant and gem-like treasures of intellect. Systematised by them almost into a science, æsthetics, or the philosophy of art, is now extending throughout the whole world of taste; and criticism, though not æsthetics—though nothing so high and holy—is based upon its laws, and bows reverently to its authority. Let criticism, then, prevent the waste of mind that has so long been going on. Let romantic fiction, under its tutelage, share in that progress which has now become an almost universal law; and let a department in literature, only second to epic poetry, assume a position of corresponding dignity.

L. R.

THE LADY OF LOUDUN.

BY DUDLEY COSTELLO.

ABOUT the end of October, some six or seven years ago, I was returning homeward from the south of France, after passing a part of the autumn in the Pyrenees. My only companion was a puppy of that famous breed of Pyrenean watchdogs, in whom the wolf finds a deadly antagonist, and the bear a formidable foe. But at that time there was nothing very fierce in the appearance of *Gave*—such was the name it bore, in memory of the mountain torrent beside which it was born—for it was only three weeks old, and travelled very comfortably in one of those round baskets which the Béarnaise peasants use to carry their eggs in to the market of Pau. As the basket was rather cumbrous, I found, after the experience of the first four-and-twenty hours, that it would be as well for my own comfort if I placed *Gave* under the care of the *conducteur*, and to that functionary I accordingly consigned her, leaving myself nothing to look after but my own comfort. The route I chose from Bordeaux was by the steamer down the Gironde as far

as Mortagne, where I took the diligence to Saintes, and from thence by way of Niort to Poitiers. Nothing more remarkable occurred before I reached the antiquated capital of Poitou than a furious cold, which I caught *en route* from keeping the window open all night on my side, in consequence of the disagreeable proximity of a young priest who got into the diligence at Lusignan, and who certainly could have had nothing in his person to charm the fairy Melusine, the tutelar genius of that romantic spot, unless her olfactory nerves were French overproof. At Poitiers a grand fair was being held, and it was with some difficulty I could find a bedroom to spare at the Hôtel de France where we stopped; but as I wanted one more on account of my four-footed companion than on my own, I succeeded at last in getting the necessary accommodation, locked up Gave for the day, and devoted the whole of the time I was to remain at Poitiers in visiting the countless relics of antiquity for which the old city is so remarkable. In the evening I resumed my journey towards Saumur on the Loire, and a little after midnight arrived at Loudun.

The occasions are few on which I have been more impressed with a feeling of solemn awe than during the half hour I stayed at Loudun; for so long did it take to obtain the relay that was to convey us the next stage, and to receive the only passenger, who certainly did not appear to be in any extraordinary hurry. In the meantime, such travellers as had started from Poitiers with me had been set down at different places on the road; and when the tired horses were taken out of the heavy, lumbering diligence, and I was left alone in the wide market-place, with the bright moonlight casting the towers of the old church of St Pierre into deep shadow, and throwing a ghastly light on the tall houses opposite, it seemed as if no effort of memory were necessary to bring vividly before me the scene of cruelty which, two hundred years before, had been perpetrated there, when Urbain Grandier, accused and convicted of witchcraft, but in reality the victim of priestly tyranny, was burned in the square on which I was now gazing. Could we recall, or were we acquainted with the events which have happened wherever, in the course of our wanderings, we may chance to have paused, no doubt the recollections might be as melancholy as they proved to be on this occasion; for where is the spot of earth unprofaned by crime more or less recent? But even those places with which we are most familiar depend in a great degree upon the aspect under which they are presented to us for the impression which they produce. In the broad light of day other influences are at work: we argue more coolly, we take things more as a matter of course than at any other time; but when, unexpectedly, and in the dead hour of night, the memory of deeds of blood forces itself upon us, it meets with a very different reception. It was for this reason, I suppose, that the fate of Urbain Grandier had so much hold upon my imagination at that moment.

The uncomfortable feeling which I have described was gaining ground very rapidly, when the clattering sound of horses' hoofs and the postilion's rude voice of encouragement luckily dispelled them. Our cattle were put to with the usual noise which accompanies the yoking of a team, or anything else, in France; but before we started for Fontevault, the steps of the diligence were let down, and the door was thrown open by the conducteur, to admit the person who was to occupy the interior with me for the rest of the night. The night appears to be considered the most propitious of all seasons for travelling in France, and indeed gene-

rally on the continent; and whether the distances be long or short, the public conveyances always set out at the most inconvenient hours. Perhaps locomotion is so much less natural to them than to ourselves, that they try to get over it in their sleep. Their own excuse is, that it saves time; and so it does, if you are fit for anything next day, after travelling all night in a diligence. I did not, however, question the propriety of the arrangement at Loudun when I found that my companion was a female, and as far as I could judge by the glimpse I got of her figure, young and well formed. The conducteur, with customary politeness, assisted her into the diligence, and then handed to her something covered over with a handkerchief, which had greatly the appearance of a bird-cage; nor could I have much doubt of the fact when I heard the lady utter a chirping sound, and desire Coco 'rester bien tranquille.'

'A canary,' thought I; 'it's a pity that my pet is not inside too.' But I consoled myself with the reflection that she was most probably fast asleep in her basket in the sheltered cabriolet overhead.

The terrific rattle of the wheels of the diligence through the deserted streets of Loudun totally precluded all attempts at conversation, even had either of us been so inclined; and when the carriage was fairly off the *pavé*, each seemed more disposed to entertain a previous current of thought than to excite a new one. For my part, I insensibly got back to poor Urbain Grandier, and was speculating on the probable fate of his cruel persecutors, when, half an hour perhaps having elapsed, I was disturbed from my reverie by some drops of water falling on my hand. I looked about me to ascertain the reason, and could just see, by the waning light of the moon, that the bird-cage which my fellow-traveller held on her knee had slightly tilted on one side, though her hands still rested on it, and that the water which was meant for the bird was dropping upon me.

For the better explanation of our relative positions, I ought to mention that the lady and myself sat on the same side, the back seat of the carriage, which left our limbs more at liberty, and gave each of us the most comfortable corner.

'Pardon, madame,' said I, addressing my companion; 'I am afraid your cage will fall: permit me to replace it.' The lady offered no objection, but neither replied nor stirred, not even to raise her hands; so I fixed the cage in an upright position as well as I could. 'She is sleepy, I suppose,' said I to myself, my vanity putting the best construction on her indifference. 'Well, I will try to follow her example.'

I accordingly crossed my feet on the seat opposite; and settling myself well back, prepared to court the drowsy god, who generally shuns me when I travel at night. I think I should soon have been successful, for in a very short time that sense of indistinctness which precedes sleep began to steal over me; but before it had quite obtained the mastery, I was again disturbed by the dripping of water, which this time fairly trickled through my clothes. I felt excessively annoyed, not only on account of the humidity, which made me feel very uncomfortable, but because the night itself was exceedingly cold; and it was with something of asperity in my tone that I said, in a louder key than I had used before, 'Voilà qui est bien gênant, madame; prenez garde à votre oiseau, je vous prie; je suis tout-à-fait mouillé.'

But neither by word nor sign did the lady show the slightest consciousness of my having again addressed her.

'If people will go to sleep in public carriages,' I muttered, 'they ought at anyrate to be careful not to annoy their fellow-travellers!'

This truism, however, fell harmless on the ear of the sleeper; and seeing that there was nothing to be got from her, I resolved to take the remedy into my own hands. Leaning forward, therefore, I tried to withdraw the bird-cage from its place on the lady's knees; but

she held it so tightly, that I could not release it, though I employed a little gentle force to accomplish my purpose.

'Very singular,' thought I, 'that she should sleep so soundly. Why, the fluttering of the bird would have awakened me!'

But the lady was still, and so now was the canary; for as I had given the thing up as a bad job, it had recovered its equilibrium on its perch, though the cage, like the Tower of Pisa, had lost its perpendicular. Luckily, however, for me, all the water had oozed out, so I once more leaned back in my corner.

Though the roads in this part of the country are, generally speaking, very good, inequalities sometimes occur; and this I imagine must have been the case when we got to about a league and a-half from Fontevault, for I suddenly felt a violent jerk, which not only completely woke me up, but threw my companion heavily upon my shoulder, where she lay with all her weight.

'Well,' said I, 'this is rather too bad: 'can't she sleep in her own corner? People have no right to go to sleep who can't keep their balance.' Saying which I tried to raise her; but she was as heavy as lead, and, embarrassed as I was with my cloak, I could not stir her.

'Madame!' shouted I in her ear as loud as I could; 'savez-vous, madame, que vous m'écrasez? Ayez-la bonté, madame, de vous relever.' But I might as well have talked to a stone: there she lay like a log, and the villainous bird-cage still in her lap. Presently a thought struck me: I remained for a few moments perfectly still, and listened attentively—I could not hear her breathe! I hastily put my hand on her side; but there was no sign of respiration; I grasped her hands; they were clinging to the bird-cage, and as cold as ice: I felt her pulse; it was gone!

'Gracious Heaven!' I exclaimed, 'the lady is dead!' As quick as thought I raised her then, and kept her body upright; but the head fell heavily forward. In vain I eagerly chafed her hands, untied the strings of her bonnet, and strove by every means in my power to restore animation: every effort was useless. Failing in these endeavours, I threw down one of the carriage-windows, and thrusting out my head, cried at the top of my voice to the postilion to stop. The man seemed at first uncertain whence the direction proceeded: he looked right and left, then up to the place where the conducteur sat, and last of all he turned his head towards me.

'Qu'est-ce-qu'il y a, monsieur?' he said, bringing up his horses as sharply as he could.

'Conducteur, conducteur!' I called out: 'descendez vite! Il y a une dame qui meurt!'

'Sapristi!' shouted the conducteur, tumbling rather than jumping from the cabriolet, where he had been sleeping; 'qu'est-ce que vous dites, monsieur?'

'Venez voir,' said I; and he rushed up to the door.

'Bring a light, if you have one,' I cried. 'I fear something dreadful has happened!'

'Dam!' he exclaimed; 'ah, ça, c'est donc du sérieux!'

Although the moon had shone brightly when we left Loudun, she was in her last quarter, and the conducteur had not omitted the precaution of lighting the lamp in front of the diligence. He hastily ran back and brought it, and I was then able to see the features of my fellow-traveller. They were as pale as marble, and perfectly rigid; the eyes were filmy and staring, and the mouth, from which there came a slight moisture, was partly open; her hands, as I had before imagined, were firmly clenched in the wires of the bird-cage. Again I felt her pulse, her throat, her heart; but nothing stirred. The conducteur did the same. We looked at each other in silence. At length, after screwing up his mouth and shrugging his shoulders, he spoke: 'Ma foi!' said he, 'pas de doute qu'elle est morte! Quel accident!'

'What's to be done?' I asked. 'Let us get on as

quickly as we can. Perhaps if she were bled she might revive. How far is it to Fontevault?'

'A league and a-half,' was his reply, as he shut the door again, climbed up to his seat, and gave the word to the postilion to drive on *ventre à terre*.

Away we went with the speed of light, my dead companion and I, like Lenore and her lover, only the situations were reversed:

'Hurrah! the dead can ride with speed;
Dost fear to ride with me?'

I did not actually fear the corpse, but there was something particularly unpleasant in the tête-à-tête, and I felt inexpressibly relieved when, in the gray of the morning, we dashed into the village of Fontevault, and pulled up at the Croix Blanche.

The landlord of the inn, expecting the diligence, was already stirring; but if such had not been the case, the conducteur and I made noise enough to wake the whole household, who soon came crowding round us.

Unfortunately we found Fontevault so poor a place that no medical man resided there, not even the smallest apothecary. The only hope of assistance was at the Maison de Détention, once the celebrated abbey where lie the remains of the most famous of the Angevine race of English kings, Henry II. and his son Cœur de Lion, with Eleanor of Guienne and Isabella of Angoulême. We knocked loudly at the porter's lodge; but whether it arose from sheer obstinacy, from unwillingness to take the trouble, from a suspicion that some trick was afoot for effecting the release of the prisoners, or from whatever cause, the old *conciërge*, who replied to us through a half-opened lattice, turned a deaf ear to our request that the surgeon of the prison might be sent for.

'S'il y a quelqu'un de mort là-bas,' said he; 'le médecin ne peut pas le guérir; si, par hasard, votre individu est toujours vivant il se guérira lui-même.' And with these words he closed the window, and crawled back to bed again.

Further examination had in the meantime convinced everybody who looked on the unfortunate lady that the brutal old *conciërge* was right, and that the skill of the most accomplished surgeon in Europe could do nothing in such a case.

The next question was, the necessity for drawing up a *procès verbal*; but the village, which could not boast of a doctor, did not contain a single legal official, not even a stray gendarme. It was necessary that the body should be taken on to Saumur, the *chef-lieu* of the district; besides, the conducteur was anxious to get on to deliver his mail-bags. It was necessary also that I should accompany it, being the principal witness in the unhappy affair. To this I made no objection, as Saumur was the place of my destination; but I did object very strongly to continue an inside passenger. But even for this there was no help, as there was no room for me in the cabriolet beside the conducteur. Being a cross-country diligence, constructed on a pattern which few are acquainted with who have not traversed the cross-roads in the heart of France, it was provided only with a narrow seat, with a hood to it, that with difficulty admitted of the addition of Gave in her basket. Reluctantly, therefore, and with the worst grace imaginable, I re-entered the vehicle, choosing, however, the remotest corner from that which was occupied by the stiff and ghastly corpse, now fully revealed in the dull light of morning. To sleep, or even turn my eyes away, I found to be impossible; and for two long hours—mortal ones they might well be called—I sat gazing on my dreary neighbour, obliged every now and then to steady the body in its place lest it should roll off the seat.

At the *octroi* of Saumur, the *douaniers*, always on the look-out for articles to pay duty, thrust their heads into the diligence, demanding to know if there was anything to declare.

'Voilà de la contrebande,' said I, pointing to the dead

body; 'si jamais il en fut; mais je crois que tous les droits soient payés.'

The procès verbal before the mayor of Saumur added nothing to the details of this adventure, and the next day Gave and I pursued our journey.

THE UNITED STATES AS AN EMIGRATION FIELD.

It would be dangerous to trust to the impartiality of the ordinary books addressed to intending emigrants. They are almost always recommendations of some particular field, to which the author is attached by pecuniary interest, family ties, or even the mere circumstance of temporary residence. The honesty of the writers—and some of them are known to ourselves to be men of strict honour—is by no means decisive as to the value of their representations; for the proverbial deceit of the human heart acts upon itself as well as externally. Thus the biographer identifies himself with his hero, and becomes an advocate; and thus the author attaches himself to the country he describes, and is metamorphosed into an emigration touter.

A little book that has just come in our way—one of the liberal shilling's worths of this vulgar era—proceeds upon a different plan.* The compiler does not confine himself to one emigration field, and he makes no pretensions to personal knowledge of those he describes. His object is to sift and compare the testimonies already given, and lay the body of digested evidence before the public, so as to enable everybody to judge for himself. Now the value of a work of the kind must of course depend upon the merit of the author as regards industry and judgment; and as the name of Sidney Smith is familiar to most people as that of a writer and thinker of more than a score of years' standing, it would seem to be some guarantee for his fitness for the task. But for our own part, we must honestly confess that we were attracted to the book at the outset by its great *literary* superiority over other productions of the class. The compiler is, obviously, a practised writer, a working author, and is as much at home in reasoning as in describing, in philosophy as in bare statistics. The introduction pronounces a eulogy upon colonies as a refuge even for the imagination, which will show what we mean:—'Colonies are "the world beyond the grave" of disappointed hopes. The antipodes are the terrestrial future, the sublunary heaven of the unsuccessful and the dissatisfied. The weaver in his Spitalfields garret, who tries to rusticate his fancy by mignonette in his window-box, and bees in the caves, bathes his parched soul in visions of prairie flowers, and a woodbine cabin beside Arcadian cataracts. The starving peasant, whose very cottage is his master's, who tills what he can never own, who poaches by stealth to keep famine from his door, and whose overlaboured day cannot save his hard-earned sleep from the nightmare of the workhouse, would often become desperate, a lunatic, or a broken man, but for the hope that he may one day plant his foot on his own American freehold, plough his own land, pursue the chase without a license through the plains of Illinois or the forests of Michigan, and see certain independence before himself and his children. The industrious tradesman, meritorious merchant, or skilful and enlightened

professional man, jerked perhaps by the mere chance of the war of competition out of his parallelogram, and exhausting his strength and very life in the vain struggle to get back again into a position already filled; compelled by the tyranny of social convention to maintain appearances unsuited to the state of his purse; plundered by bankrupt competitors or insolvent customers, and stripped of his substance by high prices and oppressive taxation, would often become the dangerous enemy of society or of government, but for the consideration that, in South Africa, in America, in Australia, or New Zealand, he may find repose from anxiety in independence, rude and rough though it may be, emancipation from the thralldom of convention, and an immunity from any compulsion to keep up appearances, and to seem to be what he is not.'

The motives for emigration are afterwards examined in detail, and its general advantages stated; then the subject of colonisation is discussed; and we at length arrive at the emigration fields, after having gone through the necessary preliminaries of mode of transit, choice of a ship, and the voyage and the sea. In the present volume, which we presume is only a part of a whole, the author confines himself to Canada and the United States; and we shall give our readers a specimen of the kind of information conveyed on the latter part of this wide and interesting subject.

The eastern, or New England states, which extend from the sea to the Alleghany Mountains, are distinguished by rigorous winters and torrid heats in summer. They are the oldest and most populous districts of the Union; and although, from the sudden extremes of the climate, subject to consumption and other pulmonary affections, are favourable to European energy and physical development. They are the more open as a field for our labourers and artisans from the migratory habits of the Yankees, who wander into other districts where they think to become their own masters. At Long Island, New York, according to Cobbett, there is not a speck of green from December to May; and yet in June the crop and fruits are as in England, and the harvest a full month earlier. The people, however, are more sallow and spare than with us, although for this our author blames mainly the dietary arrangements of the country. 'The abundance and universal accessibility of everything that can provoke the appetite, the long sauce and short sauce, the preserves and fruits, the infinite varieties of bread, all baked in a way to lie heavy on the stomach, the endless array of wines and liquors, the interminable diversities of meats, taken at least three times every day, acting upon a people whose brain runs away with the nervous energy required by the stomach to digest such high-seasoned meals, give the assimilating organs no chance of fair play at all. Dr Caldwell tells us that the amount of sheer trash swallowed every week by an American, is greater than would be consumed in a year by an inhabitant of Europe.'

Mr Smith is inclined to give the preference to the eastern over the western states as a field of emigration for persons without capital. 'Gardeners, well-trained agricultural labourers, good wagoners, would always find full employment in the east at fair wages, *paid in money*. They would have to encounter no privations, and run little risk of disease. They would be surrounded with superior comforts, a great security for health, and endure none of the hardships of inexperienced persons in a new country. A good house, near markets, medical attendance, and the accessories of civilisation to which they have been accustomed at home, they would be sure to meet. They would not, indeed, rise to the position of proprietors of land easily, or so soon emancipate themselves from service; but

* The Settler's New Home: or the Emigrant's Location, being a Guide to Emigrants in the selection of a Settlement, and the Preliminary Details of the Voyage. By Sidney Smith. London: John Kendrick. 1849.

service is only an evil where it is coupled with dependence and precarious employment. . . . Skilful carpenters, millwrights, blacksmiths, shipwrights, shoemakers, hatters, engineers, tailors, would never have any difficulty in procuring good engagements in the east; and although the cost of food and rent is higher there than in the west, they get *money* wages, and procure clothing and many other articles cheaper than in the west.' The wages of mechanics are from L.2 to L.2, 10s. per week, and those of labourers from 4s. to 5s. per day. Women earn 3s. per day at farm work. The factories are 'models of elegance and comfort;' and the workpeople, both men and women, have almost always sums of money out at interest. But this is better still—'A journeyman brassfounder, writing from Schenectady, states he earns 6s. per day, and pays 16s. per week for board and lodging for self and wife, with meat three times a day, steaks and chops for breakfast, with pork sausages and hot buckwheat cakes, with tea and coffee, stewed peaches, apples, pears, wild honey, and molasses!'

The western states extend from the Alleghany to the Rocky Mountains; and their climate varies, according to geographical position, from six weeks to five months of winter. Ohio is an eminently agricultural state; and the population, comparatively dense, are of a decent, quiet, *rural* character. Towards the south it produces wine, silk, and tobacco, and has the roads, canals, and railways, farm-buildings, markets, inns, churches, and schools of a highly-civilised country. As a matter of course, the land is higher, and the wages lower than in places less favourably situated; but still there is abundance of employment of various kinds for the labouring or operative emigrant.

Illinois is considered the chief of the western states as regards agriculture; but having been more recently settled than Ohio, it presents fewer social advantages. 'But its climate is far superior—in a six weeks' winter, a lengthened and beautiful spring, a productive summer, and a delightful autumn. Less rigorous, and uniformly milder in all its seasons than the neighbouring states, in that alone it holds out unrivalled advantages; but when to these are added a greater quantity of uniformly fine soil, of unbounded fertility, than any other of the same extent in the world, and vast prairies of alluvial mould ready at once for plough and seed, we have said enough to prove it to be the very best of locations for the emigrant.' Live-stock is never housed—the climate does not require it; and game and fish are abundant and excellent. Timber for building is so plentiful that houses are cheap. 'Good board and lodging can be had for persons even of the middle ranks for L.26 per annum; and the ways and means of life are so inexpensive and accessible, that, except to the fastidious and finical, the settler may be said to be relieved from all but the merely imaginary cares of life.' Money is here the grand desideratum. It fetches 25 per cent.; but this of itself shows that everything else must be low, and that the value of money, therefore, in anything more than trifling sums, must be only imaginary. To grow rich in money in such a place is difficult, if not impossible; but a rude yet luxurious independence is easily attained. Illinois is a sanatorium for asthmatic and consumptive patients; but other diseases are induced nevertheless. 'Tempted by the cheapness of all sorts of liquors, the abundance and variety of food, and the extensive resources of confectionary, preserves, and made dishes, emigrants accustomed to the regimen of colder climates continue a diet unsuited to any, especially a warm climate. Disease feeds on the poison of an overfed system.'

An emigrant farmer would require a very trifling outlay of money to secure a good and speedy return. It is calculated that on the purchase of 200 acres, four cows, eight young cattle, and ten pigs, fencing, ploughing, &c. building, furnishing, and maintaining his family, he would expend only L.340, 17s. In eighteen months his expenditure would amount to L.484, 4s. 6d.; and in

that time he would have reaped 6400 bushels of Indian corn, and 1600 bushels of wheat, besides enjoying abundance of vegetables, dairy produce, beef, pork, and poultry. The farm labourer is said to be 800 times better off in Illinois than in England. In Springfield, according to Mr Sherrieff, 'market butter is worth 4d., beef 1½d., pork 1d. per lb., and much cheaper by the carcase; eggs 3d. per dozen; wheat 1s. 6½d., oats 9d., corn 5d. per bushel; good Muscovado sugar 5d., coffee 10d. per lb. Illinois abounds in all kinds of fruit in perfection. Honey, cotton, wine, castor-oil abound. Game of all kinds is in perfection.'

Opinions differ as to Michigan; but Mr Fergusson, who was employed by the Highland Society, asserts that the climate is healthy and temperate, and more favourable to European constitutions than that of the other western states. He gives the following estimate of a location:—

160 acres at 1½ dollars per acre,	L.45 0 0
Seed, labour, rail fence for 15 acres at 6 dollars,	202 10 0
Harvesting at 2 dollars,	67 10 0
Dwelling-house, stables, &c.	180 0 0
	L.495 0 0

Returns:—

Produce of 150 acres, at 20 bushels per acre, 1 dollar per bushel,	675 0 0
Profit,	L.180 0 0

Indiana somewhat resembles Illinois in climate and soil; it is mostly prairie, and well watered, and the soil is highly productive.

Wisconsin 'commands the navigation of the Mississippi, Lake Michigan, and the Canadian lakes; is very fertile, and produces wild rice in abundance. It abounds in coal and other minerals, and is in course of very rapid settlement, being the southern boundary of Upper Canada.' 'It is by far the best place in the world,' says a visitor, 'for the English farmer or rural mechanic with small capital. There is now plenty of land near this handsome seaport (Racine) at 5s. an acre, deeds included; and improved farms, with house, out-buildings, and fenced in, at from 3 dollars to 6 dollars per acre. The land here is the best I have ever seen; black loam from six inches to two feet deep, all prairie, with timber in clumps, like a gentleman's park, and suited to every crop. Garden vegetables grow in perfection, as well as English fruits and flowers. It is the best country in America for game, fish, and water; there is plenty of living water on every farm; wells can be got anywhere, and every kind of timber. Wild fruits of all kinds. The crop is thirty to forty bushels wheat, thirty to sixty Indian corn, forty to sixty oats, and barley, and flax, and buckwheat in proportion per acre. The best pasturage for cattle and sheep; hay three tons per acre. No country can be more healthy, being open, high prairies in a northern latitude. No persons are ill from the climate, only ague in the swamps.' 'The expense of coming hither,' continues this enthusiastic gentleman, 'from New York to Buffalo, is, by canal, 3 dollars in seven days; by rail, 10 dollars in two days; and by steamboat thence here, 6 dollars in four days and a-half. Upwards of a hundred farmers have come here in consequence of my former letter; not one has left. We have all conveniences—shops, goods as cheap as in England, places of worship, saw and flour mills, daily newspapers, and the New York mail every day: in short, every convenience you could have near New York; and your produce will sell for nearly as much, with double the crop on the new land.'

Iowa was formerly included in Wisconsin, and as political divisions have nothing to do with the laws of nature, its capabilities may be considered to be the same as those of the former state; but, alas! 'its population are rude, brutal, and lawless; and possessing no settled institutions or legislature, it is obvious that it will be avoided by all persons of character and orderly habits. Its miners, like those of Galena, are worse than savages. We may dismiss our account of this

region, for which nature has done everything, and man nothing, by the assurance that at present it is entirely unfitted for the settlement of emigrants, except such as

"Leave their country for their country's good."

"He has taken Iowa short," is the American phrase for a rascal who has made other places "too hot to hold him."

The following is part of Mr Sidney Smith's general summing up of the western states. 'They abound in beautiful flowers, wild fruits, and birds of every variety, and of the gayest plumage. The glow-worm and fire-fly, and butterflies of every hue are common; and the mosquitoes in the shelter of the woods are very annoying. Snakes are very numerous, of great variety, and some of them exceedingly dangerous; yet few accidents happen from their attacks. Day and night are more equally divided in America than in Europe; and in the former there is an entire absence of twilight, or gray, still evening, darkness hastening on the moment the sun sinks behind the horizon. As a general rule, roads are few and bad, and bridges still worse. Public conveyances are conducted in an inconvenient way, from the independence of the conductors upon the custom of the public; and inns and steamboats are indifferently regulated. In the former, the innkeepers bear themselves as the obliging parties, and often decline to serve customers when it is inconvenient. The beds and bedrooms are very badly managed, and the houses overcrowded. The balance of testimony is in favour of the American character for evenness of temper, deference to women, substantial good manners, with great plainness of speech and address, and great and genuine kindness to the sick or the distressed, particularly strangers, widows, and orphans. Commercial integrity is low, and there is much overreaching and sharpness in bargains and mercantile contracts. The litigious and pettifogging tendencies of the people are the result of their acuteness, logical intellect, and inferior sentimental endowments. Law and lawyers are the curse of the country, and it is emphatically said that an American will go to law with his own father about a penny. . . . The market of England is now opened for the provisions and grain of the western states, and we cannot entertain a doubt that for centuries to come this great republic must advance in comfort, security, prosperity, and every good which can make civilisation desirable, and the institution of society an element of human happiness.'

Texas has been denounced by the Land Emigration Commissioners, and our author has little to say in its favour. 'The southern position of Texas, and its capability of raising tropical productions, argue a too torrid climate for a European constitution. It is comparatively unsettled; it is a border debateable land betwixt Mexico and the United States; and it is peopled by the scum and refuse, the daring, adventurous, and lawless, of all other countries. When fully peopled, well settled, and placed under the vigorous control of permanent government and institutions, its natural capabilities will render it a desirable place of settlement.' He merely mentions Oregon, Vancouver's Island, and California. In the first, the climate and soil are unobjectionable, but everything else is bad; Vancouver's Island may offer greater advantages to the adventurous; but both of them, and California in a more especial manner, may be regarded 'as the destination only of men of desperate fortunes, and as a certain source of unhappiness to all persons of orderly, industrious, prudent, and virtuous habits. Their ultimate fate will, in all probability, be prosperous; and if the new projects for connecting the Pacific with the Atlantic by canals joining chains of lakes and rivers, or by railways or aqueducts at the Isthmus of Panama, be speedily realised, they may become much more rapidly populated and settled than is with the present means probable.'

We have now run rapidly through the portion of the volume devoted to the United States, and we do not hesitate to say that we consider the work to be a most useful and impartial publication; and even without

reference to any practical purpose of emigration, extremely well adapted for the perusal of the general reader.

THE SAILOR PRELATE.

It was in the year 1580 that Sir Francis Drake returned in triumph to his native land, after a successful expedition against the Spaniards in the South Seas. He anchored at Deptford, and Queen Elizabeth honoured the brave admiral by dining on board his ship. After the banquet, her majesty conferred the honour of knighthood on her entertainer, and inquired of him whether he wished to name any captain in his fleet as peculiarly distinguished for valour.

'So please your majesty,' said Drake, 'many there are in every ship who have borne themselves right bravely, as the subjects of their gracious mistress should; but one there is who merits praise above all, for by his steady daring alone three goodly galleons were taken. He stood himself at the guns until victory was declared, although a finger of his right hand was shot off, and he had received various grievous wounds. His name is William Lyon, commander of the Albion.'

'Let him be introduced into our presence,' said the queen; 'we love to look on a brave man.'

Sir Francis bowed, gave the necessary directions, and after a brief delay Captain Lyon was ushered into the royal presence. He was a good-looking, finely-formed man, with the blunt, frank bearing of a British sailor; in the present instance slightly dashed by a consciousness of his position. Her majesty received him with that kindly manner which she knew so well how to combine with dignity—a species of 'king-craft' which seldom fails to secure for sovereigns the warm love of their people. She asked him several questions touching the late expedition, which he answered in a sensible, respectful manner; and the queen dismissed him, saying, 'You deserve to rise, Captain Lyon; and we now pledge our royal word that you shall have the first vacancy that offers.' She then gave him her hand to kiss, and the gallant seaman retired.

About three months afterwards, as the queen on a state day was giving audience to her nobles, Captain William Lyon presented himself and craved an interview with her majesty. Good Queen Bess, among whose faults indifference to the wants and wishes of her subjects could not be classed, willingly granted his request, and smiled as she asked him to make known his wishes.

'Please your majesty, I come,' he said, 'to remind you of your gracious promise. You said I should have the first vacancy that offered; and I have just heard that the see of Cork, in the south of Ireland, is vacant by the demise of the bishop; therefore I hope your majesty will give it me, and so fulfil your royal word.'

'Gramercy,' said the queen, 'this is taking us at our word with a witness! How say you, my lord,' she continued, turning to the Earl of Essex, who stood beside the throne; 'would a brave sailor, think you, answer for a bishop in our troublesome kingdom of Ireland?'

'If Captain Lyon's clerical skill, please your majesty, be equal to so grave a charge, his worth and valour (of which I have heard much) will, I doubt not, render him worthy of your Grace's favour.'

'Besides,' chimed in the captain, as undauntedly as though he stood on his own quarterdeck, 'her majesty promised me the first vacancy; and God forbid she should be the first of her royal house who was worse than the word of their lips!'

A less absolute sovereign than Elizabeth might probably have been offended at these blunt words, and have dismissed the unlucky speaker with scant ceremony; but thoroughly secure in power, she liked to reign in her people's hearts, and besides she had the rough old Tudor love for words of truth and deeds of boldness: therefore a right royal burst of laughter proceeded from the throne, echoed by the attendant courtiers; and when

the queen's merriment had subsided, she graciously dismissed Captain Lyon, with the assurance that his request should meet with due attention. An inquiry into the seaman's qualifications was accordingly instituted, and the result as to his moral character being perfectly satisfactory, and the fact of his having received a tolerable literary education being established, the queen was graciously pleased to grant his request; and William Lyon was duly consecrated Bishop of Cork, Cloyne, and Ross.

Elizabeth said to him on the occasion, 'I trust, Master Lyon, you will take as good care of the church as you have done of the state;' and indeed, contrary to all reasonable expectation, he did make a most excellent prelate—carefully extending his patronage to the most exemplary men, and labouring with unwearied zeal to promote the interests of the diocese. He built the present episcopal palace, situated near the cathedral; and over the mantelpiece in the dining-room hangs his portrait, very finely painted. He is represented in his naval uniform, and his right hand is minus the fourth finger.

Bishop Lyon enjoyed his elevation for twenty-five years, with reputation to himself and benefit to his diocese. He never attempted to preach but once—on the occasion of the queen's death. When that melancholy event occurred, he thought it his duty to pay the last honours to his royal mistress, and accordingly ascended the pulpit in Christ-Church, in the city of Cork. After giving a good discourse on the uncertainty of life, and the great and amiable qualities of the queen, he concluded in the following characteristic manner:—'Let those who feel this loss deplore with me on the melancholy occasion; but if there be any that hear me (as perhaps there may be) who have secretly longed for this event, they have now got their wish, and the devil do them good with it!'

The remains of Bishop Lyon have recently been discovered by some workmen employed in repairing the palace. In a corner of the lawn are the ruins of what was once the chapel; and when some stones and earth were removed, a tombstone was discovered, with an inscription in old English raised characters, stating that the tomb was erected for 'William Lion, an Englis man born, bishop of Corke, Clon, and Ross, in the happi raigne of Queen Elizabet, defender of the ancent apostolike faith.'

A BOAT EXPEDITION DOWN THE JORDAN.

A good deal of attention, scientific and otherwise, has of late been directed to the Holy Land and adjoining countries; many interesting points of geography and topography have been discussed, among others, the depression of the Dead Sea, the level of which has been ascertained to be more than 1300 feet below that of the Mediterranean. The Sea of Tiberias also is reckoned as 84 feet below the latter level; the difference between the two lakes, which are 60 miles apart, being more than 1000 feet. This observation, made by the president of the Geographical Society in 1842, has elicited additional remarks and suggestions; and Dr Robinson, in discussing it, states that in the distance traversed by the river 'there is room for three cataracts, each equal in height to Niagara.'

Some authorities affirm that the observations to determine the levels must have been incorrect; on the other hand, it has been shown by comparison with British rivers, that there is nothing extraordinary in the presumed fall. The Dee is a river which may be classed with the Jordan: from the Linn of Dee to the sea, 72 miles, the fall is 16 feet to the mile; and in this distance there are neither rapids nor cataracts. In the fall of the Tweed we have a nearly parallel illustration. The question, however, has been answered for the present in another way, an account of which appears in the last published part of the Geographical Society's 'Journal.' Lieutenant Molyneux of the ship

Spartan, left the vessel at Caiffa on the Bay of Acre towards the end of August 1847, with three seamen, who had volunteered for the occasion, and Toby, a dragoman. The object was to transport the *dingy* (ship's smallest boat) on camels' backs overland to Tiberias; to proceed from thence down the Jordan to the Dead Sea, and return by way of Jerusalem and Jaffa, after an 'examination of the course of the Jordan, as well as of the valley through which it flows, and specially to measure the depth of the Dead Sea.' The commander of the vessel offered every aid, and furnished his lieutenant with letters from and to the authorities of the country, so as to facilitate operations among the Bedouin tribes, from whom molestation was to be apprehended.

Four camels were provided for the boat and baggage, besides horses. After two days' travelling, the party 'arrived at the top of the last ridge of hills overlooking the Lake of Tiberias and the Valley of the Jordan, and enjoyed a most magnificent view. Jebel Sheikh, smothered in clouds, was distinctly seen; before us were the blue waters of Tiberias, surrounded by fine ranges of hills; to the left the white ruins of Safed, perched on a hill; and near the northern end of the lake a gap in the mountains, with a green patch, which pointed out the spot where the Jordan discharges its waters into Tiberias.'

In descending the hills to the lake-shore the difficulties began. 'By degrees,' says Lieutenant Molyneux, 'the road became so steep that we were obliged to hold the boat up by ropes, till at length we arrived at a point beyond which the camels could not proceed, and to return was impossible: the stones, when started, rolled to the bottom; the camels began to roar; then followed the usual trembling of the legs—the certain precursor of a fall; and, in short, to save the boat, it became necessary to cut the lashings, and let her slide down on her keel to the foot of the hill. There we again harnessed the unfortunate camels, and proceeded without further mishap to Tiberias, where, passing under the walls of the town, we pitched our tent within a few yards of the water.'

After crossing the lake once or twice, and taking soundings and other observations, the boat was steered for the entrance of the river; and encamping for the night on the bank, the party were visited by numbers of Arabs, who, after some persuasion, left them unmolested, but kept the travellers in a state of apprehension during the night, and again the next morning for several miles of the route. The true character of the stream soon became apparent, as the officer relates:—'Hitherto, for the short distance we had come, the river had been upwards of 100 feet broad and 4 or 5 feet deep; but the first turning after leaving the Arabs brought us to the remains of a large ruined bridge, the arches of which, having all fallen down, obstructed our passage. Here our difficulties commenced; and for seven hours that we travelled that day, we scarcely ever had sufficient water to swim the boat for 100 yards together.' The Arabs hung on the skirts of the party, apparently with a view of turning any misadventure to account; and when villages were passed, the whole population turned out to look at the strangers. Sometimes the river spread out into shallow channels, in which the boat had to be unloaded, and carried over the obstructing rocks and bushes. 'The Ghor, or great Valley of the Jordan,' is described as 'about 8 or 9 miles broad; and this space is anything but a flat—nothing but a continuation of bare hills with yellow dried-up weeds, which look, when distant, like corn-stubbles. These hills, however, sink into insignificance when compared to the ranges of mountains which enclose the Ghor; and it is therefore only by comparison that this part of the Ghor is entitled to be called a valley.'

Besides other impediments, the river was obstructed by numerous weirs, built by the Arabs to divert the water into the frequent small channels cut for irrigating

their fields. It was not easy to pass these weirs without a 'row,' as the natives insisted on the gap made for the boat being built up again. In one instance the masonry was so thick and high that the boat had to be lifted over. In addition to this there was uneasiness respecting the cattle and baggage, which, writes Lieutenant Molyneux, 'were frequently obliged to diverge to a considerable distance from the river; but a capital fellow that we hired at Tiberias as a guide assisted us greatly in overcoming all our difficulties.' By and by a sheik and four Bedouins stopped the party, and demanded 600 piastres for a free passage across his territories; but after some altercation, a compromise was effected for a third of the sum.

In this way the travellers proceeded, opposed not only by natural obstacles, but by the fierce and rapacious character of the natives. In some places the river was so rocky and shallow, that it was found desirable to transfer the boat again for a time to the camels' backs. On this occasion, observes the lieutenant—'From a hill over which our road lay I had a very fine view of the whole valley, with its many Arab encampments, all made of the common coarse black camel-hair cloth. Very large herds of camels were to be seen in every direction stalking about upon the apparently barren hills in search of food. The Jordan had split into two streams of about equal size shortly after leaving El Buk'ah; and its winding course, which was marked by luxuriant vegetation, looked like a gigantic serpent twisting down the valley. After forming an island of an oval form, and about five or six miles in circumference, the two branches of the Jordan again unite immediately above an old curiously-formed bridge, marked in the map as Jisr Mejamia.' On encamping in the evening, an interesting instance of sagacity is recorded by the leader. 'I was much interested,' he writes, 'during the night, in observing the extraordinary sagacity of the Arab mares, which are indeed beautiful creatures. The old sheik lay down to sleep, with his mare tied close to him, and twice during the evening she gave him notice of the approach of footsteps by walking round and round; and when that did not awaken him, she put her head down and neighed. The first party she notified were some stray camels, and the second some of our own party returning. The Benisakhers generally ride with a halter only, except when they apprehend danger; and then, the moment they take their bridles from their saddle-bow, the mares turn their heads round, and open their mouths to receive the bit.'

For the next few days, so frequent were the disputes with the Arabs, the bargainings with new escorts, that the lieutenant was 'almost driven mad.' Sometimes the Bedouins would go off in a body, thinking to frighten him into terms; but the party were well armed, and could command a certain degree of respect. So tortuous, too, was the river, that, as we are told, 'it would be impossible to give any account of the various turnings;' and the leader was obliged to ride continually between the boat and the baggage, to ascertain the relative position of each: a railway-whistle which he had with him proved very useful in making signals. The expedition, indeed, 'was almost like moving an army in an enemy's country—not only looking out for positions where we could not be taken by surprise, but anxiously looking out also for supplying our commissariat.' With the thermometer ranging from 83 to 110 degrees, this was no enviable task.

On the 30th of the month, it having been found impossible to satisfy the exorbitant demands of the Arabs, Lieutenant Molyneux determined on proceeding without an escort; and after the place of rendezvous was reached by the mounted party, continues:—'We, as usual, stuck Toby's spear in the ground, with the ensign flying on it, as a signal for the boat to bring up, intending to proceed as soon as she arrived. The last time I had seen her was from the top of the western cliffs; she was then nearly abreast of us; and

notwithstanding the windings of the river, as the water was good, and as she had four men to pull and one to steer (Grant, Lyscomb, Winter, with the guide we had brought from Tiberias, and the man we had engaged by the road), I expected her arrival in about an hour.' The boat, however, did not arrive; and the lieutenant becoming anxious, sent out scouts to look for her, but they returned unsuccessful. Meantime he had taken up a secure position with his party, and eventually determined on going in search of the missing crew himself; but being ignorant of the language, Toby offered to go in his stead. The lieutenant then pursues:—'After most anxiously awaiting his return for an hour, he came back full gallop to inform me that he had found the boat; that she had been attacked; and that he had learned this painful intelligence from the guide and the other Arab, who were now alone bringing her down the river. . . . Forty or fifty men had collected on the banks on each side of the river, armed with muskets; and commenced their attack by throwing stones at the boat, and firing into the water close to her; and after they thus terrified the men, they all waded into the river, seized upon her, and dragged her to the shore. Lyscomb, who drew a pistol, was knocked into the water by a blow of a stick; and having got the boat on the shore, they robbed the men of all their arms and ammunition, took their hats, and let them go. They also robbed the two Arabs of their arms, and of most of their clothes, and threatened to kill them, but let them off with a beating. This was all the intelligence we could obtain; and, as may be supposed, I was thunder-struck by the recital of these melancholy facts. The guide and the other Arab had remained by the boat for half an hour, hoping that our men would return; but seeing nothing more of them, they concluded that they had endeavoured to follow me, and accordingly they proceeded down the river with the boat.'

The party were now in a critical position: surrounded on all sides by bands of notorious plunderers, and darkness coming on, added to which, anxiety as to the fate of the missing men, rendered the lieutenant truly miserable. It seemed cruel to abandon them; but the only chance of safety and succour lay in reaching Jericho as speedily as possible. The two natives who had brought the boat down were with much difficulty persuaded to take her on to the castle, and in case of the non-arrival of the party, to make their way from thence to Jerusalem, and report their position to the consul. The lieutenant, with Toby and an old man as guide and driver of the animals, then set forward; and notwithstanding the difficulties of the ground, and at times losing their way, reached Jericho, a distance of more than thirty miles, just at sunrise. The letter from the governor of Beirut was forthwith presented to the old governor at the castle; and so well did the lieutenant urge his case, that in a short time four well-mounted soldiers, accompanied by the guide with refreshments, and a note for the sailors, were scouring the country in search of them. Meantime Lieutenant Molyneux rode over to Jerusalem, where, in company with the consul, he visited the pasha, and obtained from him letters to two other pashas, directing them to send out men to the search, besides ten soldiers to assist the officer in his own exploration, and accompany him afterwards to the Dead Sea. On returning to Jericho, the boat was found to have arrived; and the next day the district of country in which the outrage occurred was diligently explored, but without obtaining any tidings of the missing unfortunates; a result which, despite a hope that the men might have succeeded in reaching the coast, threw the lieutenant into 'a desponding and gloomy mood.'

He determined, however, on accomplishing, if possible, the grand object of the expedition; and the *agha* (leader of the soldiers) was requested to be in readiness with his men the following morning. 'At last,' pursues the lieutenant, 'we reached the mouth of the river, where I was glad to find the boat floating on the slug-

gish waters of the Dead Sea. We had great difficulty in getting anywhere near the shore, on account of the marshy nature of the ground, several horses and mules having sunk up to their bodies in the mud; but at length we pitched the tent on a small patch of sound but sandy ground.'

Two soldiers were left in charge of the tent, while the officer, with Toby and two men, an Arab and Greek, embarked. 'We shoved off,' he says, 'just as it was falling dark, with only two oars, and with no one who had much idea of using them except myself, or any notion of boat-sailing. Under these circumstances, as I made sail and lost sight of the northern shore, I could not help feeling that I was embarked in a silly, if not a perilous undertaking. The breeze gradually freshened, till there was quite sea enough for such a little craft: we passed several patches of white frothy foam, and as the sea made an unusual noise, I was many times afraid that they were breakers.'

Two days and nights were passed on the bosom of the dread lake: when the sun was up, the party were scorched by the heat, as though they were in a well-heated oven; and on the second night they were chilled with cold winds, and the boat became so leaky as to add greatly to the risk. In some places the arid cliffs rise perpendicularly to the height of 1200 or 1500 feet, and only in one little gap was there any sign of vegetation: a drearier scene could scarcely be imagined. Soundings were taken three times, the deepest being 225 fathoms, and the least 178 fathoms; the lead brought up rock-salt, and dark-coloured mud. 'On the second day,' continues the narrative, 'at eleven o'clock, we got sight of the tent; and at twelve we reached the shore, quite done up, and thankful for having escaped, which none of us expected to do the night before. Everything in the boat was covered with a nasty slimy substance: iron was dreadfully corroded, and looked as if covered in patches with coal-tar; and the effect of the salt spray upon ourselves, by lying upon the skin, and getting into the eyes, nose, and mouth, produced constant thirst and drowsiness, and took away all appetite.'

'As to the alleged destructive effect of the Dead Sea on birds flying over its surface, we killed some which were actually standing in the water; and on Saturday, while in the very centre of the sea, I three times saw ducks, or some other fowl, fly past us within shot. I saw no signs, however, of fish, or of any living thing in the water, although there were many shells on the beach. I must here mention a curious broad strip of foam which appeared to lie in a straight line, nearly north and south, throughout the whole length of the sea. It did not commence, as might be supposed, at the exit of the Jordan, but some miles to the westward, and it seemed to be constantly bubbling and in motion, like a stream that runs rapidly through a lake of still water; while nearly over this white track, during both the nights that we were on the water, we observed in the sky a white streak like a cloud, extending also in a straight line from north to south, and as far as the eye could reach.'

Just after starting the next day to return to Jericho, the party saw a horseman at a distance galloping towards them, and at times firing a pistol; and we can sympathise with the leader's 'inexpressible delight that it proved to be the consul's janizary, with a letter to tell me that the three lost men had reached Tiberias in safety; he brought me also a most kind letter from Captain Symonds, enclosing a copy of the account that they had given him of their adventures. It would be a mere waste of words to state my joy at these tidings.' The boat was carried back to the coast, and on the 12th of September Lieutenant Molyneux found himself once more on board the Spartan. And until more accurate information shall be obtained, we may consider that the question as to the nature of the Jordan is answered.

We wish we could close our narrative here: but it is necessary, however painful, to add, that since the above columns were commenced, intelligence has been received

of the death of this gallant officer, which took place, through the combined effect of climate and over-exertion, soon after his return to the ship.

MR JEREMIAH JOBSON'S 'THREE DAYS.'

THE revolutions, the fall of potentates, the change of dynasties recorded in the columns of the daily press, numerous as they have been of late, are trifling and insignificant, not alone in point of number, of which there can be no dispute, but also, I suspect, in importance to the parties more immediately affected, when compared with those which sometimes occur in private life. A vivid illustration of this truth is supplied by the following transcript of a brief but stormy passage in the history—hitherto restricted to very private circulation—of Mr Jeremiah Jobson, a gentleman who for several years enjoyed a rather distinguished position in numerous sporting and fancy circles.

On the evening of Tuesday the 13th day of February last, Mr Jeremiah Jobson, a stout, portly, rubicund-visaged personage of some fifty years of age, was sitting, painfully meditative, in the large handsomely-furnished drawing-room of Mr Charles Frampton, a young but wealthy silk-mercator of famous London town. It was just between the lights, and candles had not been brought in; but the ruddy fire-blaze sufficed to trace the workings of a perturbed spirit in his flame-coloured countenance, and to bring into bright relief the object towards which his troubled glance was principally directed—namely, a new, splendidly-carved, and highly-polished rosewood pianoforte. Mr Jobson was just returned from a fortnight's sojourn with a sporting friend in the country, and the first intimation he had of the calamity with which he was threatened, was the sight of that instrument of harmony. Although a man, as he frequently boasted, of first-rate energy and unbounded resource, he was for several minutes overwhelmed, bewildered, paralysed. Crusoe could not have been more unpleasantly startled by the naked foot-print on the sand. The housekeeper—Mr Frampton was out—was instantly summoned, and a few questions amply sufficed to convince Mr Jobson that nothing but the most consummate generalship could prevent the sceptre he had so long wielded, with immense satisfaction to himself at least, from passing from his grasp: a catastrophe not to be thought of without terror and dismay.

'I always suspected it would come this way,' mused Jobson; 'and directly I saw that abominable case of wires, I knew the crisis was at hand. Pianos and petticoats, music and matrimony, generally run in couples; although'—and he laughed savagely—'there's a precious sight of difference, I am told, between the pretty tunes played before, and the airs with variations after the ceremony. To be married to-morrow, and I, as I am returned, to have the felicity of giving the bride away! Well, Heaven forgive me all my sins! I suppose I must do it. It's obviously too late to prevent the marriage: I had better, therefore, endeavour to make the best of it. As for Charles, I have summered and wintered him, and know thoroughly well how he's to be managed.' Through him I must govern the wife, since wife it seems there must be. That will scarcely prove, I should think, a very difficult task to a man of my experience and knowledge of the world. . . . Not only very handsome, but, according to Mrs Hornsby's account, uncommonly mild-spoken and amiable. No doubt she is just now—they all are before the noose is fairly adjusted—all softness, all charmingness, all distracting gammon; but the question is whether afterwards'—

Mr Jobson's troubled soliloquy was here interrupted by the entrance of a servant bringing lights. 'Is Mr Frampton returned?'

'No, sir.'

'The instant he comes in, tell him I wish to see him.'

'Yes, sir.'

The servant withdrew, and Mr Jobson resumed his melancholy musings:—

'Man is a dissatisfied animal, there's no mistake about that! Here, now, is Charles Frampton, rolling in clover without ever having had the trouble of sowing it. His father, Old Timothy, must have left him at least, one way or another, eleven or twelve thousand pounds, besides the trade and clear stock; and though we have gone the pace, his fortune can't be much diminished with such a revenue coming in from the business! He is fond of the turf, the ring, sporting of all kinds; and, thanks to my experience and advice, he is enabled to cut a dashing figure in them all. I have been his bosom counsellor and friend these five years past; I have taken all trouble off his hands, arranged his betting-book, managed his stable, his table, and his cellar for him; and yet he's not contented! The perversity of human nature is really outrageous!'

He was interrupted by the hasty entrance of his very ungrateful friend Charles Frampton, a rather good-looking young man of about six or seven-and-twenty years of age, and, like his mentor, somewhat buckishly attired.

'Ah! Jobson, my old boy, how are you? Welcome back!'—and he shook hands pretty heartily with his philosopher and guide. 'But come, Hornsby has of course told you all about it. Mrs Herbert and her sister are down stairs, and I wish to introduce you.'

'Mrs Herbert!' gasped Jobson; 'a widow! an experience!'

'A widow! yes; and what of that? She is still two or three years my junior. But come along, and judge for yourself.' Mr Charles Frampton led the way out of the apartment, and Mr Jobson, groaning heavily in spirit, followed with reluctant steps.

The introduction over, the four sat down to tea, and Jobson had leisure to observe that Mrs Herbert—Maria, as Charles Frampton called her—was really an elegant, beautiful woman, certainly not more than three or four-and-twenty years of age. Her sister—also a youthful widow, a Mrs Miley—was, he saw, a merry, keen-looking, black-eyed person, about two years her senior. After tea, Mr Frampton and his *fiancée* went up stairs to look at the new piano, leaving Mr Jobson to entertain the sister, Caroline. She seemed in exceedingly good spirits, and displayed a vivacity and archness in her conversation that quite captivated her companion. He was graciously pleased to assure her, that not only should he interpose no obstacle to his friend's union with her sister, but that in fact he was rather pleased than otherwise he had made so judicious a choice. This assurance and encomium seemed to tickle the lady's fancy amazingly, and her merry eyes twinkled with roguish humour; but when Jobson, in pursuance of the patronising scheme he had mentally resolved upon since he had seen the bride, condescended to say that he should be pleased to see her there very often of an evening, and that he would, moreover, use his influence with Charles to have her very frequently invited indeed, she burst into a laugh so loud and merry, that the room rang again with her exuberant mirth. She, however, qualified her apparent rudeness by exclaiming, as soon as she could sufficiently recover breath—'Will you really, though? Why, what a dear, good-natured old soul you must be!' The carnation of Mr Jobson's cheeks deepened several shades, and at the same time a chilling doubt of ultimate success in the struggle in which he was so suddenly and calamitously involved swept over him. Had he not known himself to be a man of first-rate energy and resource, or if the stake at issue had been less enormous, he would—so rapidly did a sense of the difficulties of his position crowd upon his brain—have abandoned the field at once. Whilst he was still dubitating, the lovers returned; and one or two rubbers of whist, proposed by Mr Jobson, carried the party in a sufficiently satisfactory manner through the evening.

The ladies took their leave early. 'Charles,' said

Jobson solemnly, as the expectant bridegroom re-entered the room, after seeing them safely off in a cab; 'Charles, did my ears deceive me, or is there a family—babbies?'

'Oh yes, Jobson; didn't I mention it?' returned Mr Charles Frampton, whose flashing eyes and flushed cheek proclaimed that he was still in the seventh heaven. 'Maria has two, I think, perhaps three—if a dozen, it's of no consequence—pictures in little of her charming self. Beautiful as angels I have no doubt they are. Maria married very early, as I told you. Of course she did. How could it be otherwise?'

Jobson snatched up his chamber candlestick, and bolted out of the room. But compassion, either for himself or his friend, induced him to return, with a view possibly to a last effort. He opened the door, but a glance sufficed to convince him of the utter hopelessness of the attempt. His once docile pupil had seated himself in an easy-chair, and, with his legs stretched at full length, and his arms crossed on his breast, was apostrophising the lady's portrait—an admirable likeness by Chalon, brought home the day before. In the mellifluous words of Moore—

'Her floating eyes! oh they resemble
Blue water-lilies!'

Jobson stayed to see no more, but slamming too the door, hastened off, and was soon in bed; for he was not only mind-harassed, but travel-wearied. 'Well,' thought he, as he laid his very uneasy head upon the pillow, 'this is going the pace—this is! Two widows, both of whom know how many beans make five, if ever woman did, and three small angels in petticoats, are pretty well to begin with at anyrate! But never mind. That black-eyed divinity laughs gaily just now; but we have yet to see who will laugh last. Charles's tastes are fixed, I know. Habit with him is second nature; and when a honey-week or so has passed, "Richard will be himself again," or I am very much mistaken.' With this consolatory prophecy Mr Jobson fell asleep.

Meantime the ladies had safely arrived at their abode in Islington—a rather genteel-looking domicile, upon the outer door of which glittered a brass-plate, intimating to passers-by that the inmates kept 'a seminary for young ladies.' They had not long arrived when a visitor was announced—Mrs Barstowe, a young and rather interesting-looking person, who, with the familiarity of an old acquaintance, hastened to exchange greetings with Mrs Miley.

'My dear Caroline, how well you are looking; and where's Maria?'

'In the next room with the milliner. But what brings you here at this time of night?'

'How can you ask me, when you are aware how much I am interested in the event of to-morrow, and that I know my brother's evil genius—that horrid Jobson—is returned home!'

'Well, if that be all, make your mind perfectly easy. Your brother is too much in love with Maria for that knave's influence to avail in preventing the match. I have told you so half-a-dozen times.'

'You have; but if you knew how constantly Charles has deferred to him for these five or six years past; that he has had sufficient influence to prevent a reconciliation between my brother and his own two sisters!'

'Well, but I *do* know all about it. I have heard the story over and over again, and can repeat it out of book. Miss Mary and Miss Jane Frampton—foolish girls both of them—married: one a young surgeon with scarcely any practice; the other, worse still, one of her father's shopmen: both very excellent persons, I dare say.'

'Oh yes; indeed they are.'

'Which silly as undutiful conduct naturally greatly offended Mr Timothy Frampton, who had other views for them both. He, dying shortly afterwards, bequeathed the whole of his property to his son, which

son, prompted by the falsehoods and misrepresentations of one Jeremiah Jobson—as paltry and mean-spirited a knave as ever existed—has adopted his father's just, but, I am sure, had he lived, temporary resentments, and refused to assist his sisters, although a sum which he would not miss would convert the businesses of their husbands, crippled for want of sufficient capital, into profitable ones. Furthermore, Mrs Barstowe, one of the aforesaid sisters, having the honour of one Mrs Herbert's acquaintance, is very anxious for the marriage of that lady with her brother, in order that through her influence the family breach may be healed, and all things end happily, as in a play. That, I believe, is about the sum and substance of the matter, Mary?

'To be sure it is. And now, *will* they be married to-morrow?'

'Most assuredly; unless Maria should change her mind, which, between you and me, I don't think at all likely. As for your brother, nothing but chaining him up could keep him from being at Islington church by ten to-morrow.'

'Oh, I am so glad! And Jobson, what is to be done with him?'

'Oh, hang the fellow; he'll be properly disposed of, never fear. And now, good-night; for I have my bonnet to try on, and a thousand things to do.'

The next morning Mr Frampton and Mr Jobson, after waiting for upwards of an hour in Islington church—the bridegroom, in his nervous dread of being too late, having arrived long before the appointed time—were joined by Mrs Herbert and her sister; the bride looking as only a young and beautiful widow in white satin and orange blossoms *can* look. The magical ceremony was duly performed, and the gay party were reseated in the carriage and on their way homeward in a very brief space of time. Mr Jobson, gloomy and dispirited, gathered himself up into a corner in silent savagery. He was, however, soon roused from the gloomy reverie in which he had begun to indulge.

'So kind and generous of you, Charles,' said a silvery voice, 'to insist that not only Caroline and her little ones, but Selina, should share my home.'

'What!' cried Jobson fiercely, rousing himself and glaring round upon Caroline. 'More babbies; your babbies, ma'am?'

'Yes, to be sure, Mr Dobson, or Jobson, or whatever your name may be. Mine and Maria's: just half-a-dozen in all!' and the black-eyed lady laughed as merrily and maliciously as on the previous evening. Jobson sank back into his corner speechless, paralysed; the thing, he felt, was getting unbearable.

'But then, Caroline,' continued the bridal tones, 'is such an excellent economist, that she will save us, I have no doubt, hundreds a year in the kitchen and cellar alone of so large an establishment, and that, too, without meanness or parsimony!' Jobson groaned inwardly, and closed his eyes: it was all he *could* do.

'And Selina is so admirable an accountant, that she will be quite able, with my assistance, to take much of the drudgery of the books and accounts off your hands; so that Charles'—here the sugar tones, Jobson reports, grew double refined—'you will be able, I daresay, to dispense with the services of the two additional assistants you thought of engaging, by being enabled to devote all your own time to the sale department.'

Jobson opened his eyes to their fullest width in order to see how his quondam pupil would relish his elevation to a permanent situation behind his own counter, and, to his utter bewilderment, saw him delightedly kissing hands upon the appointment!

'So that really it may be said I bring you a fortune, Charles, in my sisters, if in nothing else. . . Nonsense, you foolish man! Where did you learn to flatter so? Fie! But there is really one thing,' continued the bride, not at all exhausted, 'I *must* insist upon; and that is, that there be no more tobacco-smoking in any of the apartments. I declare the dresses we wore yesterday evening have contracted so intolerable an

odour, that we shall not, I think, be able to wear them again.'

Jobson listened intently, but without turning his head, for the answer to this audacious proposition. It was not long coming. There was a light, musical laugh, followed by 'Of course, how *could* you refuse a request so reasonable?' Jobson began to have a notion that this charming dialogue, or rather monologue, was chiefly intended for his own especial edification and amusement, and dire was the passion that raged within him. 'Well,' thought he, 'the "Road to Ruin," played upon the stage, takes longer than this. We have got to the end of it in much less than a quarter of the time the players take. Let me see: since we left the church we have permanently adopted another widow and a spinster, and acknowledged three extra juvenile blessings in petticoats; we have surrendered the comptrollership of the kitchen and the keys of the cellar; cash and cheque-books are of course gone with the accounts; smoking is prohibited; and we have been elected shopman to our own establishment. If that is not being polished off out of hand, I should like to know what is, that's all!' The stopping of the coach interrupted his troubled moanings; and pleading headache as an excuse for not joining the bridal breakfast-table, he sought refuge and counsel in the privacy and silence of his bedroom. Having resolved on the course to be pursued, he left the house, having first ascertained that the bride and bridegroom, who were gone a few miles into the country, would return on the morrow about the middle of the day.

Mr Jobson returned home about ten o'clock, accompanied, as was his frequent wont, by a number of jolly fellows. They all forthwith proceeded to a large room on the second floor, hitherto set apart for convivial purposes. Jobson turned on the gas, and one of his rollicking companions, with the help of a lucifer match, kindled it, when, to the utter astonishment of the gay party, they found themselves surrounded by half-a-dozen narrow iron bedsteads, tenanted by as many white-robed innocents, who, disturbed by the intrusion, sprang up on end one after another, and set up the frightfullest yelling and screaming that ever issued from juvenile throats. Dire was the hubbub throughout the house. Servant-maids, porters, shopmen, shopwomen, came running up by dozens; and finally, by Mrs Miley's directions, the entire party were very roughly and unceremoniously bundled into the street, Mr Jobson amongst them. An hour or two afterwards that gentleman quietly returned, fully resolved upon inflicting signal vengeance on the morrow.

'Pray, Mrs Miley,' said Jobson, stalking majestically into the breakfast-room on the following morning, 'at what hour is my friend, Mr Charles Frampton, expected home?'

'Mr and Mrs Frampton will be here about two o'clock. In the meantime, perhaps you will read this note, which I should have given you last night had I seen you previous to the disgraceful riot which you and your drunken companions created.'

Mr Jobson looked indignant daggers at the audacious lady; and then adjusting his spectacles, perused the note. It was from his friend Charles, and intimated that, under existing circumstances, it would be better that Mr Jobson should change his quarters. It further hinted, that in the event of immediate and cheerful compliance, all existing pecuniary arrears would be forgiven.

The rage of Jobson was unbounded. He took off his spectacles, replaced them in their case, crammed the note into his breeches pocket, buttoned it up, and stalked towards the door in awfully-indignant silence. There he paused; and presently finding words in which to void his pent-up fury, returned with menacing gesture towards Mrs Miley and her maiden sister. Selina, who continued, nevertheless, to sip their coffee with the most provoking indifference.

'I expected this, madam, ladies, women! I expected

this, I say, though not quite so soon. But a word in *your* ear, laughing Mrs Miley—the person who will have to leave this house is not Jeremiah Jobson! The habits of years, ma'am—the habits of years, I say'—

He could proceed no farther. The outbursting merriment of the apostrophised lady drowned his bellicose threatenings; and putting on his hat, and then so fiercely striking it on the crown that it came down over his eyes, and required to be pushed up again, he stalked furiously out of the room, a peal of merry laughter pursuing him to the bottom of the stairs.

A few hours afterwards Mr and Mrs Frampton returned from their brief bridal excursion; and of course the drunken uproar of the preceding evening, and the coarse insolence of Mr Jobson, were duly related and dilated upon. Mr Frampton, who had for some time been tired of a domination which long habit and indolence of temper alone caused him to endure, readily consented to his wife's proposal, that the said Jobson should forthwith be compelled to leave the house. He had previously solemnly promised her to give up associates who, if they had not materially damaged his fortune, had considerably tarnished his reputation in the eyes of sober-judging citizens, and here was an opportunity of putting his sincerity to the test, which she determined not to let slip. Mr Frampton agreed to leave the matter in her hands, not alone because she wished it to be so, though that would doubtless have more than sufficed, but because he was not only somewhat doubtful of his own resolution, but desirous of avoiding an angry encounter with a person with whom he had so long lived in terms of intimate fellowship.

'Mr Jobson is coming up, madam,' said Jones, an old gray-headed clerk, who had been in the firm since he was a boy. 'You will, I know, excuse my freedom, but I do hope the establishment will effectually get rid of the fellow at last. If you only knew the mischief he has made, the tyranny he has exercised! There are Mr Charles's two sisters, whom I have known from infancy'—

'Mrs Barstowe and her sister. They and their husbands will dine with us to-day.'

'Thank God! thank God!' exclaimed the old man fervently; and then in quite another tone he added, 'Oh, here's Mr Jobson!'

'Yes, here is Mr Jobson; and pray, old fellow, what have you to say to him, eh?' Mr Jobson had evidently been drinking to some excess.

'You had better address this lady, not me,' returned Jones quietly.

'Well, madam, and what have you to say to your husband's old friend?'

'I understand, Mr Jobson,' said that lady quite unmoved, 'that you refuse to leave this house?'

'You understand quite correctly, madam!'

'Then how do you propose to pay the debt you have already incurred for your board and lodging, which, at two guineas per week, the sum you signed a written agreement to pay when you came here, already amounts to—how much, Selina?'

'Five hundred and twelve pounds two shillings.'

'Pay? I don't mean to pay it at all!'

'And to meet this demand, to say nothing of money borrowed, there are—read the list, Mr Jones,' continued Mrs Frampton.

'One bay filly, one gray gelding, five bridles, and three saddles, in the stables. In the bedroom, two gold-mounted canes, one silver-mounted riding-whip, three greatcoats, four'—

'Fire and fagot! why, what do you mean?' roared Jobson in distracting perplexity. 'You don't mean to plunder me of my valuables?'

'Plunder you! Can you pay this debt?'

'No, I can't: no, I won't.'

'Then I have my husband's authority to say, this property of yours will be sold by auction as speedily as possible in discharge of the debt; and that whether he will sue you or not for the balance, which will be a

large one, depends entirely upon your future behaviour.'

'Why, you abominable woman, I haven't a change of linen, nor five pounds in my purse.'

'So much the better: the lesson will be the more exemplary. Now, sir, please to leave the house.' Jobson glared at her like a maniac, but seemed determined not to budge.

'Mr Jones, have the kindness to call in the porters Mr Frampton directed to remain in the passage. Now Thomas, Henry, or whatever your names are, show this gentleman out of the house.'

Infuriated but vain were the struggles of the doomed potentate. The hour of defeat had struck, his sceptre was broken, and he cast rudely and ignominiously forth, to reascend his throne no more for ever!

'My dear Mary—Jane too!' said Mrs Frampton, advancing to meet Mrs Barstowe, Mrs James, and their husbands. 'Didn't I tell you I would soon exorcise the evil spirit that so long exerted such baneful influence over your brother?'

'I couldn't have believed it,' said gentle Mrs Barstowe. 'You must be a witch, Maria.'

'To be sure she is,' said Mr James, with a significant glance at Mrs Frampton's really beautiful face and figure; 'and of the only potent species—that which operates by natural magic.'

'There—there—there; that will do,' replied the lady, smiling and blushing. 'I have, at all events, sufficient sense to know that if beauty may temporarily enslave a lover or a bridegroom, it is only kindness, gentleness, and respectful forbearance that can permanently attach a husband. They are our only lasting spells of power. I owe your brother much, my dear Mrs Barstowe; and I think, in restoring him his sisters, and ridding him of a knave, I have given a splendid earnest of my desire to repay him. But come; Charles is expecting us in the dining-room; and mind, all of you, not a word about "victory" or "triumph:" they are words which grate unpleasantly upon ears masculine. Come.'

Thus ended Mr Jeremiah Jobson's 'Three Days.' He has wisely wasted no time in foolish efforts to regain his vanished sceptre; and the last time I heard of him he was preparing to ship himself and very ragged fortunes to the brilliant Californian Land of 'Promise,' if naught else.

ROYAL AND NOBLE ECONOMISTS.

ROYAL and noble personages have not always considered it below their dignity to superintend personally their households; thus, by regulating their expenses, to prevent an undue waste and improvident expenditure. Perhaps our readers will be glad to have some illustrations of this point laid before them, which were collected during our literary peregrinations through some of the continental libraries.

Henry VII. kept memorandums, written in his own hand, of all his expenses; and the rapacious monarch maintained an economy in his palaces bordering on meanness. To quote Lord Bacon: 'In expending of treasure, Henry kept this rule, never to spare any charge his affairs required. In his buildings he was magnificent, in his rewards close-handed; so that his liberality extended rather to what regarded himself and his own memory, than to the rewarding of merit.'

Nor did the prodigal son who succeeded him, Henry VIII., fail in this respect to follow his father's example. In the great library at Paris may be seen a curious document in French, and in the handwriting of that sanguinary monarch, containing regulations for the use of the royal household. The extracts we have copied from the autograph manuscript are further interesting, as showing that our merchants' houses in the nineteenth century exhibit more elegance and comfort than was to be found in the royal palaces during the sixteenth:—

1. 'The barber must always keep himself clean, in order not to compromise his majesty's health.'

2. The treasurer shall not keep ragged scullions, who walk about almost naked, and sleep or lie down before the kitchen fire.

3. No meat beyond a certain price shall be served on the king's table.

4. The servants to furnish a sufficient guarantee to provide against the subtraction of wooden bowls and copper utensils belonging to his majesty.

5. Pewter plate being too costly for daily use, the greatest care must be taken of the wooden platters and pewter spoons.

6. No boy or commissioner shall be kept at court for the use of the servants.

7. Women who are prodigal and extravagant shall be banished the court.

8. As likewise all kind of dogs, except a small number of spaniels, reserved for the use of the ladies.

9. The officers of the king's household to live in harmony with each other.

12. The stable-boys not to steal his majesty's straw to put in their beds, as a sufficient quantity has been given them.

13. Between six and seven o'clock, the officers charged with the service of the king's chamber shall light the fire, and lay straw in the private apartments of his majesty.*

14. Coal will be only furnished for the apartments of the king, the queen's, and Lady Mary's.

15. The ladies of honour to have a piece of white bread and some beef for their breakfast.

17. A present will be made to any of the king's officers marrying—on condition they make a present to his majesty.

Amongst the French archives we have likewise examined the private journals of Charles IX. and Henry III., one of the suitors of Queen Elizabeth when Duke of Anjou. They are interesting as containing many curious facts, and throwing considerable light upon the manners and customs of the French court in the sixteenth century. In the diary of Charles IX. the most minute sums are marked down; and the monarch, to whom some historians have attributed the massacre of St Bartholomew, is frequently making presents to his old nurse, and invariably accompanying them with some such affectionate language as, 'to my good nurse' ('à ma bonne nourrice').

The regulations for the household of Henry III., and said to be composed by that depraved and effeminate king, occupy a considerable number of pages; and the extraordinary character and minuteness of some of the regulations gave rise to a well-known satire, published during his reign. In the regulations, the duties of every person about the court are pointed out. 'No person shall be allowed to swear. None shall touch the royal chair, nor sit down in it. Those entering the royal presence with their clothes in disorder shall be ordered to go out.' The dress of the councillors is described, and they are forbidden to appear before his majesty unless dressed in the manner indicated. There are further instructions for the royal household while attending Divine service. The service—in particular of the royal chamber—is of the most complicated description; and the task of the royal dressers was by no means a light one, which our readers may imagine when they are informed that Henry III. was exceedingly fond of cosmetics, and took especial care of his face and hands. The royal visage was anointed every evening with costly unguents, over which was placed a taffeta mask, in which his majesty slept.

Although but little comfort was to be found in royal palaces in these times, nevertheless they were far from being devoid of splendour. Notwithstanding the economy practised in the household department, the greatest encouragement was afforded to artists. Genius everywhere found the most noble and munificent pa-

trons, and the palaces presented a magnificence and artistical value we might in vain endeavour to find in our modern residences. A curious contrast with such splendour is found in a letter of Louis XIII. to his queen, Margaret of Austria, where he writes:—

'The season for melons only just commencing, we sought for the best that could be procured, which we should have sent, but for their spoiling before they reached you. We send you a small basket of grapes, and a small one of peaches. If it were not for the expense of the carriage, we would send you some oftener.'

Neither should we omit in the list of distinguished persons who personally directed their households, the great name of Louis XIV., to whose taste for splendour and magnificence the French nation owe the celebrated palace of Versailles, and the unrivalled galleries of the Louvre, successively augmented and enriched by Napoleon and Louis-Philippe.

There is kept amongst the Belgian archives at Brussels a manuscript containing the list of the household of the unfortunate Mary Stuart. The names and different salaries are inscribed; but we could obtain no satisfactory information as to the origin of the document, which is certainly not in the handwriting of that accomplished queen. In the library at Bruges may also be seen a written list of the establishment of Charles II. and the Duke of York, afterwards James II., when the royal exiles resided in that once celebrated and still most interesting city. It is wholly devoid of interest; and we only observed that the barber of the roving monarch was favoured with a larger allowance of beer than any other person of the household. We might mention, by the way, that the only traces we could meet with of Charles's residence at Bruges, is an account of a visit the princes paid to the company of archers of St Sebastian, of which they became members, and inserted their names in the register, which may be still seen by the curious. Queen Victoria and Prince Albert, when they visited Bruges, likewise enrolled themselves amongst the members of this ancient corporation, and added to the number of royal autographs already in its possession. To cite more modern examples of economy in the houses of the great, we find that Frederick the Great even disputed daily with his intendant about the expenses of his table, and knew the exact cost of every dish served up before him. Napoleon likewise insisted upon regulating his domestic expenses; and De Bourrienne relates that he entered into such minute details as to the expenses of the palace, that when, after a visit to Fontainebleau, the accounts were presented to him, the Emperor declared the sum for the orange-water placed in the ladies' rooms had been doubled.

Madame de Maintenon, who, with her confessor, may be said to have governed France during the declining greatness of Louis XIV., considered that her sister-in-law could with 15,000 francs (L.600) support all the expenses of her establishment. 'Meat,' she said, 'costs five sous a pound, sugar eleven. Your family comprises yourself, your husband, three maid-servants, four footmen, two coachmen, one commissioner—in all, twelve persons.

'Bread,	per day, . . .	1 franc 10 sous.
Wine,	1 ... 10 ...
Butter,	2 ... 10 ...
Wax Candles,	10 ...
Common Candles,	8 ...

'You ought not to count more than four sous of wine for the four footmen and two coachmen, and you only need two fires in the house for four months besides the kitchen fire.

'Expense during the Year for maintaining the Family, including	
Fuel, Wine, &c.	6000 francs.
Horses' keep, Coaches, and Liveries,	4000 ...
Rent,	1000 ...
Clothes, Opera, Private Expenses,	3000 ...
Salaries, and Servants' Clothes,	1000 ...

Total, 15,000 francs.

'Thus you see,' continues Madame de Maintenon,

* At this period the rooms in England were not boarded: straw and rushes being spread out in winter, and leaves in summer.

'that you are wealthy with such a sum, and ought to live like a princess.'

The expenses of housekeeping have, it is true, considerably augmented since 1679, when the above letter was dated; and we have transcribed it only as affording an example of a domestic budget in those days, and to prove that housekeeping may be allied to wit, grace, and high rank. The fascinating Marquise de Sevigné likewise managed her household, and numerous examples might be adduced from her letters showing that she knew how to regulate her expenses. Still more might be said upon this subject; but it is sufficiently shown that individuals of the highest birth, alike distinguished by their talents and position in society, have not thought it derogatory to superintend their own affairs, or, in homelier language, keep their houses in order.

PARADISE OF DEBTORS.

The number of debtors in the County Prison at York seems to be always very large: many remain a long time, evincing no disposition to leave the place; and when it is considered what a very comfortable life they pass, with large airy rooms to dwell in, no work to do, plenty of company to associate with, spacious grounds to walk in, and with the county funds ready to purchase food for them if they have not property of their own, all surprise on this score must cease, the wonder really being that there are not ten times as many debtors, which there probably would be were the attractions of the place generally known. In fact, this prison, like many other debtors' prisons, is a luxurious kind of poorhouse—workhouse would indeed be a misnomer—where the lazy and extravagant are maintained at other people's expense, and where the bare idea of being required by their labour to do something towards earning their own bread, would be looked upon as the herald of unheard-of oppression and cruelty. Of the debtors in York Castle, at the time of my visit, one had been there nearly eleven years, two more than eleven years, and one fifteen years. The governor said that he did not think these men had any wish to leave the prison. I sent for the men to have some talk with them; and the drift of their replies to my questions was, that they would not apply for their liberation, because in so doing they should have to surrender their property.—*Fourteenth Report of Prison-Inspectors.*

FROST-SLEEP—ITS CURE.

In an excursion made in the winter 1792-3, from St John's to the Bay of Bulls, North America, Captain (the late General) Skinner forming one of our party, we had on our return to cross a large lake over the ice some miles in extent. When about the middle, Captain Skinner informed me that he had long been severely pinched by the cold, and found an irresistible drowsy fit coming on. I urged him to exertions, representing the fatal consequences of giving way to this feeling, and pointing out the state in which his wife and family would be found should the party arrive at St John's without him. These thoughts roused him to exertion for some time; but when he had reached the margin of the lake he gave way, and declared he was utterly unable to struggle farther, delivering, at the same time, what he considered his dying message to his family. As there were some bushes near the spot I broke off a branch, and began to thrash my fellow-traveller with it; at first without much apparent effect, but at length I was delighted to find that my patient winced under my blows, and at length grew angry. I continued the application of the stick until he made an effort to get up and retaliate. He was soon relieved from the torpor, and as we were now but a few miles from St John's I pushed on before the party, leaving the captain under special care. I left also the stick, with strong injunctions that it should be smartly applied in the event of the drowsiness returning. I soon reached the town, and had some warm porter, with spice, prepared against the arrival of my friends; with this and considerable friction he was enabled to proceed home, where he arrived perfectly recovered. He himself related the story at the Earl of St Vincent's table, at Gibraltar, many years afterwards, expressing at the same time much gratitude for the beating he had received.—*Memoirs of Admiral Brenton.*

THE AULD MEAL MILL.

BY ALEXANDER MACLAGAN.

THE auld meal mill—oh, the auld meal mill,
Like a dream o' my schule-days it haunts me still;
Like the sun's summer blink on the face o' a hill,
Stands the love o' my boyhood, the auld meal mill.

The stream frae the mountain, rock-ribbet and brown,
Like a peal o' loud laughter, comes rattlin' doon.
Take my word for't, my freen—'tis nae puny rill
That ca's the big wheel o' the auld meal mill.

When flashin' and dashin' the paddles flee round,
The miller's blithe whistle aye blends wi' the sound;
The spray, like the bright draps whilk rainbows distil,
Fa's in showers o' red gowd round the auld meal mill.

The wild Hielan' heather grows thick on its thack,
The ivy and apple-tree creep up its back;
The lightning-winged swallow, wi' nature's ain skill,
Builds its nest 'neath the eaves o' the auld meal mill.

Keep your e'e on the watch-dog, for Cæsar kens weel
When the wild gipsy laddies are tryin' to steal;
But he lies like a lamb, and licks wi' good-will
The hard horny hand that brings grist to the mill.

There are mony queer jokes 'bout the auld meal mill;
They are noo sober folks 'bout the auld meal mill;
But ance it was said that a het Hielan' still
Was aften at wark near the auld meal mill.

When the plough's at its rest, the sheep i' the fauld,
Sic gatherin's are there, baith o' young folk and auld;
The herd blaws his horn, richt bauldly and shrill,
A' to bring down his clan to the auld meal mill.

Then sic jumpin' o'er barrows, o'er hedges and harrows,
The men o' the mill can scarce fin' their marrows;
Their lang-barrelled guns wad an armoury fill—
There's some capital shots near the auld meal mill.

At blithe penny-weddin', or christnin' a wee ane,
Sic ribbons, sic ringlets, sic feathers are fleein';
Sic lauchin', sic daffin', sic dancin' until
The laft near comes doon o' the auld meal mill.

I hae listened to music—ilk varying tone,
Frae the harp's deen' fa' to the bagpipe's drone,
But nane stirs my heart wi' sae happy a thrill
As the sound o' the wheel o' the auld meal mill.

Success to the mill and the merry mill wheel!
Lang, lang may it grind aye the wee bairnie's meal!
Bless the miller, wha aften, wi' heart and good-will,
Fills the widow's toom pock at the auld meal mill.

The auld meal mill—oh, the auld meal mill,
Like a dream o' my schule-days it haunts me still;
Like the sun's summer blink on the face o' a hill,
Stands the love o' my boyhood, the auld meal mill.

—*Scotsman.*

ENGLAND THE CENTRE OF THE EARTH.

If we divide the globe into two hemispheres, according to the maximum extent of land and water in each, we arrive at the curious result of designating England as the centre of the former, or terrene half; an antipodal point near New Zealand as the centre of the aqueous hemisphere. The exact position in England is not far from the Land's End; so that if an observer were there raised to such a height as to discern at once the half of the globe, he would see the greatest possible extent of land; if similarly elevated in New Zealand, the greatest possible surface of water.—*Quarterly Review.*

TO DETECT CHICORY IN COFFEE,

We have only to put gently into a tumbler of clear cold water a spoonful of coffee, which, if pure, will swim on the surface; if otherwise, the chicory will detach itself, discolouring the water as it sinks.

THE MYSTERY OF FRANCE.

FRANCE is a mystery to everybody: no one can tell what to make of its odd ways, or what it will by and by come to. Its people are a puzzle to the world—a terror to their neighbours. All Europe waits to see what they will do next. I have been in France some half-dozen times, and have just returned from it after a more than usually lengthened residence, during which, with nothing else to do, I mingled with native society of different grades. On this, as on former occasions, I experienced not a little perplexity. You see a fine country, rich in natural resources; beautiful towns and cities; art realising its highest aspirations; boundless ingenuity and taste; and, generally speaking, an active, obliging, and industrious people. It is quite a mistake to suppose that the French are given to idleness. Among the classes enjoying a competence there is an excess of leisurely recreation. But take the mass of the people. The rural population are everlastingly toiling in their fields, and making the most of their small possessions; and the consequence is, that the lands are for the most part kept as clear of weeds and as tidy as a garden. And so also in the towns: you see much constant and humble application, particularly among the women. We talk of the privations of shopmen and shopwomen. Go to Paris! Opposite my lodgings in the Boulevards des Italiens were several shops, in which, from eight in the morning till ten at night, a number of men and girls ministered daily without intermission—no Sabbath for these poor creatures! Every Sunday morning off came the shutters as usual, the windows were wiped and decorated as usual, and business went on as usual, as if such a thing as the Day of Rest had never been heard of. This is France: incessant toil; occasionally a fête, when souls in bondage are let loose; but no repose—no time for thought—probably no thought, if there were time for it.

An Englishman of ordinary ideas sees that the French have lost two things—religion and loyalty: the sense of God's presence in the world, and the sentiment of veneration for human authority. It may be, doubtless, a passing phase of a great people, to be succeeded in time by a better. But yet the Englishman must admit that the alleged vacuum in the national feelings does not wholly account for the mystery, for the French, while wanting what Britons think so essential, exhibit some social and moral features in which we do not approach them. Accustomed to the spectacle of refined usages and objects of taste, they possess a remarkable love of what is neat and tasteful. At no time do you observe sluttish dirtiness, rags, and brawling misery, such as the eye and ear encounter in the meaner quarters of our large Scottish towns; nowhere are seen disorderly females, unwashed and unkempt, such as

may be noticed at all hours of the day in Glasgow. Annually, in sober and constitutional Edinburgh, some hundreds of beings are carried to the police-office drunk on a barrow—such sights attracting no special observation, as if a keen sense of decency were wanting amongst us. Can any one say the same thing of a French city? On the 4th of May, I walked the streets of Paris from morning till night. Along the chief thoroughfares, towards the scene of festivity, crowds of people from the eastern faubourgs streamed in a ceaseless flood; and finally, at a late hour, all returned peacefully homewards: it was a grand sight, that stream of well-dressed people; it was civilisation of a high order. For all that day there was not heard a high or coarse word, nor was there seen any jostling or act of rudeness. 'The French,' said I, 'know how to behave; they can be happy without being disorderly.' I write this in Edinburgh on the Queen's Birthday: it is a day of general rejoicing—that is to say, the bells are ringing, and there is a good deal of hard drinking. Some lads for the last two hours have been amusing themselves next street kicking about an old tin kettle; and at this moment, vomited from a public-house, two tipsy men are fighting under my window. Is this civilisation, or what?

It is tolerably clear that the people who can endure favourably comparisons of this kind, if not in all respects estimable, are deserving of a greater share of admiration than is usually accorded them. Vices and crimes abound in Paris, and are perhaps of the darkest shade; but the people are, in the main, orderly, decorous, and well-disposed. The very dregs of the community, when in open insurrection, do not steal—in arms for a political cause, they would scorn to be thieves. Let this fact be compared with the conduct of the band of insurgents who for an hour plundered the shops of Glasgow. Nor do we find, even among the better classes of French society, anything like that far-sighted cunning which has lately come out so strong in the English character. Their Mississippi Scheme—the invention of a Scotsman—may well balance our South Sea bubble; but the *entrepreneurs* of the Parisian gambling-houses have been outdone in swindling by English railway speculators. On these various accounts the French cannot, without prejudice, be spoken of contemptuously. With all their faults, they are a great people. It is because they are great, and can make themselves respected, that we feel so much interested in getting at the bottom of that mysterious unsettledness which affects their public career. In a people who can be so assiduously industrious, and do such marvellous things in art, science, and literature, we might naturally expect the ability for constructing a government on a solid basis; but from all experience, it is evident that this is precisely the one thing they cannot do.

A defect so remarkable in the character of a nation might very properly engage a degree of philosophical inquiry beyond the scope of these limited pages. In a glance merely at the subject, however, it could probably be shown that the recent and prospective misfortunes of the country are due to causes which lie on the very surface of history. It is fashionable to trace national idiosyncrasies to the effects of race. Essentially Celtic, the giddy impulsiveness of the French character is ascribed to something in the physical constitution. It might be improper to meet this species of allegation with a point-blank denial, though it is very evident that the pure descendants of French families in England are in no way distinguishable in regard to solidity of understanding from the oldest inhabitants of the country. Without venturing further into this delicate matter, I am inclined to impute the whole—or very nearly the whole—of the French incapacity for government to the plainly obvious reason, that they have never been taught. 'Tis education makes the man—not meaning by that merely school learning, but the rearing up of habits, through the daily influence of example, from generation to generation. When the Englishman sits down comfortably at his fireside, and congratulates himself on the steady working of the institutions which shelter his life, his liberties, and his property, he is, I fear, not sufficiently cognisant of the fact how all this was brought about. On comparing the course of events in English and French history, the source of our security and French insecurity is revealed. From the most remote times, self-government of some sort has been habitual to the Anglo-Saxon race. From the forests of Germany, they brought with them the practice of wardmotes and juries. This was but the A B C of their learning. Substantially, they owe their training in constitutional forms to their kings. Municipal privileges—that is, powers of local self-government by delegation—were communicated by the sovereign to bodies of traders in towns, as a make-weight against the encroachments of the barons; and it was this alliance of the people with their kings that is the fine feature alike in English and Scottish history. In France, on the contrary, the kings and the barons united to oppress the people, and keep them in a state of tutelage; even the church, usually favourable to popular claims, was in France, up till the period when repentance was too late, an arrogant, overbearing corporation. It is trite to remind the reader, that when the Revolution of 1789 broke out in France, all power whatsoever was in the hands of the crown, the nobility, and the clergy. The privileged orders, as they were called, ruled everything, but contributed nothing. The people, viewed as objects of taxation, alone furnished means to carry on the operations of government. The slightest concession of the nobility and clergy to pay a trifle towards the disembarassing of the finances, would have averted the Revolution. We all know what the privileged orders would have afterwards given to recall their fatal opposition. Have they not been punished?

Everybody likewise knows how the French people, suddenly and unpreparedly admitted to self-management, have gone on blunderingly till the present moment. Had Bonaparte been in all things an enlightened despot, he possessed the means, as he had the opportunity, of conferring charters of self-government on communities sufficiently enlightened to have merited the privilege. So far, however, from doing so, he strengthened and perfected the principle of centralised

government—put the whole nation under the supervision and control of the executive in Paris. No doubt it was an important object with the early revolutionary authorities, to unite the hitherto disjointed provinces and towns in the new and uniform departmental system; and yet in this by no means discreditably-executed arrangement, they only perpetuated the elements of social disorder. The people still remained pretty much in their ancient state of tutelage; were not taught to depend exclusively on themselves for local government; did not so much as learn how to meet, consult, and petition for a redress of general grievances. The successors of Napoleon continued the same deadening policy. Guizot, with all his philosophy, did nothing to temper or elevate the spirit of a democracy against which he is now pleased to declaim. He found the French people children in the art of constitutional government, and he left them so.

The pernicious principle which enables a minister in Paris—no matter how installed—to command a whole nation by telegraph, is aggravated by the passiveness, which has grown into a habit, under the process of property distribution. Abstractly, the law of equal inheritance may be just; but in France it has undeniably the effect of disposing the vast body of peasant proprietors to take no deep interest in dynastic convulsions. What care they about 'rallying round the throne?' One throne to them is as good as another: their fields yield their produce as plenteously under a republic as a monarchy. Only when the screw of taxation receives an additional twist, do they begin to feel that King Log would, on the whole, have been preferable to President Stork. Whether arising from the same cause, or otherwise, it is certain that the French are the least inclined of any people in Western Europe to push abroad into the world with a view to bettering their circumstances. Kept at home by their ignorance of foreign languages, their love of country, or their comparative indifference to commercial gains beyond a limited point, they are further restrained from dispersal by the hopes of honours and place. The Legion of Honour is an exchequer as inexhaustible as the manufactory of ribbon from which it draws its supplies. Even youth owns the potency of decoration. A reasonable distribution of cocked-hats and swords is discovered to inspire flagging schoolboys with a love of France, glory, and grammar; and not to be behind in sentiment, criminals yield a becoming obedience, provided they are marched to work to the efficacious strains of a tambour. Place, however, is the solid material on which general subserviency is erected. The free resources of the country are literally eaten up by a host of functionaries decked out in every variety of uniform. The whole civil functionaries in Great Britain dependent on the state are under seventeen thousand in number: in France, the number is upwards of half a million, and as many more are looking for office. Demoralisation, by the dispensation of petty offices, is thus a powerful engine of authority. The French government maintains a vast variety of trading monopolies, not for purposes of revenue, but compensation and bribery. One of the ministers lately entertained the Assembly by a statement, that he had on his hands as many as twenty thousand applications for the privilege of retailing tobacco; each applicant putting forth some special claim for state favour! An eager pursuit of place among restless politicians and a redundant body of *littérateurs*, of course go far to explain the recurring phenomena of French revolutions.

To an Englishman who gives any consideration to the aspect of French society, nothing appears more inconsistent than the letter and the practice of the new republican constitution. With '*Liberté, Egalité, Fraternité*,' inscribed in wearisome repetition on the walls of public buildings, with trees of liberty planted in mocking profusion, the people—at least those whom I had the fortune to converse with—appear to be in a condition of infantine ignorance respecting what constitutes the first elements of freedom. All their revolutions, all their changes of forms, still leave them at the mercy of fiscal regulations diametrically opposed to the principles for which they have freely shed their blood. The nuisance of passports, preventing all freedom of locomotion, except by permission of a magistrate, is continued in all its ancient virulence. At every public meeting commissaries of police possess a legal title to appear officially; to overawe the speakers; and, if they think proper, to turn all to the door by means of a company of soldiers. The same functionaries, backed by gendarmes, exercise the authority of paying domiciliary visits at the dead of night, and carrying off all papers for which they have a fancy: no redress. Persons taken into custody for any alleged offence are kept in prison for any length of time without trial: preliminary public examinations, with the privilege of giving bail, are unknown: practically, whatever be the law on the subject, there is no *habeas corpus*. In the single word '*conscription*' we have a whole chapter of horrors; but I content myself with noticing, that not until a young man has passed the ordeal of the ballot, in his twenty-first year, does he possess the privilege of being married: the demoralisation arising from this cause alone is beyond computation. Now, the surprising thing is, that none of those despotic regulations is made the subject of general complaint: they are submitted to, possibly with fretfulness; but no movement takes place towards their removal or modification. Indeed every new convulsion may be said to rivet them the more closely on the country; for every fresh executive, feeling the increased criticalness of its position, is obliged to maintain itself by restrictions on liberty, which no staid monarchy, like that of Britain, finds it requisite to employ. A government in danger is always seemingly tyrannical—breaks through all constitutional principles and forms, and scruples not to set aside any law that is opposed to its self-preservation. Hence I can really see no end to the series of revolutionary troubles in France. A century may elapse before the people acquire the habits of thought essential to a state of freedom. They will, to all appearance, go on destroying government after government, in expectation of finding something better; while all the time, their imagined corrective is but aggravating the disorder incidental to their unhappy condition.

I left France with gloomy forebodings of the future; nor did I find any person in my journey who entertained the most distant hope that the then present state of affairs could last. Unfortunately, no one can exactly define what form of government is at once practicable and expedient. There is a chaos of principle—antagonisms impossible to be reconciled. In the political paroxysm of 1848, forms were established thoroughly at variance with national tranquillity, and yet which it does not seem to be in the nature of things to abolish. The deliberative power given to the army would alone rend a state in pieces; though this weak point in the constitution is probably less fatal than the reliance on a National Guard, which considers itself entitled to assist

the constituted authorities only when in the humour to do so. Whether without passing through the furnace of a civil, or the distractions of a foreign war, France will be able to compose her internal differences, is a question deeply affecting all Europe. Let her be at least assured, that England looks on her struggles towards an improved and settled government with anything but an unfriendly or jealous spirit, with indeed a degree of sympathy and solicitude very unlike the feelings which once unhappily prevailed between the two countries.

W. C.

THE EMIGRANTS.

A STORY OF THE BACKWOODS.

A YOUTHFUL newly-wedded couple were preparing for the decisive step of emigration to one of the North American States: it might be called *decisive*, because, under any circumstances, they contemplated no return hither. It is unnecessary to detail all the reasons which determined these young persons to abandon their fatherland and the amenities of cultivated society, for a retired and self-denying residence amidst the primeval forests of the 'far west.' It may be sufficient to remark, that they were every way creditable to them; and that, while their wishes and expectations were moderate, their energies were braced to meet, in a firm spirit of self-relying industry and courage, whatever inconveniences or disappointments might await them. On one all-important point they felt satisfied—namely, that strong mutual affection must be the foundation of every step in the path of life they had chosen. Amidst the dimness with which the visions of their futurity were blent, *this* only seemed clear. They were voluntarily about to leave, perhaps for ever, the luxuries and appliances of polished society, together with all the ties of kindred and friendship which had hitherto smoothed and beguiled their young life's journey; and they felt, therefore, that the love must be of the nature of an enduring, self-denying tenderness, which would make them all in all to each other, and which would cheer whatever solitude, and make amends for whatever privation, they might have to encounter in their wilderness lot. On this main point, then, their youthful hearts were at rest: they had long been intimately acquainted with, and almost as long fondly attached to, each other. But in other respects they were also peculiarly fitted for the mode of life they now anticipated, and it was probably an intuitive perception of this fact that finally influenced their decision, so they set themselves cheerily to their multifarious preparations.

'I shall make a much better farmer than I ever should a merchant I feel confident,' said George Hadley; 'and now my early *penchant* for edge-tools will, I hope, find useful exercise. I think I shall be able to make something better than clumsy—that is, *very* clumsy—tables and chairs for our new home.'

'And I,' said his wife, with a fond responsive smile, 'am getting rapidly into all the mysteries of home-brewing and baking. I was not idle during my late short visit to Cousin Grace, at her country cottage, though she did stare prodigiously at my anxiety to *pry* into the depths of everything. I often think of Aunt Jane's lesson, and will even have a hand in every dish we have upon the table. Aunt Jane, you must know, promised a particular provincial pudding to a *very particular* English gentleman. She felt sure she knew the ingredients necessary, the proportions, and how to mix them, having often done it: but alas! she knew not how, or the proper time, to cook it. When she had learned to make pies and puddings, the cook or a baker finished them: here she was at fault, and to her shame and mortification the pudding was spoiled and uneatable.'

Thus they encouraged each other, and chatted over their prospects and plans, till the time of leave-taking

arrived. Here they did wisely also, we think: they made no formal farewells; but having incidentally mentioned their intentions to each of their friends, so as to feel assured it would not be taken amiss, they quietly slipped away by themselves; and thus, as Marion said, when she stood on the vessel's deck, and looked her last on England, the gaze was not dimmed by friendship's tears, but the past looked bright, as did the future.

They had collected rather a formidable equipment of articles for personal and domestic comforts, as it was one of their aims to retain as many of the *agrémens* of the past as their future position would justify or admit of. In one particular they practised praiseworthy self-denial: they were both passionately fond of music, but, fearing lest this pursuit should tempt them to sacrifice to it too much of their time, after some consultation they agreed to take no musical instruments or music with them. We shall just add, that they had unitedly about two thousand pounds; a capital which would go but a little way in their rank in Britain, but which is ample for a settler in a colony who is contented to begin moderately.

After a pleasant voyage, George and Marion Hadley landed in New York. There they immediately sought, and soon obtained information, as to the best district to which to proceed. For the most part all things went favourably. They secured a farm, partially cleared, which the occupant, from various misfortunes, was obliged to resign, and which their romantic wish to be *alone* induced them to prefer to others, from its isolation, and being rather out of the track which the tide of immigration seemed likely to take. They had a fancy to keep their home retired amidst the wilds, even should townships arise at no great distance around them.

At the last place on the borders of civilisation, our emigrants provided supplies of such additional things as they seemed likely to want, with wagons and assistants to convey them to their destination. This was the most toilsome part of their long journey; still novelty, curiosity, the longings, and even the suspense of hope, made it pass gladsomely. But yet, hopeful and light-hearted as were Mr and Mrs Hadley, it was not in human nature, when their future resting-place was reached, not to exchange a look that seemed to say, 'Shall this desolate spot ever become the paradise we have dreamed of?' The fence, originally but partial, was now lying broken down and destroyed; the unsightly stumps and tangled ground, a half ruinous log-house, and the dark interminable forest, amidst whose gloomy recesses the strong breeze was sighing what sounded more like a melancholy dirge than a cheerful welcome—these were the dark features. But the summer sun shone gloriously; a cluster of majestic trees shaded and sheltered the dwelling; a few apple-trees were even now bending beneath their load of fruit, and some cultivated rose-bushes showed that here a garden once had smiled, and might smile again. The house was hardly fit to shelter the newly-arrived, with their goods and chattels; their first care, therefore, was to arrange for assistance in the erection of a new and more commodious dwelling. This, where wood was so plenty, and wood nearly all that was required, was soon accomplished. The walls were of rough logs, inside they were neatly boarded, and afterwards varnished: the roof was also of boards, with tar and bark instead of slate or tiling: there was a light and spacious kitchen, and above it a comfortable room, intended for guests: there was no hall, but directly opening from the kitchen was a good apartment, which might be called a parlour from its furniture and appointments; and still within, leading from it, was the chamber, or *sanctum sanctorum*—very snug, yet light and cheerful, its window looking to a pleasant glade in the solemn wood, where Marion felt sure they should find some agreeable walk; and in fact they did find so many, that on that side they allowed the stately trees to remain in their ancient majesty. Hardly was the house made

habitable, ere the team was at work for the autumn sowing; and then succeeded winter, with its fence-making, and almost equally important in-door employments, completing the domestic comforts; and then they called their home 'Young Hope Farm.'

But it is not our intention to follow these settlers through all the details of their transatlantic residence. Suffice it to say they prospered. Their moderate wants were soon abundantly supplied from their own farm, and chiefly by the work of their own hands; for, except in spring and harvest, one stout servant-girl was all their help. Marion had a small dairy, she had poultry of the finest kinds in abundance, and she raised in the garden the only ornaments they cared for—the flowers of their country. George cultivated excellent fruit; he followed his plough, and superintended in person every operation of the farm; while for healthful recreation, and a pleasant variety to their table, he had his gun and plenty of unrestricted game. In the evening they had a few well-chosen books, or, if busily engaged with their hands, they often joined their voices in some of the melodies of home, and concluded with a grateful hymn of praise. Happily passed their time, not a moment unemployed; and they cast not one 'longing, lingering look behind.' But, monotonous as to some this life might appear, unvaried by friendly greetings or pleasant reunions, and uncheered by Sabbath bell or social worship, yet one or two incidents befell Mr and Mrs Hadley of interest far surpassing the average of those in our every-day existence; and these it is our chief object to narrate, as tending to illustrate how a self-possessed demeanour and a generous heart will meet exigencies the most trying, and eventuate in results the most satisfactory.

The following, as the preceding incidents, are strictly true. One of them we should especially shrink from having the hardihood to invent; and it is another proof of the trite remark, that the romance of real life is often more highly wrought, and more deeply affecting than any fiction, however well drawn:—

One hot bright day in the early harvest of the year succeeding their arrival in America, Mrs Hadley was engaged in the cheerful, cleanly kitchen, making preparations for their mid-day meal, of which several labourers in the harvest-field had also to partake. Her husband, as usual, superintended his work, and even the servant-girl had gone out to assist. Mrs Hadley had her face turned from the window; but as she saw one shadow after another darken the opposite wall, she raised her head to glance at the wooden clock, to see if it were possible that the dinner-hour had brought her labourers from the field. What was her surprise and consternation to see the dark figures of several Indians walk into her presence with noiseless tread and in utter silence! She had always felt an undefined but extreme dread of these savages, often represented as so terrible, and had shudderingly imagined such a circumstance as now occurred; but hitherto she had never seen any of them, so that the novelty, the suspicion, and her unprotected situation, caused her heart to sink within her. It was only for a moment however.

When two men had entered, she was relieved to see them followed by a young woman, carrying on her shoulder a little child, and whose timid stealing steps formed a striking contrast to the bold and confident bearing of the men. Mrs Hadley, rallying her courage, and endeavouring to appear quite unmoved, courteously greeted the intruders. Though they could not understand the import of her words, her gesture and her smile were nature's well-understood telegraph of kindness and welcome. The men exchanged one syllable, it seemed to her of satisfaction, and continued to gaze earnestly at every object they saw around them. One of them was tall, and seemed advanced in years; the other was young, and was the husband of the female. Mrs Hadley, observing that the latter was almost sinking from heat and fatigue, took the child from her arms, caressed, and gave it a large piece of

white bread, which it eagerly ate, and then a draught of new milk. She then lifted from the ample pot that hung over the fire a mess of savoury soup, which she placed on the table, with spoons, and pointed to her uninvited guests to eat. They looked at each other, at the food, and at her, but said and did nothing. Eager to propitiate their good-will, as well as anxious to fulfil the duties of hospitality to any of the brotherhood of man, the hostess seated herself at the table, took a spoon and a piece of bread, and began to eat, as if inviting and showing her guests the example. She then resigned her seat, and was pleased to see the men gravely, yet with the utmost propriety, eat as they had seen her do, though in all probability they had never handled a spoon before. Meanwhile the female had meekly squatted down at a respectful distance from her lord and father; and Mrs Hadley, recollecting that the Indian squaws do not eat with the men, placed before her some of the nicest of the meat and vegetables. The young woman—for she seemed scarcely above sixteen—looked sad and very gentle, yet smiled thankfully and admiringly at the kind and comely white woman.

Short time sufficed for the strangers to make a plentiful meal, after which, seeing a pitcher of water by, they drank eagerly, and then, with a gesture of stately courtesy, stalked away, having hardly uttered a word during their visit. As they were departing, Mrs Hadley, seeing the child much attracted by a handkerchief she wore of many-coloured silk, took it from her shoulders, and spread it over the poor babe's uncovered skin, to protect it from the fierce rays of the noonday sun. The mother more than once looked back with a deeply-grateful smile, and very soon they were all out of sight amidst the forest.

Mr Hadley was much annoyed by this occurrence, and thought it only prudent that his wife should not again be left alone, for fear of a similar or a worse alarm. They saw no more Indians, however, till the fall of the following year. By that time they had a little girl of their own; and one day when Marion was lifting her from her cot in the inner room, she suddenly saw a dark and frightfully-painted countenance glaring in at the low window. Again she preserved her coolness and composure, though the effort was even greater than before; for ere she could call her husband, who was not far off, the house was surrounded by eight or ten fearful-looking savages. This time, as no females were with them, Mrs Hadley justly concluded that they were a war party, and might be bent on mischief. With her child in her arms, she hastened into the kitchen, and warned the servant-girl of their unwelcome neighbours, commanding her on no account to display the least distrust or displeasure. Hardly had she had time for this communication, when the armed warriors crowded into the house, unceremoniously, yet with the appearance of harmlessness; and she soon had the pleasure to recognise among them the elderly man who had formerly visited her. He advanced to the fireplace, and looked as if for the great boiling pot; but there was none there that day. The hostess, however, understood him; and smiling at him (she afterwards averred it was a very faint-hearted smile), as if to let him know she did, she brought a large bowl of sweet milk and a basket of wheat cakes, inviting the Indians to partake, which they did, but without seating themselves. Mr Hadley soon after stepped in, his gun on his arm, and looked aghast when he saw by whom his kitchen was occupied. One of the Indians instantly wished to examine his fowling-piece. Alarmed at the danger, and anxious to make an impression on the wild strangers, George first fired it off at one of his own pigs that had strayed near. Most of the savages started, uttering exclamations of surprise, and then leaped to the dead animal, to examine it more closely. When he saw their excitement and frantic gestures, he began to fear he had not acted wisely; certainly he had not exercised the prudence and self-command his Marion had done. Some of the

warriors remained within the threshold, and appeared acquainted with the use of fire-arms; so George loaded again as composedly as he could, while his brave wife observed suspended round the neck of one of them a well-used tobacco-pipe. By her suggestion her husband offered a supply of the weed he never used himself, but kept for the use of his visitors and labourers. This courtesy was received by the Indians with every mark of satisfaction, and shortly afterwards they took their wished-for departure. After this scarcely a year passed that some parties of Indians did not call at the farm, and never without interchanging marks of hospitality and good-will, till it seemed to be generally understood that these white people and the Red Men were friends and brothers.

A few seasons now glided peacefully past with Mr and Mrs Hadley. They still enjoyed in a great measure their beloved retirement; only one family had become domiciled within five miles of them. But that is near neighbourhood in the backwoods; so these solitary families occasionally interchanged visits. 'Few and far between' were they, it must be said, except when some neighbourly assistance was required of either. Perhaps it was a candlemaking, or a grand maple-sugar-boiling, or it was to look after the house during a confinement; on the whole, it was agreeable to all parties. Mr and Mrs Oswald had, like our friends the Hadleys, emigrated on the strength of love and industry; but they were not so fortunate, perhaps not so judicious, as the others. The lady had been tenderly nurtured, and was little fitted to sustain the roughnesses an immigrant family has, especially at first, to encounter. Moreover her health was delicate, and her family increased rapidly: three children they had carried with them, but only one survived to reach their future home. This damped the youthful pair at the outset. Still Mr Oswald and his interesting wife were happy, for they were contented and affectionate; and the husband (an energetic Irishman) was indefatigable in industry and a desire to do well.

Mrs Hadley had put her two little girls to bed one stormy autumnal evening, and was looking forward to a few hours of tranquil industry by their happy fireside, when the kitchen door was heard to open, and a female voice spoke in accents of grief and anxiety. George hastened to ask what was the matter, and found it was the servant-maid of their friends the Oswalds. She had come to ask Mrs Hadley to go immediately to her mistress, who had been taken seriously ill. Their only farm-servant had met with an accident that had quite disabled him, and Mr Oswald himself had ridden off for the nearest surgeon, a distance of sixteen miles. The girl seemed much excited and distressed; and Marion, knowing the delicate state of her amiable friend, was deeply concerned.

'What shall I do, George?' she exclaimed; 'a night of storm, and such a road! Had it been during daylight, or could you have accompanied me. But I could not be easy if both of us were to leave our children.'

'Had not I better go?' asked the husband sympathisingly.

'Ah, I suspect it is I that ought to be with her: poor Lucy! Yes, I will go without more hesitation. Get the mare saddled for me: I will leave this girl with you, and take our Betty, as the more efficient assistant. Hasten, dear George, and I will get ready some little matters that may be necessary.'

'Wrap well up, then, my love,' said George; for he felt he dared not oppose his heroic wife's proposal, the necessity being so pressing.

After a fervent kiss, and a 'God be with you, my dear, on your errand of mercy,' from her husband, Marion was seated on the steady animal, and Betty trudged resolutely by her side. The wind howled dismally, sweeping showers of withering leaves to the ground at every blast; and masses of black clouds were careering past the moon, then, fortunately for the night-travellers, near the full. The hardly-to-be-distinguished pathway was

broken and rugged; but the mare knew it pretty well, and after a short time Mrs Hadley proposed that her servant should try to ride behind her, thinking they would thereby get on more rapidly. This was done, and the strong sagacious animal stepped out more surely and swiftly, as if aware of the confidence and responsibility reposed in her. In fact, in a time which, even to their anxiety, seemed short, the good Samaritans reached Mr Oswald's dwelling.

Marion knew that there were none to receive or to greet her; but all the more eagerly she hastened into the house, leaving Betty to attend to their steed. The kitchen was in darkness; a large house-dog sprang growling to meet the guest, whose arrival would doubtless be so welcome; but almost immediately recognising the visitor, the animal retired to the cheerless hearth whining piteously. There was no other sound to be heard, and Mrs Hadley hoped her suffering neighbour might be asleep, as the children doubtless were; so she stepped softly into the family room. A light burned dimly near the uncurtained window: it had been placed there as a beacon to light the *absent* home. The wood-fire had sunk low, but the regular breathing of sleepers was distinctly heard. When Marion had snuffed the candle, she saw the eldest boy, who was eight years old, with his head laid down on the table before which he sat; another little fellow, stretched on the floor, carefully covered with a cloak; and the youngest on his mother's bed, which stood in a corner of the apartment—all fast asleep. No word, or whisper, or sigh came from the invalid. Marion held her breath while she stooped over to listen for her friend's, and only the increased throbbing of her own heart was audible. The stillness was oppressive. Alas, alas! it was that of death—the mother lay a corpse, surrounded by her sleeping children! Alone, unaided, she had perished in nature's extremity! The appalled gazer soon became too painfully convinced of this fact; and the pulses of her own life almost stood still, as she beheld the once lovely countenance distorted by pain and sorrow, and fixed in its last unconsciousness. Marion was a brave-hearted, but she was also a deeply-sensitive woman. Here was wo indeed! In the whirlwind agony of that moment she perceived all its bitterness; yet the lightning glance she permitted herself to take of the circumstances, also disclosed to her what was required of herself. She stooped over the dead, and closed the glazed eyes, and smoothed the convulsed muscles of the face; then with a heavy bursting sigh she took in her arms the hapless child that slumbered on its mother's deathbed, and tenderly kissing, she laid him in another and less sorrowful resting-place: his little brother she soon nestled beside him, and then she gently touched the sleeper at the table. The poor child started, as if distressed that wearied nature had overcome his intended and promised watchfulness.

'Has papa come back?' he asked. 'Is mamma better? I am so glad you are come, Mrs Hadley!'

'Go to bed beside your brothers, my dear boy—you must be sleepy,' said his sympathising friend, deeply affected to hear him name his mother, whom he idolised. 'Your papa will soon arrive now, I daresay; and in the meantime I will see to everything.'

The boy looked wistfully to his mother's bed, and whispered, 'Mamma is surely asleep—she was so ill, and groaned so sadly; but when Ann went for you, she was better, and I gave her a drink; and then she told me to sit down and watch the children, for they were so sleepy and cross they would not let me put them to bed; so they fell asleep, and I waited, and waited, and at last I could not keep awake, I believe; but I hope dear mamma did not want me.'

'I daresay she did not, my dear; so go to bed now.' And to bed he went.

Mrs Hadley had a severer task to restrain within bounds the expression of Betty's horror and dismay than her own feelings. She at length prevailed on her to assist in making the house more comfortable, for it

was too apparent that all that day's work had been left undone. A fire was made to blaze cheerfully, the rooms swept, the kettle boiled, and tea prepared to refresh the gentlemen, now momentarily expected, though one of them at least, both females thought, and Betty said, could hardly be expected to partake of it. All these cares were scarcely completed, when a horse's trampling was heard; and Marion was thankful the surgeon had first arrived, so that some preparation might be thought of for the husband, bereaved under such distressing circumstances.

The medical man attempted all he thought possible, in case the poor lady might yet revive. It proved unavailing, and the living now were first to be thought of. Mr Oswald, exhausted by fatigue and anxiety, hastened as fast as his jaded horse would carry him; yet dreamed not of the fearful blow awaiting him at that home where he had so often met his Lucy's smile of welcome. But we shall not attempt to paint the scene on his arrival. Henry Oswald, notwithstanding every tenderness of preparation that circumstances admitted of, was at first almost stunned into insensibility; and I am sorry to say, afterwards acted the part of an utterly distracted person. The warm-hearted, impulsive Irishman yielded to paroxysms of sorrow and despair unworthy of a brave or a Christian man, and subversive of his duty to his helpless children.

Almost as soon as the cheerless morning had dawned, Mrs Hadley was relieved by the appearance of her husband. She had done all that seemed immediately necessary; and thought it best to take the motherless little boys home with her till their father was more composed. Alas, that time came not! The kindly surgeon and George Hadley attended upon him through the ravings of a brain-fever—and ere the necessary arrangements for the wife's funeral could be completed, he had followed her to the other world.

In a few moments of composure preceding death he recognised his friend; and when his roving eye seemed to ask for his children, the other assured him they were with his Marion, and should be tenderly cared, and, if necessary, provided for. The exhausted father smiled as if satisfied, and closed his eyes in death. The pledge thus given to the dying parent was amply fulfilled. Mr Hadley endeavoured to let the Oswalds' farm, but did not succeed; therefore, as he was unable himself to attend to it, and part of the purchase-money remained unpaid, it relapsed almost into its pristine state. The relatives of the family in Europe were of course informed of what had occurred. Oswald's friends were unable, poor Lucy's were unwilling, to interfere or assist; and the children remained with the Hadleys, whom God continued to prosper and to bless. The two youngest required not long the cares of these compassionate strangers. Inheriting weakly frames, they soon sank to the grave, over which parental tears of anguish were shed by those whose sole original tie had been pity for the desolate and helpless. Richard, the eldest boy, however, grew up a sedate and thoughtful lad; and very early became most helpful to his adopted parents. He was a few years older than their girls; and as Providence had given them no sons, Dick Oswald was to them instead of one. He was indeed even *more*; for to the wellings of devoted love and reverence were added in his breast a tide of overflowing gratitude, that one might soon foretell would probably influence all his future life; and though out of tender respect to the memory of his unfortunate parents he retained their name, yet by others he was much oftener called by that of his benefactors.

Richard had reached his sixteenth year, when, to his great surprise, a letter from his maternal grandfather called him to the country and estate of his ancestors. There appeared so much that was cold-hearted and selfish in this tardy acknowledgment of the orphan lad, that he at first spurned indignantly the unwelcome invitation. Accustomed, however, to school his inclinations to meet the paramount claims of duty a few days of

calm consideration changed or modified the young man's opinions as to his future procedure. He felt as if he had not courage to open the subject to his adopted mother, but with Mr Hadley he then sought a full consultation.

'I think you ought to meet your grandfather's wish, if not obey his mandate,' was the result expressed by the paternal Hadley. 'I am persuaded mercenary motives are likely to have little weight with one brought up simply and industriously as you have been; yet it cannot be overlooked on other accounts, that by the deaths of your uncles you are the hope and heir of your mother's ancient family. As a matter of choice, my opinion of course is yours, since it would lead you to remain with us.' His voice trembled as he felt the pressure of the young man's hand. 'As a matter of duty,' he proceeded, 'doubts arise. Has or has not your grandfather any claims on you? You tenderly cherish your mother's memory—ask yourself how she would have wished you to act?' This latter consideration was ever a sacred point with the youth; it appeared to decide the conflict in his mind, and immediately he so expressed himself.

'Well, then, my dear boy,' concluded his friend, 'we must, however reluctantly, consider this matter settled. Only this remains to be said: if you should not find everything in Britain as you have reason to expect, or if you should ever feel the want of friends, or a congenial home, remember my house and heart, and the hearts of my family, will ever be open to receive you with a glad welcome.' And so terminated this painful interview—equally painful to the well-balanced mind of the excellent Hadley and of the child he had educated with so much care.

The present occurrence was, in truth, a very severe trial to all the inmates of Young Hope Farm. And who can wonder that it was so? The melancholy parting over, and the young man launched abroad into life, we can readily imagine he carried much of 'Young Hope' with him. Manly and energetic, he was not without praiseworthy ambition and ardent curiosity to see the world, and all its novel wonders. Yet still the secret wishes of his spirit were, that after a few years of improvement or of wanderings, he might be permitted to return—as a wearied bird would to its nest—to the peaceful sheltering haven in the western wilderness.

He wrote regularly, though at considerable intervals, to his parted friends: his short epistles contained little but the strongest expressions of gratitude and affectionate remembrance, and almost with each were sent little articles of use or elegance to those he still called his mother and sisters. He had a tutor, and then he went to college; and afterwards he travelled with his aged relative, and thus he wrote to his friend—'Amidst all the puerilities and conventional forms of artificial society, its heartless ceremonial and tiresome etiquette, how often do I find my heart and memory turning to the boundless liberty of the glorious woods—the crystal-like candour, and outspoken tenderness, with all the innocent hilarities and simple enjoyments of my transatlantic home! I am to study for the bar, I believe, as a matter of *status* and *éclat*, and I am to inherit a moderate patrimonial estate. Oh how gladly would I rather assist my father to improve and decorate Young Hope Farm!' And again—'Greatly would I prefer sitting an hour on the lonely grave by our little lake-side in communion with nature, to mixing with the most *recherché* society I have yet seen. And oh how much rather would I read one of your letters, that tell me I am still dear to you, than reap even such academic honours as I have attained to, when I cannot have your voices to add your meed of applause! My grandfather is very kind, and most indulgent: on but one subject are we not congenial. He thinks my heart is too much in my childhood's home. He seems to be seriously in dread that some fine morning he will discover that I have escaped to the woods, like a Red Indian but half reclaimed from

savageism. This, too, may come to pass some day. Keep up your hearts, dear ones, in hopes it may.'

Half a dozen years escaped thus, tedious in their transit, like a dream when they are gone; and then young Oswald's grandfather died. The patrimony that now became Richard's was found to be heavily burdened: for the law, as a profession, he had an unconquerable distaste; and to keep up a hollow show on an inadequate income, was at variance with every sentiment of manly candour and straightforward principle so carefully and early instilled into his breast. Richard Oswald, therefore, immediately entered into negotiations with a cousin who panted to become a landed proprietor and head of the family (and who, indeed, had ever been disposed to consider the former merely an interloper), and from him he accepted an equivalent in cash for his patrimony.

How gladsomely was a letter from the beloved absent one now read and re-read at Young Hope Farm; for it said, in a few thrilling, joyful words, that, his duty performed, his mission accomplished, and himself at liberty, he would now return to devote his life to the friends that had nurtured his orphanage. From that day mighty preparations went on at the farm—preparations intended to welcome the wanderer to his nest again. But weeks and months rolled on, and Richard arrived not. They knew not now how to address him a letter; and hope deferred, began to make sick the longing affectionate hearts. The spring flowers, whose blossoms he had almost promised to greet, were withered; summer was fast brightening into a rich productive harvest; but Young Hope Farm looked cheerless and sad. Not a living thing was to be seen without; no cheerful busy sounds, so usual there, were to be heard, except it might be the birds singing among the trees—those trees which, twenty years before, were planted as mere saplings, now enclosed and concealed the fair home, till it was like a nest indeed, and like nothing so much. The birds, we say, still sang blithely around it: but was there mourning within? Yes: in the inner chamber lay the matron, the mistress of the house, apparently in the last doubtful stage of an acute disease. Her devoted husband sat near her, his face buried in his hands, for she could not recognise even him. Her eldest daughter, most like herself in form and character, supported the sufferer's head, and endeavoured to soothe her restless moanings; while the other, a beautiful girl of seventeen, was altogether overcome, and weeping bitterly. The low casement was partly opened to admit the summer breeze, bearing with it refreshingly the fragrance of woodbine and roses, while it swept the long branches of a graceful acacia against the window-panes, with a caressing-like gesture, throwing shadows as graceful and life-like over the nicely-papered walls of the rooms and the snow-white draperies of the silk couch.

The watchful daughter fancied her mother spoke: she bent her ear to catch the words, and heaved a deep sigh as she heard only 'Richard, Richard!' Yes, many times during the ravings of delirium in the last few days had that name burst with deep pathos or impatient longing from the parched and fevered lips. Richard came not. 'Oh would he but arrive to soothe the last moments, if so it must be!' thought the daughter.

The family were anxiously expecting, too, the arrival of the friendly surgeon, who had been obliged to leave them the day before. He at least now came. They heard his horse's feet; and Mr Hadley was beckoned noiselessly from the room to meet him. Almost immediately he reappeared, and was followed by a *stranger*, who silently gave a brother's kiss to each of the afflicted girls; and ere they could recover their surprise, he was kneeling beside the low couch.

'Mother,' he said, 'my more than mother! am I returned to find you thus?'

She opened her eyes, and again murmured dreamily 'Richard!'

'Richard is come, never more to leave you. Oh mother, live to bless us!'

She looked at him with a sudden, yet faint gleam of intelligence, and then wearily turned her head, as if to rest.

The surgeon, who now entered, drew the young man and the agitated maidens from the room, which was instantly darkened; and the patient slept, happily to awake composed and sensible, the crisis past, and renewed life in prospect. And she has lived since then many happy years, the valued wife, the tender mother, to rejoice over her recovered treasure and reunited family.

The adopted son built a fair and graceful addition to the farm-house, and imparted many elegancies and useful appendages to it and to the flourishing gardens. There he married the eldest daughter, to whom his thoughts had long in secret involuntarily turned. A nephew of Mr Hadley's afterwards joined them from Scotland, and became the husband of the lovely second sister; while a third, yet in childhood, was the cherished darling and plaything of all. So the roof-tree of Young Hope—its owners delight to think that not one of their early hopes has really failed—promises fair to become a flourishing stock, adorned with numerous noble branches and rich fruit. At all events, the fair dwelling now stands in nestling loneliness and loveliness, a heart-stirring ornament of the majestic wilds, an oasis of happy rest, and of anticipations realised; demonstrating—how much more *breathingly* than our poor words may!—what skill and energy, when combined with upright intentions and good feeling, may accomplish amidst the boundless solitudes of the 'far west.'

FLOOR-CLOTH.

It has been remarked, that a people's progress in civilisation and refinement, may be ascertained from the state of their dwellings; and we have no doubt that in general it may. There is a commendable selfishness that prompts men to collect the fruits of their skill and enterprise around them, and make them subservient to their pleasure, so that domestic arrangements generally reflect not a little of individual character and resources. The history of household furniture in Scotland for the three last centuries, would present a pretty accurate picture of the national progress. In the single department of the floor, there has been a gradual ascent from plain mother earth to the elegant Brussels carpet, and scarcely less elegant fabric of which we purpose to speak. The making of *floor*, or, as it is sometimes improperly called, *wax-cloth*, is comparatively of modern date, and like most manufactures, has reached its present state by slow degrees. Of late years the growing demand for it as an elegant and fashionable article of household comfort, gave rise to a few large establishments in England; but the only one of the kind in Scotland, is the 'Scottish Floor-Cloth Manufactory,' of which we purpose giving some account. Beside the importance that attaches to it as a new branch of skill and industry, the operations carried on possess no little interest in themselves.

This work was erected in the summer of 1847, near the populous town of Kirkcaldy, and is by far the largest pile of masonry in the district, forming a conspicuous object from a distance, both to the traveller by railway, and the voyager by sea. It is 160 feet long, 87 feet wide, and 52 feet high, the walls being of corresponding thickness. There are four tiers of windows, 150 in all, mostly what are called 'flake-windows,' for the purpose of ventilation. The principal apartment, which is the drying-room, occupying the main body of the building, contains two rows of immense pillars, reaching from the ground to the roof, for the purpose of supporting cross beams, from which the cloth is suspended when drying. These pillars are entire pines, such as are used for masts, imported direct from Russia. Some idea may be formed of their strength when it is considered, that beside the support given to the roof,

they sustain the weight of 180 or 200 pieces of half a ton each. We were shown over the premises by the enterprising proprietor, Mr Nairn, who kindly explained all the different processes. The original fabric, which the English works mostly import from Scotland, but is here manufactured on the spot, is a coarse flaxen cloth, which is worked by two men in broad looms, being eight yards wide. The cuts of canvas, on being hoisted to an apartment called the 'frame-room,' are stretched on large vertical frames, for the purpose of receiving the ground-paint; but before describing this process, let us look at the preparation of the paint. The materials used are chiefly the ochres and leads, which are thoroughly pulverised by a crushing roller, and then mixed with linseed-oil, and other ingredients suitable to the purpose. To reduce them to a further degree of fineness, they are then poured into a 'hopper,' and ground by a pair of millstones, from which they flow into stone tubs, where they are kept for use. The cloth, having been stretched on the frames already mentioned, which reach from side to side of the building, receives on the back or floor side a coat of size-paint, and is thoroughly rubbed with a large piece of pumice-stone, in order to render it perfectly smooth. The paint is then applied from the tubs with a brush in large daubs, and afterwards spread over the cloth with a long narrow trowel. The process of rubbing with the pumice-stone is repeated, and when the coating is sufficiently dry, another and another is added, according to the desired thickness of the cloth. The consistence of the paint, which is about that of molasses, imparts great strength and durability to the fabric. On the back of the cloth being finished, the face undergoes three or four similar processes, and at last receives what is technically called the 'brush-coat,' to fit it for the ornamental prints of the blocks. As the former coating must be dry before another is applied, these operations usually occupy three or four months. The pieces are then taken down from the frames, and conveyed to the printing gallery, in the opposite end of the building. This is a narrow platform, placed near the roof, and the operations carried on in it are precisely similar to those of common block-printing. At one time a much ruder method was pursued: holes were cut in a piece of pasteboard, in shape of the intended pattern, and the paint applied through them, as is still done in stencilling the walls of rooms; but it always leaves the figure ill-defined, as well as deficient in paint. Blocks were introduced by the late ingenious Mr Nathan Smith of London, and have continued to be used ever since. In the establishment is a designer, whose business it is to devise patterns; and as every work of the kind has one or more of this profession, whose skill and genius are considered its peculiar property, it is always an object not to copy, but to combine as much as possible originality with elegance. The lately-instituted Schools of Design are doing much to supply and improve this department, in which we are still confessedly behind our neighbours across the Channel. The designs are transferred to blocks by the woodcutters of Glasgow; an art that has now attained a high state of perfection, many woodcuts being little inferior to engravings. There are always as many blocks used in printing a piece as there are colours, usually a few more; and as no one must interfere with another, the utmost nicety is required in adjusting them to each other, so as to bring out the pattern correct and entire. It is interesting to observe the printing process, how the design is transferred to the previously-prepared cloth in broken portions, till, from seeming irregularity and confusion, there results a beautiful and well-defined figure. As these operations are concluded, the cloth is drawn from the hands of the printers over the side of the gallery, and hung up in the immense drying-room, formerly described.

The choice of patterns, as in calico-printing, is purely a matter of taste. Each manufacturer exerts his own ingenuity, and avails himself, as far as it can be honour-

ably done, of the ingenuity of others, to produce such designs as will meet public favour. In a manufacture like that of calico, where the demand is extensive, a single happy design has been known to realise a fortune. In floor-cloth, however, the leading patterns are not very numerous; but they are brought out with considerable variety of detail, and a few of them are rich and exquisitely beautiful. They are chiefly granites, marbles, oak panellings, Gothics, and chintz. The marbles exhibit a pleasing variety, in exact imitation of nature; but the three last are the most numerous and diversified. Some specimens of the Gothic, prevailing colours red and green, look very graceful, and are well fitted for long passages and spacious halls; but we were most attracted by a chintz, consisting of two bouquets of flowers, with a variety of drapery interspersed. This expensive cloth has ten different colours, and fourteen blocks were required to bring out the design. The variety of colours and patterns, when the cloths are suspended in the large drying-room, forms a rare and gorgeous sight. It is impossible to examine this work minutely without perceiving that floor-cloth is a much more complicated and expensive manufacture than is generally supposed. Few and simple as the processes may seem, they imply an advanced state of the sciences and arts. Some of the materials used are the products of researches and discoveries that extend over ages, and are still very costly. A small bag of paint, not larger than a steer's bladder, was pointed out to us as having cost L.20. The arts of block-making, designing, and transferring the designs, require a degree of skill and nicety, of which those unacquainted with them can form no conception. This is a condition of almost all modern manufactures; they are raised upon others, without which they could not exist. As with the functions of the human economy, one is necessary to another. We were wont to consider the price of floor-cloth as exorbitant, but our visit to this establishment has materially altered our opinion. Independently of the large outlay on the requisite buildings, most of the labour required is of the most expensive kind; and here, at least, the principal workmen are from the large English houses: but, above all, is the time that must elapse before the manufacturer can obtain a return for his goods. The cloth has to be about ten months in the factory before it is fit to be sent into the market.

OCCASIONAL NOTES.

THE 'SWEDISH-NIGHTINGALE' PEST.

We wish—though entirely with a regard to our own comfort—that Jenny Lind would either marry or take the veil, and so be done with it one way or another. While she remains as she is—a spinster—she is a serious evil, especially in the provinces. There we hear not her sweet strains—except perhaps once or twice altogether, when she has condescended to become a Wandering Voice. In general, our doom is only to hear of her in the London journals; and there we hear too much. Would metropolitan editors only consider that, though it is sport to them to listen to the actual performance of this nightingale, it is death to us to have limitless paragraphs about it! This, however, we could bear, as we bear hundreds of other matters local to London, and which London innocently supposes to be interesting to the whole world of Britain. But this eternal paragraphing about the personal history of the vocalist—this is what we most specially complain of and remonstrate against. That a simple Swedish girl should have proved to be a wonder and a prodigy to a multitude of London English, in as far as she cared little about money or puffery, is nothing to us in the country, who are of much the same unsophisticated character as Miss Lind herself. Their incapability of appreciating her motives, and the pure bewilderment which they experience in consequence, are no doubt very natural to *them*, but exceedingly impertinent to *us*. To them, moreover, the mysteries of theatrical interests

are matters of gossip of vast consequence: but to us, who know nothing about them, they are vapid stuff. The dread of losing a source of entertainment which they alone can enjoy, why should *we* be everlastingly bored with it? Why, above all, should we be condemned to see this delightful specimen of unspoiled and unspoilable humanity badgered through all the newspapers about her wish to retire, her intention to be married, and so forth, as if the sanctity of an individual will were in this case to be held as a compromised right? To us, in the simplicity of the provinces, the whole of this generation of paragraphs about Miss Lind's heart and hand is an utter abomination, which we should be disposed, if in our power, to make very short work in reforming. Since this is not the case, we must return to our first position, and say that, were it quite the same to Miss Lind to become a Mrs Something, and thus cut off the whole troop of Impertinents who at present howl after her, we should feel truly obliged, being thereby exempted from a trouble and a pest which we fear must otherwise continue to vex us for years to come.

PEOPLE'S COLLEGE AT SHEFFIELD.

The word 'college' is associated with ideas of extensive buildings, richly-endowed chairs, and all other 'appliances and means to boot' for the advancement of learning. A People's College, then, would mean an institution of the kind distinguished by popular features, and more especially open to the classes hitherto withheld by want of funds from slaking their intellectual thirst at the more costly fountains. Let us see how the People's College at Sheffield answers to this definition.

When Mechanics' Institutes are arranged for the supposed advantage of those classes for which they were originally intended, the only branches of education taught at them are the rudimental ones—reading, writing, and arithmetic. A mechanic, therefore, after having got over these stepping-stones to knowledge, is thrown upon his own resources. There is no establishment adapted to his means where he can receive instruction in the higher branches of learning; and if he pursues the path of inquiry at all, he must do so at home, and in the midst of many discouragements and interruptions. About seven years ago a gentleman, then an Independent minister in Sheffield, was struck with this imperfection in the educational arrangements of the country; and after a preparatory lecture, he startled the adherents of the old system by opening an institution, which he called the People's College; and in which, besides the instruction usually given to mechanics, were classes for grammar, mathematics, logic, English composition, elocution, &c. besides Greek and Latin, and some modern languages.

This institution was, in point of fact, a private school, the property of the reverend gentleman; and it passed through a variety of vicissitudes incidental to such speculations, during which it was chiefly worked by Mr Bayley in person, assisted by some of the senior students as monitors. It seems, however, in the opinion of the correspondent to whom we are indebted for this information, to have at least proved that the working-classes are by no means indifferent to those higher studies which are usually considered to be beyond their intellectual reach; although this opinion would seem to be somewhat at variance with the fact, that at the close of last summer the number of students amounted only to thirty. At that time Mr Bayley was appointed to a congregation in London, and he bade adieu to Sheffield, leaving the orphaned college to the chances of the world.

Now comes the most interesting part of its history. A meeting of the principal students took place, at which much regret was expressed at the impending fate of the institution, and strong opinions advanced as to its peculiar adaptation for the work of supplying the educational wants of the lower-middle and lower classes. In fine, it was resolved by these somewhat enthusiastic and high-minded persons to continue the college *themselves*; and in so spirited a manner were their exertions responded to by the people, that upwards of one hundred young men and

women at once enrolled their names as members. This was six months ago; and so steady has been the increase, that at the present moment there is a weekly attendance of one hundred and eighty.

Now let our readers observe this, for here lies the great interest of the subject. The college continued, and still continues, to be under the sole direction of twelve students, who were chosen as a committee for the purpose; and so disinterested are the labours of these persons, that they not only devote gratuitously their time and talents to the service of the institution, but they pay the same fee as ordinary scholars—namely, sixpence per week, and one shilling per quarter. This fee is the sole revenue—the college has never received a shilling in the way of donation; and besides these twelve, there has never been more than a single other teacher, a gentleman who is paid for instructing in French and German.

In order to convey a correct idea of the class of society by which this self-supporting and self-governing establishment is carried on, we here indicate the occupations of the teaching and managing committee:—

One master shoemaker.
One steel refiner.
Two brushmakers.
One banker's clerk.
One tailor.
One grinder.
Two fender-makers.
One caster.
One cooper.
One ironmonger.

Of these, all are journeymen, with the exception of the shoemaker and banker's clerk. Our informant is one of the committee, Mr Isaac Jackson, brushmaker; and he concludes his letter thus:—'My only object in sending you this statement is, that you might use your influence to induce the young men and women of other towns to "go and do likewise." What has been done in Sheffield may be done elsewhere.'

The most effective way in which influence can be used in a case of this kind, is simply to give it publicity. We have always stood up for the true dignity and independence of the working-classes; and here is a remarkable exemplification of the resources they possess within their own body. The time has been when a People's College, such as is described above, would have been reckoned the idle dream of an enthusiast; and it would have been so in reality so long as this belief continued. But, in spite of the ill-judged attempts that have been made to persuade the working-men that they can do nothing of themselves—that they are lost without the fostering care of wealth or authority—a healthy conviction would appear to be rising in their minds that they are themselves the arbiters of their own destiny. We trust this may spread, and that our readers will repeat to one another, and to themselves, the words of our correspondent—'What has been done in Sheffield may be done elsewhere!'

SKETCHES IN NATURAL HISTORY.

THE PHOLAS FAMILY.

If any one will go to the sea-coast at no great distance from Edinburgh, with a hammer in his hand, we can promise him a speedy introduction to the *Pholas* family. Finding some rocks of shale or clay, which the ebbing tide just uncovers, let him give a smart rap or two with his hammer at the doors of the pholas mansion, and he will presently see a hundred tiny jets of water pop out of a hundred minute apertures. This will tell him the pholades are at home; but to get at them personally is more difficult, if possible, than to get personal interview with the 'great ones' of another family. Always supposing that the hammer in question is a geologist's, let the sharp end of it be diligently used until a mass of the rock is detached some five or six inches square, which, from the friable nature of these strata, is not very difficult, and he will secure a sufficient number of these animals for the purpose of investigating their

habits and economy. Having got the fragment of rock home, and examined it closely, it will be found perforated by a large number of holes, which lead to canals in its substance. The holes are about the diameter of a quill. On splitting a canal perpendicularly downwards, it will be seen that its direction is for the most part vertical, and that this direction is common to every canal in the mass. Sometimes, however, there is a certain degree of inclination in the direction, a fact, as we shall have to notice further on, of some consequence to the geologist. The canal runs with a perceptible increase of diameter, for five or six inches in some cases, into the stone; in others it is not so deep; and at its extremity is a pear-shaped cavity, the broadest end downwards, and narrowing toward the opening of the canal into it. Snugly ensconced in this cavity lies the terrified and home-invaded subject of our article—the pholas, or, as it is commonly called, the File-fish.

When it is considered that the pholades are so easily come at, and abound in many limestone rocks on our coasts, it is somewhat surprising that so much ignorance should have prevailed, and still exists, about these curious but simple creatures. Many zoologists consider the pholades to belong to the family of bivalve animals; but as, in addition to the two valves characteristic of this class, there are several small supplementary portions which protect the hinge, others consider it belonging properly to the multivalves. It need scarcely be said that these valves are the cases or coverings of the body, resting upon the fleshy mantle which secretes them, and united at the portion called the hinge. The shell, thus formed, is chemically composed of carbonate of lime, and is of the most delicate white colour, and frequently of an elegant form. The shape is oblong, and narrower at one end than at the other. The external surface of the shell of many species is raised into a series of cross-hatched elevations; some proceeding longitudinally, and others transversely; in others, however, the surface of the shell is quite smooth. These two large valves enclose and protect, so far as such a rock-inhabiting creature needs protection, the most important visceral organs of the pholas. But the habits of the creature demand that it should be furnished with some long and pliant instrument, by means of which, although deep-buried in its cell, it may reach the surface of the rock, and bathe in the fresh waves outside. On a clear day, and in calm waters, any one with sharp eyes may detect lolling out of the holes of the rocks, here and there, a curious tubular process, apparently formed by soldering two tubes together laterally, like the barrels of a fowling-piece. This is called the 'tube' of the pholas, and is evidently intended to supply the imprisoned creature with food and fresh water for respiration,* under the active assistance of the numerous cilia of the creature. This organ is possessed of a certain measure of retractile and contractile motion for the performance of its functions; by virtue of the latter, squirting out the jet of water which formed our introduction to the animal. It is stated by some observers, that the creature is constantly sucking in and ejecting water through the tube; but with what degree of accuracy we have not had the opportunity of ascertaining. At the broad extremity of the shell, the powerful muscular organ called 'the foot' is situated; by means of which, applying itself closely to the rock, the pholas obtains a firm fulcrum and point of attachment. The pholades derive the whole sum of their nourishment from the water, most probably from minute animalcules floating therein: on this, as we should say thin, and doubtless watery diet, they live, thrive, and grow fat, being conspicuous exceptions to the general rule in the case of such rigid hermits. Being incapable of motion, the young pholades are dropped from the tube of the parent on the surface of their native rock. Having thus briefly mentioned the organisation and peculiarities of

* Vide 'Ciliary Motion,' under Popular Information on Science, in No. 128.

these creatures, we may relieve the possible tedium of pure description by adverting now to that interesting part of their history—their terebrating or perforating powers.

Although the pholades are most commonly to be found imbedded in limestone rocks, or in marly strata, they are by no means exclusively confined to such habitats; since there are some which perforate wood of the hardest description, and have also been found in lava, trap, and sandstone rocks. The young pholas, thus cast out upon the tender mercies of a rough world, without a protector, and without a home, with a tender delicate body, and a stubborn rock for its couch, and in addition, exposed to all the fury of a raging tide or boisterous surf, is in a condition which demands amazing stoutness of heart and energy of purpose. The supply is equal to the demand; for the little creature soon sets about its work, and in a little while has produced a sensible impression on its bed of stone: this deepens into a hole; and at length, by dint of unrelenting perseverance, the rock-cell is formed, and the molluscous hermit dwells therein at ease, as the fruit of his labours. In what manner this operation is commenced no one appears to have determined, although the ingenious Oliver Goldsmith, in his usual easy way of getting over difficulties, says: 'The instrument with which it performs all its operations, and buries itself in the hardest rock, is only a broad fleshy substance somewhat resembling a tongue, which is seen issuing from the bottom of the shell. With this soft and yielding instrument it perforates the most solid marbles; and having, while yet little and young, made its way by a very narrow entrance into the substance of the stone, it then begins to grow bigger, and thus to enlarge its apartment.' Rejecting, however, this very plausible hypothesis, it is interesting to inquire upon what grounds zoologists have endeavoured to explain the process by which this feeble animal effects its entry into the obdurate surface of the rock. Probably upon few subjects in natural history does so much discrepancy of opinion still exist; and when the abundance of subjects every coast presents for our investigation is considered, it looks something like an opprobrium to the science that the question remains now just where it was forty or fifty years ago. The slowness of the process is probably the real difficulty in the investigation; but surely a little patience would not be misspent in settling the point? The opposing theories may be classified under the two denominations, the mechanical and the chemical. M. Reaumur, that all-intelligent observer, was early attracted to this subject; and in an interesting paper communicated to the French Academy, he supposes that it is effected by a muscular action of the foot, and that the creatures entered the rock when it was in a soft condition. The latter part of this suggestion is undoubtedly erroneous, as the pholades perforate rocks which were only soft when at an intense heat at some far-distant time; such as trap and lava. The ingenious Mr Gray of the British Museum, in a communication contained in the 'Zoological Journal,' believes that by means of the 'foot' the pholades obtain a firm attachment to the rock, and perforate it by a sort of rasping process, effected by a semi-rotatory motion of the valves of the shell. Mr Stark considered the subject deserving the attention even of the Royal Society of Edinburgh; and in a paper read before that learned body, he states that, from repeated examination of the recent animals, he felt no hesitation in asserting that two species at least form their holes by rotating and rasping the stone with their valves. In confirmation of these gentlemen's opinion, it is said that circular lines are distinctly visible in the cell of the animal corresponding to the elevated striae of the shell; presenting the appearance as if the boring had been effected by an auger; and in some of the cells scooped out in wood, this appearance is very striking. Toward the upper part of the canal these marks have disappeared, in consequence of the continued friction of the fleshy tube in its motions in that part of the cavity.

A formidable argument is wielded by a host of unreasonable opponents, who say that this cannot be the right explanation, because several species of terebrating pholades have *smooth shells*. On the other side, this is met by calling to remembrance the constancy of the operation; and little is known as to the length of time which may elapse while these patient miners labour out their deepening cell! 'A drop of water wears away stones;' or, in the elegant language of one of these side advocates, the keys of the pianoforte are hollowed by 'the softest touch of the softest fingers.' And it is always to be remembered, that the constant presence of water must facilitate the operation. At the meeting of the British Association at Plymouth, this question was brought forward, and elicited, as usual, the observations of a numerous party on either side. Professor Owen, with all the weight attaching to his authority, considered the holes were produced by the incessant action of the cilia of the creature producing currents of water, which in process of time wore away the rock. But Dr Buckland replied by saying, that if that were the case, the cavities would be largest at their openings, where greatest force would be exerted; and he rather inclined to believe that the creature, by virtue of some acid secretion, softened the rock, and then produced the cavity by rasping away the softened parts by the rotation of its shell. And Mr Phillips followed on the same side, saying that the regularity of the holes proved that they were made by the motion of the shell, and not by currents of water. Sir H. de la Beche thought it probable that the carbonic acid evolved in the respiration of the animal softened the material of the rock, and assisted in its disintegration. Were it not that M. de Blainville declares, that on a careful examination he could detect no trace of acid in the secretions of the pholas, we should be disposed to agree with the mechanico-chemical theorists, and say that the perforations were the effect of the joint agency of these two causes; and if we accept Sir H. de la Beche's suggestion, the same supposition may still be the correct one.

When such 'learned Thebans' contend so ardently between themselves, we may well retire from the field, and turn, as it is best to do in all similar cases, rather to the established effects than to the litigated causes. Insignificant as it may seem, the pholas is the cause of great anxiety to man, with regard to the stability and permanence of his submarine undertakings. These tiny galleries and mines, multiplying by thousands, and attacking a large surface, at once may commit the most extensive damage, and lay the foundation of a train of events which may one day bring down to ruin the proudest monuments of human skill. The Breakwater at Plymouth was soon attacked by them, and the unseen mischief which they are now effecting there cannot be rightly estimated. Not only do they attack stone structures beneath the wave, but wooden piers of the most solid construction suffer equally; and the only remedy against their invasion, is to drive a multitude of nails into the timber, so as to render it impossible for the creatures to effect an entrance. Their ravages on the rocks of different portions of our coast, produce a magnitude of results which, when compared with the minuteness of the agents, is something surprising. The coast near Edinburgh is formed by alternating and parallel strata of shale and sandstone. The pholades have long taken up their dwelling in the shale, and have so honey-combed it in every place, that it has become rapidly disintegrated and washed away; while the sandstone remains, only rounded by the influence of time and tide. Those who are acquainted with Mr Lyell's valuable work on 'Geology,' will remember that the frontispiece is a view of the temple of Serapis at Puteoli. At a certain height, the pillars present a completely worm-eaten appearance; while above and below they remain uninjured. It is quite evident this is not the work of design; and it has been supposed to be accounted for by the former subsidence of the land beneath the waters, when the pillars became exposed to the attacks of the

pholades, and its subsequent elevation above the surface, when these invaders perished. A similar occurrence appears to be testified by the present condition of the limestone rocks at Plymouth. Many of them are far above the highest tide-mark, yet are found penetrated by holes, undoubtedly the cells of former generations of pholades. Lower down, the shells of these creatures still remain; and at the water's edge are to be found the animals alive. Thus these perforations are often of the greatest value to the geologist, in enabling him to determine the former height of land. And, as was formerly mentioned, the inclination of the perforations, which are generally vertical, may afford him some clue as to whether any alterations have taken place, in the lapse of ages, in the arrangement and disposition of the strata. The destruction they cause is greatly accelerated by the large amount of surface these innumerable holes afford to the destructive energies of the atmosphere and water; and thus where the smooth surface of the rock might have suffered but little degradation by the lapse of a considerable space of time, these little excavators greatly help forward the process, and become most important agents in the formation of fresh strata out of the ruins of the old ones. Yet the creature means not so: in imuring itself in the rock, it is obeying the impulse of a Divinely-inspired instinct, which teaches it that its fragile and delicate shell is no sufficient protection against the fury of a boisterous element. Entering into the rock, it is safe alike from howling winds, thundering waters, and prowling enemies. Thus, in Goldsmith's smoothly-turned sentences, 'the pholas lives in darkness, indolence, and plenty. It never removes from the narrow mansion into which it has penetrated; and seems perfectly contented with being enclosed in its own sepulchre. The influx of sea-water that enters by its little gallery satisfies all its wants; and without any other food, it is found to grow from seven to eight inches long, and thick in proportion.'

It may be poetical to imagine the pholas thus spending a long existence in the obscurity of an undissipated night; but it is not so in reality. One of the most singular circumstances in their history, is their *phosphorescence*. This property has been long known; it is even mentioned by Pliny. The creature is said to secrete a certain luminiferous fluid, which causes everything on which it falls to shine with a pale phosphorescence. M. de Blainville says, that the pholades are the most luminous of all molluscous animals; and he even relates that those who eat the animal raw, in the dark appear in a most awe-inspiring fashion to be breathing flames! This phosphorescent quality is most powerful the fresher the animal is; disappearing if dried, and reviving, it is said, by the addition of a little salt water. The cheering beams of the solar ray cannot light this patient miner to its work, nor penetrate to the confines of its cell; but the Creator has given it a 'light in its dwelling,' wholly independent of the great source of light to the world around; and this pale, gentle, lambent flame makes, what otherwise would have been a dismal, gloomy cave, a light and cheerful home throughout the long years of the creature's existence.

We have mentioned the pholades as the enemies of man in some respects; we may, in conclusion, advert to a different and more agreeable relation in which they stand towards him. At the tables of some epicures these creatures are considered as a great delicacy. The Romans, who, as Dr Adam tells us, were particularly fond of shell-fish, bringing them all the way from Britain to the luxurious city, appear to have set an edible value upon the pholades. M. Desmarest, to the great annoyance of the geologists, has attempted to prove that the celebrated perforations in the temple of Serapis by the pholades, took place, not in consequence of the subsidence of the land, but of the conversion of the temple and its vicinity into a *fish-pond*! And M. de Blainville aggravates them still more by putting the question, 'Whether the pholades were not put there purposely for the supply of the table?' At the present day they are

largely used as an article of food in France and Italy, and on the coasts of the Mediterranean, where they are abundant. In the neighbourhood of Dieppe, Mr Stark tells us that bands of women and children, each armed with a pickaxe, make a formidable army against the unhappy pholades, who tremble in their rock-citadels as these besiegers approach. By means of the sharp point of this implement, they are able to detach considerable fragments of the rock, and a rich harvest of the molluscs ensues. They are then sent to market, or, deprived of their shells, are used as bait for other fish.

That gem-like phrase, 'sermons in stones,' to use the words of a living poet, has sparkled so long 'upon the finger of Time,' that its brilliance has become somewhat damaged for our purpose. But if inanimate creation can teach lessons of wisdom to man, few, we think, will be disposed to deny that a fragment of perforated rock is more forcibly eloquent upon the subject of perseverance under difficulties, than the most nervous appeals to the mind from the pen or lips of any human philosopher.

MOHAMMED ALI'S EXPEDITION UP THE WHITE NILE.*

It is perhaps some reproach to European enterprise and skill, that one great quarter of the world should still remain in many parts unexplored. Mighty rivers rise we know not where, and flow for hundreds, perhaps thousands of miles, in we know not what direction; while on their banks, and in their vicinity, dwell numerous tribes of men whose very names have not yet met our ears. Long before the birth of history there was a city-building, mummy-making, and tomb-excavating people settled on the Lower Nile; and yet, after the lapse of four or five thousand years, we have not been able to follow up that stream to its source, or to decide whether it falls from the Mountains of the Moon or from the moon itself. Two travellers, penetrating into Africa from different points, are even now, it is said, engaged in attempting to solve the problem; and it cannot be doubted that, however unwilling Old Nile may be to show his head, the perseverance of man will be too strong for him, and dissipate every particle of the mystery in which he has so long delighted to involve his origin.

Once in Upper Nubia, we held a conversation with certain Arabs, who professed to have penetrated far into the interior, and to be well acquainted with the character of the tribes found there. They spoke of them as gentle and hospitable; and as a proof that they fully believed the truth of what they had advanced, offered to accompany us any distance up the river. Various obstacles then concurred to hinder our making the attempt: the Nile was too low to allow of our boats being dragged, without much difficulty, up the dreary length of the second cataract; the Strygians, almost in open revolt, barred the passage across the Desert; and Mohammed Ali's tyranny had irritated the black population, and rendered them inimical to all strangers proceeding under the protection of a firman from him. Still, had the season of the year been favourable, our persuasion is that the attempt, if then made, would have been crowned with success. Our Arabs were bound to us by strong personal attachment; and their natural courage and passion for adventure would have enabled us to face without flinching the dangers of the way.

Mr Werne proceeded up the White River under much more propitious auspices—as far, we mean, as regards safety. The expedition consisted of four *dahabies* from Kálura (vessels with two masts, and cabins about 100 feet long, and 12 to 15 broad, each with two cannon); three *dahabies* from Khartum, one of which had also two cannon; then two *kaiàss* (ships of burthen with

* Expedition to Discover the Sources of the White Nile in the Years 1840-1841. By Ferdinand Werne. From the German, by Charles William O'Reilly. In 2 vols. London: Bentley. 1849.

one mast); and a *sandal* (skiff) for communication. The crews were composed of 250 soldiers (Negroes, Egyptians, and Syrians), and 120 sailors and mariners from Alexandria, Nubia, and the land of Sudan. They set sail from Khartum on the 23d November 1840, and soon reached that imaginary line which constitutes the boundary of the Turkish dominions. On the White, as on the Blue Nile, travellers soon learn to complain of the monotony of the scenery, just as men do when they are descending through the Alps from Switzerland into Italy. The similarity between mountains is as great as the similarity between plains; and you become, therefore, tired of the Alps at least quite as soon as of the Desert. But what by Werne and others is termed monotony, is only in the general aspect; for when you come to note the minuter accidents of the landscape, you cannot fail to discover abundant variety. In a succession of date and other groves, there is a constant vicissitude of light and shade; of expansion and contraction; of closeness and irregular dispersion; and then the rise and fall of the banks, the aspect of the villages, the open ground or forest in the back distance, the sky clouded or bright, and the ever-fluctuating river, now narrowing its dimensions to those of the Rhine or the Thames, and now spreading away in lakes terminating in woods of reeds or gigantic rushes, and suffused with pink or tinted with blue by innumerable varieties of the lotus, suffice to keep alive expectation and the appetite for novelty: add to these the occurrence of new tribes acting as a mysterious link between you and the unknown interior. Bear also in mind that every day brings its chances of strife, its probabilities of danger, its certainty of perplexities, embarrassments, and difficulties, and you have enough to impart vivacity to the tamest imagination.

But in the case of Werne, had external sources of interest failed, there would seem to us to have been always an ample supply of amusement on board. The old Egyptian pasha had apparently caught all the oddities within his reach, and put them on board these exploring arks, to excite the curiosity and multiply the entertainment of each other. There were Turks with Circassian slaves, Kurds from the Alpine regions of Central Asia, full of their wild and primitive superstitions, which they developed in strange stories or legends; Arabs, Nubians, Barabras, Negroes, and, above all, adventurers and vagabonds from France, Germany, and Italy, who had spent half their lives in roaming about the shores of the Mediterranean, persecuted by fortune, and persecuting each other with still more unrelenting malignity. The Frenchmen hated the Italians; and the Germans, not without reason, paid and received the same compliment. Still all was not painful in this motley society: all the more remarkable originals laboured with incessant assiduity, and generally with success, to keep awake the merriment of their companions. Of these the most curious was perhaps Feizulla Capitan, who sought consolation from the ills of life in mending his own breeches, or vest, or cloak. He always sat ready to ward off with his needle the blows of adversity. If the wind slackened, Feizulla stitched; if his crew were lazy or disobedient, he stitched again; and if malaria, or heat, or moisture spread disease through the expedition, he looked solely to the magic little instrument of polished steel for comfort. But time and vicissitude work wonders in the greatest of men. No needlewoman, compelled to make shirts at three-halfpence a piece for advertising houses in the City, ever plied her thimble with more persevering enthusiasm than Feizulla Capitan; yet at length it would not do. His sorrows bore down his needle, and he took to brandy-and-water, or to brandy-neat, as the next best substitute.

The European adventurers, though sometimes equally comic, were much less harmless than Feizulla Capitan. While he was engaged in stitching up rents, they were usually busily employed in making them. Tearing to pieces each other's reputations, scheming, plotting, ma-

neuving, to ingratiate themselves with the Turks, and overreach their Christian companions, if the epithet be not in general a misnomer. Werne has diligently chronicled these achievements of theirs; allowing it at the same time to appear, however, that he was very little more disinterested or amiable than they. Doubtless he had sometimes good reason to complain; as, for example, when Vaissier sold him four sacks of moulded biscuits, with a few good ones at the top to make the cheat pass. We forgave him on that occasion for seizing the iron shod in a boot, a heavy stick four feet long, and sallying forth in search of the culprit; and we are likewise disposed to overlook the fact of his not having pushed him into the Nile, when, meeting in a narrow pathway overhanging that river, he muttered, by way of deprecation, the words 'wife and children;' but for the honour of our western character, we should have preferred that the various instances of meanness, rapacity, and profligacy recorded in Werne's volumes had not taken place in the sight of pagans and Mohammedans.

When men travel through a known country, they often mention names which serve as resting-places for the reader's imagination. In ascending the Lower Nile, for example, you meet with Kahira, and Benesaef, and Manfaloot, and Dendera, and Thebes, and Philea; but after leaving Khartum, the voyagers up the White Stream appeared to be overwhelmed by the endless extension of the same idea. You cross and recross the Nile, you sail through reedy lakes, you see the bed of rain-torrent after rain-torrent, you successively encounter the villages of the Barabras, Denkas, the Shilbuchs, the Keks, the Bundurials, and the Dushoils. But these terms are linked with no associations, and point out no differences to your mind. In vain does the traveller descend to minute details—inform you that the banks to-day were higher or lower by a foot than yesterday; that the river turned now towards the east, and now towards the west; that its rate of flowing was sometimes three, and sometimes four miles an hour: you long to push on rapidly towards the mountains, where the stream has its perhaps fabulous cradle.

Yet, by the way, you like to hear a little of the Keks, &c.; and therefore Mr Werne, digressing a little from south-south-west and south-south-east, which is his stock topic when he aims at being eloquent, makes a descent upon the shore, and favours us with a few particulars respecting the people. The following is a favourable specimen of this sort of information:—

'A young woman was so enraptured at the sight of my glass beads, that she wanted to sell me her child, which she carried in a skin under her left arm, as if in a bag. I do not think that I am mistaken with regard to this offer, although one ought not to be confident that the daughter of a harmless nation like the Keks would do so. Perhaps she was a prisoner, which might be the case here generally, and that these women are watched by the men. It is always possible that the men take their favourite wives with them for comfort's sake, and leave the others at home, or put them in some kind of bodily restraint.

'A very large and broad surtuk caught my eye, and I was curious to find out the species of wood of which it was built; but the bulls, standing close to each other there, pointed their horns at me. Two natives sprang nimbly to them, in order to quiet them, whereupon I went off as quickly as possible; and the more so, because last year a soldier had been gored to death. A village bull towered above all of them. His high horns were adorned with two animals' tails; he had also ornaments around his neck. I was not able, however, to examine these ornaments very closely; for he rushed too quickly into the herd, that he might, like all the other beasts, stick his nose as quickly as possible into the smoke. This is a ludicrous sight. Every beast appears to know exactly his heap, or rather his neighbourhood, else an uncommon confusion would take place; for they have their stakes very close to one another.'

Having escaped being gored by the village bull, Mr

Werne, falling from Scylla into Charybdis, gets into awkward proximity to twenty crocodiles. He is ill and weak, and one should say, hardly worth eating; yet the crocodiles were of a different opinion; and no sooner scented his Teutonic flesh, than they began to put their noses and their tails in motion, each for the selfish purpose of taking the first bite. But we must allow him to tell the story in his own way:—'I have fortunately overcome a violent attack of illness which overtook me yesterday evening. Such a faintness seized me in my excursion yesterday that I was obliged to sit down. I slept or lay in a swoon, I know not which. I awoke when it was already dark. A shot was fired near me: I tried to answer; but my gun flashed in the pan; for I had fired it off in a half-unconscious state to call for assistance. I dragged myself in the direction of the spot, and worked through the bushes to the shore, in order to walk more comfortably on the sand. At last I had the stream before me. On my left I saw the fires near the ships; but I was suddenly struck with terror, for there was the horrible sight of more than twenty crocodiles a few paces before me on the light sand! I had really commenced to count the beasts; but did not, however, remain long in *bivio herculis*, for they began to move, scenting human flesh. I hastened back into the bushes, plunged into the holes hollowed out by water which I had previously tried to avoid, and arrived without any accident close to the ships. I heard voices behind me, and recognised my servants, who were in search of me. They were mourning, and reproaching themselves for having left me. Sale set up a loud howl, because he thought I was devoured by the crocodiles. They found me on the ground; they had also been pursued by the beasts. What a poor creature a sick man is!'

Most persons who have ever known the Turks will read without surprise almost any illustration of their cool inhumanity; yet even these perhaps will experience some astonishment at reading how, without provocation, they shot down a number of the harmless natives: the sorrow of whose relatives is thus described by Werne:—'We sailed away with the wind favouring our criminal action, for our men had again come on board before the firing commenced. . . . The natives were hastening towards it; but they did not trust themselves near us. Yet they knew not the melancholy truth that our shots would hit at a distance. Hitherto they feared only the thunder and lightning of them, as we had seen several times. We halted a moment; the unhappy creatures or relatives of the slain came closer to the border of the shore, laid their hands flat together, raised them above their head, slid upon their knees nearer to us, and sprang again high in the air, with their compressed hands stretched aloft, as if to invoke the pity of Heaven, and to implore mercy of us. A slim young man was so conspicuous by his passionate grief that it cut to my heart; and our barbarians laughed with all their might. This unbounded attachment to one another, and the circumstance that that woman, in spite of the danger so close at hand, sought for the man of her heart among those who had perished, affected me exceedingly; because such moral intrinsic worth, flowing from pure natural hearts, is unfortunately more acquired than innate in civilised nations. We had only advanced a little on our way, when above thirty unarmed natives, who must yet at all events have been informed of the tragical incident that had just occurred, sat down on the sand directly close to the river, without suspicion, or designing any harm to us, as if nothing had taken place. And really I had enough to do to prevent their being shot at.'

After this incident, it was not unnatural that the Turks should entertain suspicions of the designs of the natives: they could not help feeling conscious that they deserved to be viewed with detestation, and looked for a display of treachery and cruelty similar to their own. Having reached a natural obstruction in the stream, which, however, would have been none at the period of the

inundation, they began seriously to think of their return; and Mr Werne describes the collected circumstances which determined them in the following passage:—'Nature has drawn here a real bar of rocks through the White Stream, which we dare not venture to surmount; for the water has fallen for some days, as is quite evident, and the vessels could only, by taking out all their freight, pass the defile near the large rocks, which is called on this account Bab-agate. The river-bed beginning from hence appears to be generally of a more rocky nature; for we perceive, even from the rocks on the island of Ishanker, breakers in the stream up the river. However, there is no doubt that we might sail away victoriously over these obstacles at the time of the inundation, for the river here rises to about eighteen feet high. The main thing would be, then, for north winds to blow exactly at this period strong enough to withstand the pressure of water rising in this mountain land; for I am still of opinion that the rapidity of the current increases from hence in such a manner, that we could not advance by the rope even with the best will. We have remained here at the island three entire days, and the *ne plus ultra* is not so much inscribed on the pillars of Hercules in the water, as desired in the hearts of the whole expedition.'

'The war-dance which the blacks performed yesterday has contributed certainly to the final determination to return. Even I thought yesterday that I heard and saw in the fearful battle-song a declaration of war, and a challenge to the contest. It was almost impossible to persuade one's self that it was merely a mark of honour. The natives marched up and down the island in columns, brandishing their lances in the air; sung their war-songs with threatening countenances and dreadful gestures; then fell into still greater ecstasy, ran up and down, and roared their martial chant. Nevertheless I altered my opinion that this was done with hostile views, for the native interpreters remained quietly with us on board the vessel; and when we sent them to request that this honour might not be paid to us, they returned, though not having effected their object.'

'It was thought advisable that we should leave the shore, for the natives had only need to have sprung down to be on board our vessels. There were certainly too many black people; and a warlike rapacious enthusiasm might easily, it was true, possess their minds, influenced as they were by the military manœuvres. It was well, therefore, that a reiterated request on our side was answered, and an end put to the warlike ceremony without our having betrayed our fear by pushing off from the shore. . . . Selim Capitan was really inclined to explore the ascent; but this continuation of the voyage was not to last longer than a day. But when he knelt this morning on his carpet before sunrise, directing his face to the East for prayer, and discerned the numerous fires on the right shore, which he had not remarked during his ablutions, he looked at me so mournfully and suspiciously that I could scarcely restrain my laughter. He concluded his prayer; and now he saw also, on the island Ishanker near us, a number of such little straw fires, over which the naked people were warming themselves, whilst nearly every single man was stretching out his long legs over his own little fire. Then his courage sank anew, for there were still more blacks than yesterday.'

'These men, however, did not come empty-handed, and barter rose to a pitch of greatness and variety such as we had not before seen: a quantity of fowls, goats, sheep, cows, and calves, wood, ferruginous sand, and iron dross, tobacco, pipes, sunsim durra, weapons, all kinds of ornaments for the body—everything for beads. Nevertheless the good Ethiopians did not show themselves to-day quite blameless, for they sold quivers full of arrows, many of which were without points. They delivered the wares while receiving the beads; or the seller ran hastily away, retaining the goods as well as the purchase-money. They cuffed and wrestled with

our men, without, however, making use of their weapons. On the whole, however, the injustice was on our side; the drum, therefore, beat to recall the crew to the vessels.

'It was the middle of the day, about two o'clock, when Selim Capitan, in order to take his leave, and to employ the dreaded people at the moment of our departure, and keep them far from us, threw ten cups of sug-sug on shore; and the cannons on all the vessels were discharged, to bid solemn farewell with twenty-one shots to the beautiful country which must contain so many more interesting materials.'

They were at this time something less than five degrees from the equator; and considering the nature of the stream throughout the whole northern portion of its course, we may infer that if its channel tend southward, the sources of the White Nile may be beyond the equinoctial line. The stream was still large, and the navigation of it beyond the rocks apparently quite practicable. But it may beyond that point be fed by numerous tributaries, which would enable us to account for its great volume of the much shorter course. All this, however, remains in doubt; though, as we have already observed, there is some probability that the veil may ere long be lifted from the fountains of the Nile.

RAMBLES OF AN OBJECTLESS MAN.

'HAPPY are they who find their bread ready baked,' is a proverb which often recurs to the thoughts of those who have the trouble of baking it for themselves. But, as Sancho would say, 'every one knows best where his own shoe pinches him,' and my misfortune consists in having that very abundance for which so many others pine.

I am one of those who may be said to enjoy a life of easy competence. As there is no reason why I should work, I do *not* work; as no one opposes my will, I may be said to have no will; in short, I am losing all appetite for enjoyment of every description; and I am really ill, seriously ill: even my physician is ready to allow it. He tells me to amuse myself; but this is more easily said than done: he orders me to walk; I obey him; but *ennui* follows me everywhere. I am as weary of the parks and the West End, as of the bustling City. I find it as difficult to suppress a yawn at a fancy ball, as when seated at my own chimney-corner, or my friend's fireside. As to the parks, I go there but seldom. I feel mortified at not having a handsome tilbury, or a prancing horse; neither of which, if I had them, would, after all, afford me any real gratification. I am made unhappy by seeing others enjoy luxuries which I cannot afford. *Enjoy!* did I say? Perhaps, after all, they *enjoy* them not. They are envied by pedestrians, that is all; and yet the sight of even this poor satisfaction is irksome to me. To-day, however, for a wonder, my walk was sufficiently agreeable to make me wish to remember it. It enabled me to pass two hours in blissful oblivion of my fits of indigestion, my aching head, and the leaden pace of time. A bright thought struck me—I will write the history of my walk, and this will enable me to pass one more hour without *ennui*.

I went out, as I had done day after day, weary of being at home, without feeling a wish to be anywhere else. I turned my steps, with a sort of mechanical indifference, towards Hyde Park. It was a dull April day; the atmosphere was neither hot nor cold: all around me looked gloomy and uninviting. Still I strolled on, not knowing what else to do, till I reached a spot which was the resort of numerous pedestrians, workmen lounging away their hour of repose, women, old men, and children. I leant against a tree, and stood silently observing the scene before me. There were a number of children belonging to the poorer classes, playing about under the eye of their mothers, or perhaps under that of a grandfather or grandam, proud of their little charge; whilst, mingled here and there amongst them were groups of high-born children, handsomely dressed, and attended

by their nursery-maids. I could not help asking myself the question, 'Which are the happiest?'

My attention was quickly arrested by two of the loveliest and most tastefully-dressed children I had ever seen. It was impossible for the eye not to rest with pleasure on their graceful forms, rosy cheeks, fair blue eyes, and cherry lips. A *lady* might be able to describe more particularly their costumes of richly-brodered cashmere pelisses, and beaver hats with waving plumes—but the charm of the *ensemble* was enough for me; and I could not take my eyes off these little embryo dandies, the eldest of whom seemed barely five years of age. They were throwing from one to the other, with the most imperturbable gravity, a ball, which continually missed its aim, and rolled upon the ground. It was picked up each time by the little boy whose turn it was next to throw it; and the brilliant ball of gold and blue was thus passed backwards and forwards with as much cool gravity as if they had been two old ambassadors exchanging their credentials. The only variety which occurred to enliven the monotony of the game, was the care with which the elder of the two—who, I suspect, was the owner of the toy—wiped off the dust from the glittering plaything with his little white hand, which he took care each time duly to rub in his nurse's apron, and then returned to his game with the most stoical indifference.

As I stood contemplating these beautiful children, my attention was suddenly arrested by a very different object. A ragged, chubby-cheeked boy sprung forward with a cry of delight, and knelt upon the grass by the two young players. His features were irregular and strongly marked, his shoulders high, and his well-worn fustian garments hung clumsily about him. The newcomer clapped his hands, and laughed for joy: his large eyes sparkled with delight. The sedate, high-born boys, the brilliant ball, seem to exist only for him. Each time that it bounds towards the side where he kneels, he bends forward in wondering admiration; but still he ventures not to touch, hardly even to *breathe* upon it. The young players, without deigning to bestow upon him more than a passing look, take up their toy carelessly from his side—the game recommences, and with it his transports of joy. No one, however, invites him to take his turn in playing with this beautiful ball. No one, in exchange for his joyous sympathy, offers him the smallest share of the pleasure which they were themselves so listlessly enjoying. Each kept that which was his own: the poor boy his superabounding delight; the two others their plaything and their dignity. Whilst I remained a passive looker-on at this scene, that verse of the Gospel, 'To him that hath shall more be given, and from him that hath not shall be taken away even that which he *seemeth* to have,' came forcibly to my mind. It seemed to me that this joyous-hearted little fellow, with his well-patched clothes and beaming countenance, was an exemplification of this truth. I know not what irresistible folly possessed me, but I felt a sudden desire to give a plaything to this child, who certainly did not need one—he who took so much delight in only seeing the playthings of others.

'I traversed the park in haste, not indeed without some misgivings that I was perhaps creating an artificial want, and helping to mar an unsophisticated happiness. But it so seldom happens that I feel *any* impulse to action, that I have not the courage to resist one when it is thrown in my way. I hastened to the nearest toy-shop, and purchased a small wheelbarrow, thinking it very possible that the infantile enthusiasm of my young protégé for the glittering ball might already have expended itself. I could not help enjoying prospectively the delight of my ragged friend. But, alas! on my return the whole group had disappeared: the two little boys, their smart nurses, and the joyous looker-on, all had vanished from the scene; neither could I any longer discover on the empty benches the pale and sickly-looking woman whom I had supposed

to be the mother of the poor boy. I explored every avenue, and looked at every ragged child; but all in vain.

I soon found, however, that I, or rather the toy I carried, had become the object of universal attention, and that I was followed with longing eyes by every little ragamuffin in the park. Whenever I appeared, I heard echoed on every side of me, 'The wheelbarrow!—there is the gentleman—the gentleman with the wheelbarrow!' After a quarter of an hour spent in a fruitless search, I turned my steps towards my solitary home, grievously disappointed. I felt also somewhat embarrassed by my purchase, and not a little discomposed at hearing myself called by every group of children whom I passed, 'The gentleman with the wheelbarrow.' As I thus pursued my way, doing my best to conceal my toy, I overtook an old man carrying on his back a little girl, warmly wrapped in a fur cape, which in its days of pristine freshness had doubtless borne the name of ermine; but to which time—the unveiler of still more important secrets—had restored the appearance and the name of cat-skin. The old man leant with one hand upon his stick, whilst in the other he held a wind-instrument, whether a clarionet or bassoon I know not, for my eyes were fixed upon the child whom he carried on his back. The moment the poor wandering musician stopped, the little creature glided into his arms, and was gently deposited on the ground. I then discovered a pair of crutches which formed her only support: she was a perfect cripple.

The poor father had stopped at the steps of a hall-door, and was seeking with gentle care to seat his unfortunate little charge as comfortably as he could, when I approached them. 'Here,' said I, 'this is for her. You will be able to seat your child more comfortably there than on the cold pavement.'

I am no poet, and such one *ought* to be in order to give the most remote idea of the transports which the poor little sufferer manifested on receiving this unexpected gift. Her eyes danced with delight as she exclaimed eagerly, 'For me!—for me!' She dropped her crutches; and, seeming inspired with new vigour by the excitement of the moment, pushed it before her for a few yards.

'You do not thank the gentleman,' said her father gently. She let go the wheelbarrow, raised towards me her sparkling eyes, and with an expression of grateful pleasure which I shall not readily forget, kissed her little hand to me over and over again. Never did any expression of gratitude so touch my heart as that of this little cripple: never can I forget the tone in which she exclaimed, 'For me!—for me!' As I entered my own door, I met an old college-companion, to whom I related this little incident. He asked me coldly, 'Whether the little girl were pretty?' Where shall we find a face which is *not* pretty when it beams with grateful joy?

For the first time during many a long year I passed this day without *ennui*; and during my walk I learned this one important lesson—that as the luminaries of heaven reflect from one to another their light and heat, even so it is that one human heart must reflect upon the other the genial glow of happiness and joy.

FRESH AIR.

Man acts strangely. Although a current of fresh air is the very life of his lungs, he seems indefatigable in the exercise of his inventive powers to deprive himself of this heavenly blessing. Thus he carefully closes every cranny of his bedchamber against its entrance, and he prefers that his lungs should receive the mixed effluvium from his cellar and larder, and from a patent little modern aquarius, in lieu of it. Why should man be so terrified at the admission of night air into any of his apartments? It is nature's everflowing current, and never carries the destroying angel with it. See how soundly the delicate little wren and tender robin sleep under its full and immediate influence, and how fresh and vigorous and joyous they rise amid the sur-

rounding dew-drops of the morning. Although exposed all night long to the air of heaven, their lungs are never out of order, and this we know by the daily repetition of their song. Look at the newly-born hare, without any nest to go to. It lives and thrives, and becomes strong and playful, under the unmitigated inclemency of the falling dews of night. I have here a fine male turkey, full eight years old, and he has not passed a single night in shelter. He roosts in a cherry-tree, and always is in prime health the year throughout. Three dunghill fowls, preferring this cherry-tree to the warm perches in the hen-house, took up their airy quarters with him early in October, and have never gone to any other roosting-place. The cow and the horse sleep safely on the cold damp ground, and the roebuck lies down to rest in the heather, on the dewy mountain's top. I myself can sleep all night long, bareheaded, under the full moon's watery beams, without any fear of danger, and pass the day in wet shoes without catching cold. Coughs and colds are generally caught in the transition from an overheated room to a cold apartment; but there would be no danger in this movement if ventilation were properly attended to—a precaution little thought of now-a-days.—*Waterton's Essays on Natural History.*

MY EEN ARE DIM WI' TEARS.

My een are dim wi' tears, John,
My heart is sair wi' wae,
I lie an' watch the stars, John,
Awearying for the day;
Yet it winna bring me rest, John,
An' it canna bring me peace,
Till the clay is on my breast, John,
An' thoct and feeling cease!

I hae lood ye weel and lang, John,
An' shall while I hae life;
But ye've caused me mony a pang, John,
Wha should hae been your wife,
Though ye never said a word, John,
My trusting heart to win,
Ye hae leed before the Lord, John,
An' that is deeper sin!

Ye're hand leed seeking mine, John,
When naeboddy could see;
An' ye kissed it mony a time, John,
An' wasna that a lee?
An' your een leed looking luve, John,
Whene'er they turned on me;
An' your gifts, what did they pruve, John,
But love—or treachery?

An' your step leed coming here, John,
Sae aft in cauld an' rain,
For mony a happy year, John,
Whase memory is pain!
For I thoct the time would come, John,
When we nae mair would part;
Yet ye gaed without ae word, John,
To ease my breaking heart!

Ye cam' o' your ain will, John,
Ye saw that I was poor;
Ye kenn'd I was nae light o' love:
Ye should hae passed our door.
But I loo ye after a', John,
An' pray to God in heaven,
That I may be ta'en hame, John,
An' your deceit forgiven!

MARY.

PRECAUTIONS AGAINST POISON.

In Germany, to prevent poison being obtained for evil purposes, none is allowed to be sold without a written order or certificate from a physician. To prevent rat-poison being made a bad use of, or taken by mistake, the arsenic is mixed with tallow and lampblack, which makes a compound that no human being could partake of. None is allowed to be sold in a pure state.

KEYF:

THE ORIENTAL CONCEPTION OF ENJOYMENT.

THE idea entertained by the Orientals of pleasure has very little resemblance to ours. When in search of enjoyment we excite ourselves to action, shun solitude and quiet, and surround ourselves with noise and bustle, marvellous and thrilling sounds, colours brilliant and gay, forms of all beauty, everything, in fact, that can strike, and, as it were, irritate the senses: the Orientals, on the contrary, endeavour to relapse into perfect repose. Tranquillity has little charms for us except when we cannot attain it, whereas for them it is the first requisite of happiness. A soft deewan on which to recline, in a half-darkened room by day, and a dimly-lighted kiosk at night, with a cool breeze to fan the air, and the low voice of a singer, or the tinkling notes of some simple instrument at a little distance, rather to mark than to disturb the general stillness; a few grave companions, allowing at long intervals a solemn word or two to escape from amidst the snowy waves of their venerable beards; the soothing pipe, replenished in formal silence by a respectful slave; an occasional 'fingan' of coffee: these are elements of keen enjoyment in the opinion of many a wealthy Muslim, and would not be exchanged for all the gorgeous and giddy amusements which all the capitals of Europe afford. Often, it is true, they are not found sufficient. Differences of age and temperament, varieties of fortune and taste, lead people to look for the same result amidst other impressions. But the state of mind coveted is always a kind of contemplative beatitude, expressed in Arabic by that untranslatable word, 'Keyf.'

It is easier to ridicule than to appreciate this said keyf. Travellers who merely pass through the country have never any opportunities of enjoying it; for it seems to require the preparation of a relaxing climate. Frames braced and invigorated by the keen air of the north are no more fitted to receive this kind of intoxication, than the mind of a grave political economist is capable of experiencing the maniacal excitement into which a howling derwish can throw himself almost at will. The most calm and indolent of Englishmen is restless and uneasy compared with the placid Egyptian in his moments of repose. It was long before I could feel, and therefore before I could understand, the pleasure of sitting huddled up for hour after hour in the same position in the corner of a divan, with a pipe in hand, perfectly indifferent to the flight of time, and perfectly careless of putting the passing moments to profit, exchanging now and then, in a low languid voice, with one or two companions, a brief remark, just sufficient to keep up the communication between us, and escape from the impression of complete solitude.

During the latter part of my residence in the East, I

had begun to relish this sort of thing occasionally, although active pursuits fortunately prevented me from becoming a complete Oriental. I admit the pleasure of such an existence, and can now understand why many Franks, fascinated by its mysterious charm, forget their household gods, and lingering near the banks of the Nile, dream away their whole lives in one continued state of keyf. But it is not the less true that this passion for reverie and unproductive contemplation, indulged in more or less by a whole people, is a great obstacle in the way of its progress; and as long as the doctrine of Fatalism prevails to justify and encourage it, we may expect to see Mohammedan countries continuing in their present backward condition. As I have mentioned this doctrine, I may venture to remark that its pernicious influence in the ordinary affairs of human life has never been accurately estimated. It is certainly true that it sometimes produces great and admirable resignation after overwhelming catastrophes, and co-operates in preventing those violent accesses of despair which are so common with us. Suicide is unknown in Eastern countries, except among slaves. On the other hand, it checks improvement in the arts, and stands in the way of every kind of reform. 'As our fathers did, so do we;' 'what our fathers suffered, that must we suffer;' 'that which is ordained, it would be presumptuous to endeavour to alter.' Such are the arguments by which an Oriental usually meets every proposal of amelioration. Of course, if they were logical, and carried out their doctrine to its utmost consequences, the result would be perfect immobility; but they are not so consistent, and act upon the principle they lay down only so far as to justify their mental indolence. I will add, that in spite of their affected resignation to the decrees of Fate, the natural instincts of man constantly get the upper hand. They seek refuge from those decrees when sickness befalls them, for example, in charms and incantations, as well as in the prescriptions of infidel doctors; but they will not take any means of avoiding disease, except those which are absolutely prescribed in their ritual. They will escape from a house if the roof threaten to fall in; but they will not study to improve their mode of architecture.

I once had a conversation with an Arab, whom I roused from a state of keyf to pester him with argument. I told him that it was criminal to pass so many hours of his life in both bodily and intellectual inaction; and succeeded at length in making him understand my meaning. He at first sought refuge in the pretence that he was elevating his mind by the contemplation of the unity of God; but he soon acknowledged that this was only true in a vague sense, and that he had been in a state of half-unconsciousness, with a few indistinct unconnected images slowly traversing his mind, forgetful

of everything that had passed, and indifferent to everything that was to come. 'You were drunk!' said I. 'No,' said he; 'I was enjoying my keyf.' Whereupon, being perfectly roused, he began to make the apology of this condition, and endeavoured to show that it was the only consolation which man possessed for the evils he suffered in this world. At my observation that most of those evils existed only by man's sufferance, he smiled in pity, and said that all was ordained from above; that we could not modify one tittle the course of events, and had nothing to do but to submit passively, and take every opportunity of relapsing into the unconsciousness of keyf.

The reader has now some idea of the state of mind which the Orientals regard as the highest happiness realisable upon earth. Their modes of producing it are various. Some resort to the dangerous but expeditious method of smoking or eating *hashish*—a preparation of hemp-seed. *Hashishin* (the origin of our word assassin)—that is to say, men who indulge in this practice—are indeed not uncommon in Egypt, where I have known even Europeans occasionally thus degrade themselves. Not long before I left the country, a horrible incident occurred. There had been a party of these unhappy wretches collected in a coffee-house during what is called a *Fantasia*, which may mean either any ordinary amusement, or an orgie. Next morning the shop remained closed after the usual hour. The neighbours assembled, and knocked loudly, but got no answer. At length they burst open the door, and saw twelve bodies stretched on the divans on the floor. Seven were ascertained to be quite dead; two or three more died in the course of the day; whilst the remainder recovered, and related how they had swallowed pastilles containing *hashish*, sold to them by a pedlar from Constantinople. The dose was unusually strong, but was such as the still more depraved Stambouli are accustomed to take.

Another and more vulgar class of men drink *arraki*—a spirit distilled from a variety of substances, but principally from dates. It is sometimes flavoured with mastic, and has not a very unpleasant taste. It is considered to be extremely prejudicial to the health, but is nevertheless swallowed in large quantities by the dancing-girls of all classes, as well as the dancing-boys and the dissipated frequenters of coffee-houses. The consumption of it must be great. It may be procured not only in the cities, but in almost every village of any importance. Almost all donkey-boys, many boatmen, and some servants, will drink spirits if offered to them by Europeans; and I remember a Sherif, or descendant of the Prophet, wearing a green turban, whom we met on the desert coast near the Maâdieh, and who, after refusing to partake of the cup with us before witnesses, came and begged some cognac on the sly, and tossed it off *neat* with great *gusto*. Good wines are enjoyed in private by some wealthy Turks; and Ibrahim Pasha, it is said, was once found dead-drunk with champagne one morning under the sycamore-tree in a public avenue through his own grounds.

The classes I have hitherto mentioned, however, are exceptions to the general rule. The Muslim is, on the whole, very sober, and contents himself with the gentle exhilaration caused by coffee and pipes. The universal use of these stimulants in Egypt becomes less remarkable when we find that, as far as has hitherto been ascertained, they are perfectly innocuous there. I never heard of tobacco producing sickness as in Europe. For my own part, although I could not smoke at all on my arrival, I adopted this necessary accomplishment without the slightest inconvenience. It is almost universal in all Mohammedan countries; although at Siwah, in the Libyan Desert, I found that nearly all the inhabitants abstained, as from a vice. The Wahabis, a fanatical sect of Arabian reformers, prohibit smoking among other luxuries; but I was assured by a native trader, who professed to be familiar with Arabia, that they indulge to excess in coffee, which they never sweeten. He told me that they ground it with stone pestles in large

rude mortars, made of a peculiarly hard stone, and that it often produces in them a complete state of intoxication. 'This is their keyf.' Some of them, he said, smoke in secret; but this was merely an opinion of his own, and indicated that his lax practice was offended by their austerity.

There is one fact connected with smoking which is worth mentioning—namely, that in Ramad'han time, when the whole population fasts from sunrise to sunset, the hoisting of the flag at evening no sooner announces that the fasting time is over, than the ready-filled pipe is snatched up, and a few whiffs are taken, before either hunger or thirst is satisfied. A small cup of coffee succeeds, and then the solid food is devoured. I find it difficult to explain this, because it would appear more natural that, after a long day of hard labour under such privation, an intolerable thirst should exist. Probably habit is more imperious always in its demands than ordinary appetite; and it is not impossible that this practice of smoking, instead of eating and drinking at once, may have some effect in counteracting the evil effects of long abstinence.

I have now mentioned the every-day methods which the Arabs have of obtaining keyf. Collected in groups of two or three, or even alone in a corner, they seem, under the influence of the above stimulant, to be capable of isolating themselves for a time in imagination from the world, and surrounding themselves with agreeable thoughts. There is no nation more prone than they to build castles in the air. They are always making extravagant suppositions—representing themselves, for example, in possession of wonderful wealth or marvellous supernatural powers, by the aid of which they sometimes do the most ordinary things possible.

We were once dropping down one of the placid reaches of the Nile, very indifferent whether our boat advanced or stood still. The sail, lazily swelling, urged us gently along the side of a little island fringed with reeds, that rattled against the panes of our cabin. Over the banks, that shut us in like huge hedges, a few palms rose here and there in the distance, flecking the sky with spots of dark green. The water was steeped in all the brilliance of the heavens; a few aquatic birds stooped gently sometimes along the surface. The crew seemed to feel a sense of inexpressible enjoyment, and one of them producing a *darabukkah* or Arab tambourine, began to beat a tune, whilst another chanted a plaintive love-song; and we listened under the influence of coffee and pipes, and allowed ourselves to be soothed into a perfect state of keyf. Ahmed, our servant, came and sat down on his heels near us with his cup in hand, and after listening devoutly to the end, could not contain his satisfaction. 'No pleasure,' he said, 'was equal to being on the Nile; and 'if he had five millions of guineas,' he would buy a boat, and live for ever in it! We said he might do the thing for much less; but he would not abate one jot of his supposition, and we were obliged to admit the five millions. His plan, at first, was to carry about the whole sum in the hold; but he afterwards consented to invest half of it in some English commercial house of acknowledged stability. He then said that he would procure the most beautiful woman in Egypt as his wife, with an eunuch to watch over her. This addition to his family drew on the necessity of having a second boat as a *harim*; and Ahmed took terrible anticipatory vengeance on every audacious wight who attempted to gain a glimpse of his beloved. We were a long time settling all these matters; and the evening had come tranquilly on in the midst of our speculations. The state of keyf now grew too perfect to allow of our continuing the conference, and relapsing into silence, we watched the red streak, and the yellow streak, and the gray streak, successively disappear, and the stars unfold their petals, and the moon came peering over the bank, revealing five or six ghost-like sails, gliding slowly down in our wake. How long this state continued, and whether reverie was succeeded by slumber, I know not; but a

loud chorus of voices, and the bumping of the boat against other boats, and the grating of its keel on the sandy bottom, and the splashing of the water, and the lights along shore, and, above all, the barking of dogs, told us that we had arrived, as the reader likewise has, without knowing it, at the decayed city of Er-Rashid.

This gives me an opportunity of describing another mode the Orientals have of producing keyf. We landed, and repaired to the coffee-house. It was a spacious building, surrounded by divans and shelves covered with *gozebs* and *shishchs*—two kinds of water-pipe. Some groups were collected here and there watching the game of *tab*; but we soon understood that there was another point of attraction in the neighbourhood, and that most of the idle folks had repaired thither. One of the entrances of the coffee-house led into a broad passage covered with trelliswork, supporting a huge grape-vine, through which the moonbeams worked their way, and fell in bright spots on the stone pavement below. On the opposite side was a kind of kiosk, from which sounds of merriment and laughter proceeded. We repaired thither, and found two or three Turks sitting smoking their pipes in state, whilst a motley crowd of idlers squatted or stood round in a ring. The point of attraction was a poor fellow, deaf and dumb, playing a game with a waggish soldier. The latter held a long piece of cotton-wool in his mouth, and the deaf man was trying to take it from him with his teeth. The various incidents of this contest—the wise looks and rapid movements of the soldier, and the awkward attempts and disappointed whine of the infirm one—seemed to afford infinite amusement to the whole company, most of whom were smoking, or drinking coffee. The principal Turk—no less a person than the governor of Rosetta himself—perceiving two strangers, ordered seats and coffee to be brought to us; a courtesy which we duly acknowledged by laying our hands to our breasts. Our arrival, however, did not interrupt the sport, if sport it can be called, which soon led to some exhibitions of real or affected anger on the part of the actors. We left them in about half an hour; but for some time after could hear from the cabin of our boat, moored close by, occasional exclamations of pleasure and bursts of laughter, which showed that these worthy Muslims were not sensible of the monotony of their amusement.

Exhibitions of dancing-girls were formerly most popular among this keyf-loving people; but the tribe of Ghawazeh has been banished from Lower Egypt; and although many dancing-women are still to be found exercising their calling illicitly in the villages, the inhabitants of the great towns can rarely indulge in such a luxury. The displays of the *khawals*, or dancing-boys, are substituted; and it is only on certain festive occasions that the *awalim*, or female singers, imitate the performances of the Ghawazeh before the women; whilst the men listen to their songs from behind a screen, or through an open window. The accomplishments of the *awalim* do not necessarily include a knowledge of dancing; but since the exile of the Ghawazeh, many of them have emulated the renown of their predecessors.

Singing is very general in the coffee-houses, scarcely one of which is without some professional attendant, who lives on the few para pieces, &c., which the poorest Arab will liberally bestow on whoever contributes to produce his darling state of keyf. Some of these performers have fine voices when young, but their powers do not last for many years. Whether it be from over-exertion at first, or want of cultivation, few seem to acquire a reputation of long-standing. Two or three musicians often accompany the singer, who generally occupies an elevated seat outside the door; whilst the audience not unfrequently nearly fills up the part of the street opposite—all sitting on benches or seats made of palm branches. After a few stanzas, the performer begins to throw his head about as if in a state of ecstacy, his eyes all the while 'in a fine frenzy rolling.' He assists his voice by forming a kind of trumpet with his left

hand half round his mouth. Every now and then the crowd expresses its admiration by ejaculating in a sort of deep chorus the word 'Alláh!' These ejaculations become more and more frequent as the song proceeds, and at length follow hard upon every equivocal, every impassioned expression, every long-drawn and voluptuous quaver. The audience associates itself completely with the enthusiasm of the performer. A collection is usually made at the moment of greatest excitement.

Story-telling is not so common an entertainment as singing, but it prevails to a considerable extent. The romances related are often very amusing, and set off with all kind of picturesque gestures. The reciters are divided into various classes, each of which confines itself to the relation of a particular kind of adventures. It is not common to hear the stories of the 'Thousand-and-One Nights;' but I was present once at the telling of the story of the 'Sage Dúbare' in a coffee-house near the mosque of Abn-l-Abbas at Alexandria. Many Arabs who are not professional possess extensive repositories of tales and anecdotes, which they are fond of relating one to the other; and the incidents are often well put together, and very interesting. However, I will not at present diverge into this subject, having given, I trust, a tolerably correct idea of the mental state which the Egyptians covet above all things, and call 'pleasure,' as well as their various modes of producing it.

EXPERIENCES OF A BARRISTER.

ESTHER MASON.

ABOUT forty years ago, Jabez Woodford, a foreman of shipwrights in the Plymouth dockyard, whilst carelessly crossing one of the transverse beams of a seventy-four gun-ship, building in that arsenal, missed his footing, fell to the bottom of the hold of the huge vessel, and was killed on the spot. He left a widow and one child—a boy seven years of age, of placid, endearing disposition, but weak intellect—almost in a state of destitution. He had been a coarse-tempered, improvident man; and like too many of his class, in those days at least, dissipated the whole of his large earnings in present sensuous indulgence, utterly careless or unmindful of the future. Esther Woodford, who, at the time of her husband's death, scarcely numbered five-and-twenty years, was still a remarkably comely, as well as interesting, gentle-mannered person; and moreover had, for her station in life, received a tolerable education. Her rash, ill-assorted marriage with Woodford had been hastily contracted when she was barely seventeen years of age, in consequence of a jealous pique which she, for some silly reason or other, had conceived regarding Henry Mason, an intelligent, young seafaring man, of fair prospects in life, and frank disposition, with whom she had for some time previously, as the west-country phrase has it, 'kept company,' and who was, moreover, tenderly attached to her. Esther's married life was one long repentance of the rash act; and the severance of the tie which bound her to an ungenial mate—after the subsidence of the natural horror and compassion excited by the sudden and frightful nature of the catastrophe—must have been felt as a most blessed relief. A few weeks afterwards, she accepted an asylum with her brother-in-law, Davies, a market-gardener in the vicinity of Plymouth, where, by persevering industry with her needle, and thrifty helpfulness in her sister's household duties, she endeavoured to compensate her kind-hearted relatives for the support of herself and helpless, half-witted child. Mason she had never seen since the day previous to her marriage; but she knew he was prospering in the busy world, and that, some time before her husband's death, he had been ap-

pointed chief-mate in a first-class merchant-ship trading to the Pacific. He had sailed about a fortnight previous to that event; and now, ten lazy months having slowly floated past, the lover of her youth, with whom, in that last sunny day of her young life—how distant did it seem, viewed through the long intervening vista of days and nights of grief and tears!—she had danced so joyously beneath the flowering chestnut-trees, was once more near her; and it was—oh happiness!—no longer a sin to think of him—no longer a crime to recall and dwell upon the numberless proofs of the deep affection, the strong love, he had once felt for her. *Once felt! Perhaps even now!*—How swiftly had the intelligence communicated by her sympathising sister tinted with bright hues the dark curtain of the future!

'And yet,' murmured poor Esther, the flush of hope fading as suddenly as it had arisen, as with meek sad eyes she glanced at the reflection of her features in the small oval glass suspended above the mantelpiece—'I almost doubt, Susy, dear, if he would recognise me; even if old feelings and old times have not long since faded from his memory'—

'Stuff and trumpery about fading away!' broke in Mrs Davies. 'Henry Mason is the same true-hearted man he was eight years ago; and as a proof that he is, just read this letter, which I promised him to give you. There, don't go falling into a frustration; don't now, Esther, and to-morrow market-day and all! Don't cry, Esther,' she added vehemently, but at the same time sobbing furiously herself, and throwing her arms round her sister's neck: 'but perhaps—perhaps it will do us good, both of us!'

It may be necessary to state that I owe the foregoing particulars to the interest felt by my wife—herself a native of beautiful Devon—in the fortunes of this humble household. Esther was her foster-sister; and it happened that just at this period, it being vacation-time, we were paying a visit to a family in the neighbourhood. A few hours after the receipt of the welcome letter, my wife chanced to call on Esther relative to some fancy-needlework; and on her return, I was of course favoured with very full and florid details of this little bit of cottage romance; the which I, from regard to the reader, have carefully noted down, and as briefly as possible expressed.

We met Henry Mason with his recovered treasure on the following evening; and certainly a more favourable specimen of the vigorous, active, bold-featured, frank-spoken British seaman I never met with. To his comparatively excellent education—for which I understood he was indebted to his mother, a superior woman, who, having fallen from one of the little heights of society, had kept a school at Plymouth—in addition to his correct and temperate habits, he was indebted for the rapid advance—he was but a few months older than Esther—he had obtained in the merchant service. The happiness which beamed upon Esther's face did not appear to be of the exuberant, buoyant character that kindled the ruddy cheek and ran over at the bright, honest eyes of the hardy sailor: there seemed to mingle with it a half-doubting, trembling apprehensiveness; albeit it was not difficult to perceive that, sorrowfully as had passed her noon of prime, an 'Indian summer' of the soul was rising upon her brightened existence, and already with its first faint flushes lighting up her meek, doubting eyes, and pale, changing countenance. Willy, her feeble-minded child, frisked and gambolled by their side; and altogether, a happier group than they would, I fancy, have been difficult to find in all broad England.

The next week they were married; and one of the partners in the firm by which Mason was employed

happening to dine with us on the day of the wedding, the conversation turned for a few minutes on the bridegroom's character and prospects.

'He has the ring of true metal in him,' I remarked; 'and is, I should suppose, a capital seaman?'

'A first-rate one,' replied Mr Roberts. 'Indeed so high is my father's opinion of him, that he intends to confer upon him the command of a fine brig now building for us in the Thames, and intended for the West India trade. He possesses also singular courage and daring. Twice, under very hazardous circumstances, he has successfully risked his life to save men who had fallen overboard. He is altogether a skilful, gallant seaman.'

'Such a man,' observed another of the company, 'might surely have aspired higher than to the hand of Esther Woodford, dove-eyed and interesting as she may be?'

'Perhaps so,' returned Mr Roberts a little curtly; 'though he, it seems, could not have thought so. Indeed it is chiefly of simple-hearted, chivalrous-minded men like Mason that it can be with general truth observed—'

"On revient toujours à ses premiers amours."

The subject then dropped, and it was a considerable time afterwards, and under altogether altered circumstances, when the newly-married couple once more crossed my path in life.

It was about eight months after his marriage—though he had been profitably enough employed in the interim—that Henry Mason, in consequence of the welcome announcement that the new brig was at last ready for her captain and cargo, arrived in London to enter upon his new appointment.

'These lodgings, Esther,' said he, as he was preparing to go out, soon after breakfast, on the morning after his arrival, 'are scarcely the thing; and as I, like you, am a stranger in Cockney-land, I had better consult some of the firm upon the subject before we decide upon permanent ones. In the meantime, you and Willy must mind and keep in doors when I am not with you, or I shall have one or other of you lost in this great wilderness of a city. I shall return in two or three hours. I will order something for dinner as I go along: I have your purse. Good-by: God bless you both.'

Inquiring his way every two or three minutes, Mason presently found himself in the vicinity of Tower Stairs. A scuffle in front of a public-house attracted his attention; and his ready sympathies were in an instant enlisted in behalf of a young sailor, vainly struggling in the grasp of several athletic men, and crying lustily on the gaping bystanders for help. Mason sprang forward, caught one of the assailants by the collar, and hurled him with some violence against the wall. A fierce outcry greeted this audacious interference with gentlemen who, in those good old times, were but executing the law in a remarkably good old manner. Lieutenant Donnaghen, a somewhat celebrated snapper-up of loose mariners, emerged upon the scene; and in a few minutes was enabled to exult in the secure possession of an additional prize in the unfortunate Henry Mason, who, too late, discovered that he had embroiled himself with a *pressgang*! Desperate, frenzied were the efforts he made to extricate himself from the peril in which he had rashly involved himself. In vain! His protestations that he was a mate, a captain, in the merchant service, were unheeded or mocked at.

To all his remonstrances he only got the professional answer—'His majesty wants you, and that is enough; so come along, and no more about it.'

Bruised, exhausted, almost mad, he was borne off in triumph to a boat, into which he was thrust with several others, and swiftly rowed off to a receiving-ship in the river. Even there his assertions and protestations were of no avail. Nothing but an Admiralty order, the officer in command candidly told him, should effect his

liberation. His majesty was in need of seamen; and he was evidently too smart a one to be deprived of the glory of serving his country. 'You must therefore,' concluded the officer, as he turned laughingly upon his heel, 'do as thousands of other fine fellows have been compelled to do—"grin and bear it."' In about three weeks from the date of his impressment Mason found himself serving in the Mediterranean on board the 'Active' frigate, Captain Alexander Gordon, without having been permitted one opportunity of communicating with the shore. This was certainly very sharp, but it was not the less very common practice in those great days of triumphant battles by land and sea.

Very dearly passed the time with the bereaved wife. Her husband had promised to send home something for dinner, and various groceries; yet hour after hour went past, and nothing arrived. Morning flushed into noon, day faded to twilight, and still the well-known and always eager step sounded not upon the stairs! What could have detained him from his wife, shut up, imprisoned, as it were, in that hot, hurrying, stifling city? She feared to listen to the suggestions of her boding heart; and with feverish restlessness ran out upon the landing, and peered over the stairs every time a knock or ring was heard at the street-door. This strange behaviour was, it seems, noticed by the landlady of the lodging-house, and injuriously interpreted. A knock came to the door, and that person entered to know at what time Mrs —, she had forgotten the young woman's name, expected the dinner, she, the landlady, had undertaken to cook.

Esther timidly replied that her husband had promised to return in two or three hours at latest; and that she did not comprehend his continued absence—was indeed quite alarmed about it—

'Your husband!' said the woman, glancing insolently at Esther's figure. 'Are you sure he is your husband?'

The hot blood suffused the temples of the indignant wife as she said, 'This apartment, madam, I believe is mine?'

'Oh, certainly, as long as you can pay for it;' and rudely slamming the door, the landlady departed.

The long wretched night at last over, Esther rose with the light; and after giving her son his breakfast from the remains of that of the day before, set off with him to the place of business of the Messrs Roberts. It was early, and one clerk only had as yet arrived at the office. He informed her that Mr Henry Mason had not been seen, and that the partners were greatly annoyed about it, as his immediate presence was absolutely necessary.

Stunned, terrified, bewildered by the frightful calamity which she believed had befallen her, she felt convinced that her husband had been entrapped and murdered for the sake of the money he had about him: the wretched woman tottered back to her lodgings, and threw herself on the bed in wild despair. What was to be done for food even for her boy? Her husband had not only his pocket-book with him containing his larger money, but had taken her purse! She was alone and penniless in a strange city! The hungry wailings of her witless child towards evening at length aroused her from the stupor of despair into which she had fallen. The miserable resource of pawning occurred to her: she could at least, by pledging a part of her wardrobe, procure sustenance for her child till she could hear from her sister; and with trembling hands she began arranging a bundle of such things as she could best spare, when the landlady abruptly entered the room, with a peremptory demand—as her husband was not returned, and did not appear likely to do so—for a month's rent in advance, that being the term the apartments were engaged for. The tears, entreaties, expostulations of the miserable wife were of no avail. Not one article, the woman declared, should leave her house till her claim was settled. She affected to doubt, perhaps really did so, that Esther was married; and hinted coarsely at an enforcement of the laws against persons who had no

visible means of subsistence. In a paroxysm of despair, the unhappy woman rushed out of the house; and accompanied by her hungry child, again sought the counting-house of the Messrs Roberts. She was now as much too late as she had been too early in the morning: the partners and clerks had gone, and she appears to have been treated with some rudeness by the porter, who was closing the premises when she arrived. Possibly the wildness of her looks, and the incoherence of her speech and manner, produced an impression unfavourable to her. Retracing her steps—penniless, hungry, sick at heart—she thought, as she afterwards declared, that she recognised my wife in one of the numerous ladies seated before the counters of a fashionable shop in one of the busiest thoroughfares. She entered, and not till she approached close to the lady discovered her mistake. She turned despairingly away; when a piece of rich lace, lying apparently unheeded on the counter, met her eye, and a dreadful suggestion crossed her fevered brain: here at least was the means of procuring food for her wailing child. She glanced hastily and fearfully round. No eye, she thought, observed her; and, horror of horrors! a moment afterwards she had concealed the lace beneath her shawl, and with tottering feet was hastily leaving the shop. She had not taken half-a-dozen steps when a heavy hand was laid upon her shoulder, and a voice, as of a serpent hissing in her ear, commanded her to restore the lace she had stolen. Transfixed with shame and terror, she stood rooted to the spot, and the lace fell on the floor.

'Fetch an officer,' said the harsh voice, addressing one of the shopmen.

'No—no—no!' screamed the wretched woman, falling on her knees in wild supplication. 'For my child's sake—in mercy of the innocent babe as yet unborn—pity and forgive me!'

The harsh order was iterated; and Esther Mason, fainting with shame and agony, was conveyed to the prison in Giltspur Street. The next day she was fully committed to Newgate on the capital charge of privately stealing in a shop to the value of five pounds. A few hours after her incarceration within those terrible walls, she was prematurely delivered of a female child.

I have no moral doubt whatever, I never have had, that at the time of the committal of the felonious act, the intellect of Esther Mason was disordered. Any other supposition is inconsistent with the whole tenor of her previous life and character. 'Lead us not into temptation' is indeed the holiest, because the humblest prayer.

Three weeks had elapsed before the first intimation of these events reached me, in a note from the chaplain of Newgate, an excellent, kind-hearted man, to whom Mrs Mason had confided her sad story. I immediately hastened to the prison; and in a long interview with her, elicited the foregoing statement. I readily assured her that all which legal skill could do to extricate her from the awful position in which she stood, the gravity of which I did not affect to conceal, should be done. The offence with which she was charged had supplied the scaffold with numberless victims; and tradesmen were more than ever clamorous for the stern execution of a law which, spite of experience, they still regarded as the only safeguard of their property. My wife was overwhelmed with grief; and in her anxiety to save her unhappy foster-sister, sought, without my knowledge, an interview with the prosecutor, in the hope of inducing him not to press the charge. Her efforts were unavailing. He had suffered much, he said, from such practices, and was 'upon principle' determined to make an example of every offender he could catch. As to the plea that the husband had been forcibly carried off by a pressgang, it was absurd; for what would become of the property of tradesmen if the wife of every sailor so entrapped were to be allowed to plunder shops with impunity? This magnificent reasoning was of course

unanswerable; and the rebuked petitioner abandoned her bootless errand in despair. Messrs Roberts, I should have mentioned, had by some accident discovered the nature of the misfortune which had befallen their officer, and had already made urgent application to the Admiralty for his release.

The Old Bailey sessions did not come on for some time: I, however, took care to secure at once, as I did not myself practise in that court, the highest talent which its bar afforded. Willy, who had been placed in a workhouse by the authorities, we had properly taken care of till he could be restored to his mother; or, in the event of her conviction, to his relatives in Devonshire.

The sessions were at last on: a 'true bill' against Esther Mason for shoplifting, as it was popularly termed, was unhesitatingly found, and with a heavy heart I wended my way to the court to watch the proceedings. A few minutes after I entered, Mr Justice Le Blanc and Mr Baron Wood, who had assisted at an important case of stockjobbing conspiracy, just over, left the bench: the learned recorder being doubtless considered quite equal to the trial of a mere capital charge of theft.

The prisoner was placed in the dock; but try as I might, I could not look at her. It happened to be a calm bright summer day; the air, as if in mockery of those death-sessions, humming with busy, lusty life; so that, sitting with my back to the prisoner, I could, as it were, read her demeanour in the shadow thrown by her figure on the opposite sun-lighted wall. There she stood, during the brief moments which sealed her earthly doom, with downcast eyes and utterly dejected posture; her thin fingers playing mechanically with the flowers and sweet-scented herbs spread scantily before her. The trial was very brief: the evidence, emphatically conclusive, was confidently given, and vainly cross-examined. Nothing remained but an elaborate *ad misericordiam* excusative defence, which had been prepared by me, and which the prisoner begged her counsel might be allowed to read. This was of course refused; the recorder remarking, they might as well allow counsel for felons to address juries, as read defences; and *that*, as every practical man knew, would be utterly subversive of the due administration of justice. The clerk of the court would read the paper, if the prisoner felt too agitated to do so. This was done; and very vilely done. The clerk, I daresay, read as well as he was able; but old, near-sighted, and possessed of anything but a clear enunciation, what could be expected? The defence, so read, produced not the slightest effect either on the court or jury. The recorder briefly commented on the conclusiveness of the evidence for the prosecution; and the jury, in the same brief, business-like manner, returned a verdict of Guilty.

'What have you to say,' demanded the clerk, 'why sentence of death should not be pronounced upon you, according to law?'

The shadow started convulsively as the terrible words fell from the man's lips; and I saw that the suddenly-upraised eyes of the prisoner were fastened on the face of the fearful questioner. The lips, too, appeared to move; but no sound reached my ears.

'Speak, woman,' said the recorder, 'if you have anything to urge before sentence is pronounced.'

I started up, and turning to the prisoner, besought her in hurried accents to speak. 'Remind them of the infant at your breast—your husband'—

'Who is that conferring with the prisoner?' demanded the judge in an angry voice.

I turned, and confronted him with a look as cold and haughty as his own. He did not think proper to pursue the inquiry further; and after muttering something about the necessity of not interrupting the proceedings of the court, again asked the prisoner if she had anything to urge.

'Not for myself—not for my sake,' at last faintly murmured the trembling woman; 'but for that of my

poor dear infant—my poor witless boy! I do not think, sir, I was in my right mind. I was starving. I was friendless. My husband, too, whom you have heard'—She stopped abruptly; a choking sob struggled in her throat; and but for the supporting arm of one of the turnkeys, she would have fallen to the ground.

'Unhappy, guilty woman,' said the recorder, with the coolness of a demon, 'the plea of insanity you would set up is utterly untenable. Your husband, it seems, is serving his majesty in the royal navy; defending his country, whilst his wife was breaking its laws, by the commission of a crime which, but for the stern repression of the law, would sap the foundations of the security of property, and'—

I could endure no more. The atmosphere of the court seemed to stifle me; and I rushed for relief into the open air. Before, however, I had reached the street, a long, piercing scream informed me that the learned judge had done his duty.

No effort was spared during the interval which elapsed previous to the recorder presenting his report to the privy-council—a peculiar privilege at that time attached to the office—to procure a mitigation of the sentence. A petition, setting forth the peculiar circumstances of the case, was carefully prepared; and by the indefatigable exertions of an excellent Quaker gentleman—whom, as he is still alive, and might not choose to have his name blazoned to the world, I will call William Friend—was soon very numerously signed. The prosecutor, however, obstinately refused to attach his name to the document; and the absence of his signature—so strangely did men reason on such matters in those days—would, it was feared, weigh heavily against the success of the petition. The amiable and enlightened Sir Samuel Romilly not only attached his name, but aided us zealously by his advice and influence. In short, nothing was omitted that appeared likely to attain the desired object.

Two days before the petition was to be forwarded to the proper quarter, Henry Mason arrived in England, the exertions of his employers having procured his discharge. The 'Active' was one of Captain Hoste's squadron, which obtained the celebrated victory off Lissa, over the Franco-Venetian fleet commanded by Admiral Dobraudieu. Henry Mason, it appeared by the testimonials of the captain and officers of his ship, had greatly distinguished himself in the action. We enclosed these papers with the petition; and then, having done all in our power, awaited with anxious impatience the result of the recorder's report. It was announced to me, as I was sitting somewhat later than usual at chambers, by Mr William Friend. The judgment to die was confirmed! All our representations had not sufficed to counterbalance the supposed necessity of exhibiting terrible examples of the fate awaiting the perpetrators of an offence said to be greatly on the increase. Excellent William Friend wept like a child as he made the announcement.

There are many persons alive who recollect this horrible tragedy—this national disgrace—this act of gross barbarity on the part of the great personage, who, first having carried off the poor woman's husband, left her to die for an act the very consequence of that robbery. Who among the spectators can ever forget that heartrending scene—the hangman taking the baby from the breast of the wretched creature just before he put her to death! But let us not rake up these terrible reminiscences. Let us hope that the *truly* guilty are forgiven. And let us take consolation from reflecting that this event led the great Romilly to enter on his celebrated career as a reformer of the criminal law.

The remains of Esther Mason were obtained from the Newgate officials, and quietly interred in St Sepulchre's churchyard. A plain slab, with her name only plainly chiselled upon it, was some time afterwards placed above the grave. A few years ago I attended a funeral in the same graveyard; and after a slight search, discovered

the spot. The inscription, though of course much worn, was still quite legible.

I had not seen Henry Mason since his return; but I was glad to hear from Mr William Friend that, after the first passionate burst of rage and grief had subsided, he had, apparently at least, thanks to the tender and pious exhortations of his wife—with whom, by the kind intervention of the sheriffs, he was permitted long and frequent interviews—settled down into calmness and resignation. One thing only he would not bear to hear even from her, and that was any admission that she had been guilty of even the slightest offence. A hint of the kind, however unintentional, would throw him into a paroxysm of fury; and the subject was consequently in his presence studiously avoided.

A few days after the execution, Mr William Friend called on me just after breakfast, accompanied by the bereaved husband. I never saw so changed a man. All the warm kindness of his nature had vanished, and was replaced by a gloomy fierce austerity, altogether painful to contemplate.

'Well, sir,' said he, as he barely touched my proffered hand, 'they have killed her, you see, spite of all you could say or do. It much availed me, too, that I had helped to win their boasted victories;' and he laughed with savage bitterness.

'Henry—Henry!' exclaimed William Friend in a reproving accent.

'Well, well, sir,' rejoined Mason impatiently, 'you are a good man, and have of course your own notions on these matters: I also have mine. Or perhaps you think it is only the blood of the rich and great which, shed unjustly, brings forth the iron harvest? Forgive me,' he added, checking himself. 'I respect you both; but my heart is turned to stone. You do not know—none ever knew but I—how kind, how loving, how gentle was that poor long-suffering girl.'

He turned from us to hide the terrible agony which convulsed him.

'Henry,' said Mr Friend, taking him kindly by the hand, 'we pity thee sincerely, as thou knowest; but thy bitter, revengeful expressions are unchristian, sinful. The authorities whom thou, not for the first time, railest on so wildly, acted, be sure of it, from a sense of duty; a mistaken one, in my opinion, doubtless; still'—

'Say no more, sir,' interrupted Mason. 'We differ in opinion upon the subject. And now, gentlemen, farewell. I wished to see you, sir, before I left this country for ever, to thank you for your kind, though fruitless exertions. Mr Friend has promised to be steward for poor Willy of all I can remit for his use. Farewell. God bless you both!' He was gone!

War soon afterwards broke out with the United States of America, and Mr Friend discovered that one of the most active and daring officers in the Republican navy was Henry Mason, who had entered the American service in the maiden name of his wife; and that the large sums he had remitted from time to time for the use of Willy, were the produce of his successful depredations on British commerce. The instant Mr Friend made the discovery, he refused to pollute his hands with monies so obtained, and declined all further agency in the matter. Mason, however, contrived to remit through some other channel to the Davies's, with whom the boy had been placed; and a rapid improvement in their circumstances was soon visible. These remittances ceased about the middle of 1814; and a twelve-month after the peace with America, we ascertained that Henry Mason had been killed in the battle on Lake Champlain, where he had distinguished himself, as everywhere else, by the reckless daring and furious hate with which he fought against the country which, in his unreasoning frenzy, he accused of the murder of his wife. He was recognised by one of his former messmates in the 'Active;' who, conveyed a prisoner on board the American commander Macdonough's ship,

recognised him as he lay stretched on the deck, in the uniform of an American naval officer; his countenance, even in death, wearing the same stormful defiant expression which it assumed on the day that his beloved Esther perished on the scaffold.

GOSSIP FROM LONDON.

WE have progressed since my last. The Queen's Birthday is over; that anniversary on which mail-guards, postmen, and official understrappers make their appearance in new coats, rejoicing in all the brightness of virgin scarlet. 'Derby Day,' too, has come and gone; than which none causes so much stir and locomotion among metropolitan lieges, its gulf of vivid excitement now converted into a cud of mingled bitter and sweet for adventurers to chew. In the back-greens of law-courts, and other such crafty precincts, the grass and shrubs are emulating their country kindred; and our squares look summer-like in their foliage, which has at last come forth; while drouthy folk indulge in unwonted libations, reminding us that midsummer is at hand.

There are so many things to talk about, that I hardly know where to begin; however, the sale at Gore House will serve as well to lead off with as any other *quidnunc*. Few events of late years have created greater sensation in the world of *ton* than the dispersion of Lady Blessington's effects by the hammer; and during the view week, the road at Kensington was beset by long lines of carriages and pedestrians, all crowding to the centre of attraction. The sight was one well worth seeing; so numerous were the rarities and curiosities, and so tasteful the luxurious elegance. It is said that connoisseurs are disappointed that the portrait of her ladyship by Lawrence, on which Byron wrote a poem, sold for no more than three hundred and sixty guineas—poet and painter alike at a discount. But to particularise would demand whole pages; so I shall just remark that Gore House has seen strange contrasts in its occupiers—first the famous Whitbread, then Lady Blessington, and now, so says rumour, about to pass into the possession of a Quaker M.P.

I need hardly tell you that the Royal Academy Exhibition is the grand spectacle of the day; but, in addition to this, there are so many sights and *réunions*, that it is a wonder how people find time to 'do' them all. Whatever may be thought about the world growing wiser, there can be little doubt that it grows cleverer, as the industrial-art exhibition of the Society of Arts, the soirées of the Institution of Civil Engineers, and of Lord Rosse, the new president of the Royal Society, fully evidence. It is pretty well known that the late president, Lord Northampton, gave the soirées at his own residence; but those of his successor have been held in a suite of rooms in Somerset House. Of the four which take place during the season, three are now over; from five to six hundred gentlemen—titled and untitled, scientific, philosophical, and literary—having 'assisted,' as the French say, at each. You know of course that on such occasions it is customary to bring together models and specimens of new inventions and works of art, which, if the refreshments fail to do so, may give the visitors something interesting to talk about. Some of these things will bear talking about on paper, if you can put up with general description instead of technicalities. Foremost I may enumerate the working models of his two famous telescopes, brought over from Ireland by Lord Rosse. That of the 'monster telescope' especially conveys an accurate and satisfactory notion of the huge instrument to those whose opportunities do not admit of their taking a journey to Castle Birr to see the giant. We are promised ere long some account of its exploits. Then, commending itself to all interested in navigation, comes a model of Mitchell's screw-pile lighthouse, as erected on the Maplin sand. A cause of astonishment to the uninitiated in this, as in the case of the screw-propeller, is the apparent inadequacy of the screw to its office. It consists of a single disk of metal adjusted near

the lower extremity of the pile, whereby a sandbank may be penetrated, and the timber afterwards fixed in its place. The 'screw mooring' also exhibited is similar in construction: it may be twisted into any part of a shoal or bed of a river, where its powerful 'bite' affords secure hold for the attached buoy. In juxtaposition with such objects as these, you would see choice specimens of Daguerreotype; a triptych of the sixteenth century, dear to antiquaries; Varley's rotating-winch double-action air-pump; Clement's apparatus for making five hogs-heads of sugar per diem; or Hill's potato-crusher. Next in order are several beautiful designs intended to show the adaptability of iron to architectural purposes: the elegance and variety of the combinations are indisputable; but are iron arcades and houses suited to our English climate?

Gutta-percha again: specimens of wire coated with the Protean material, giving rise to projects for economical telegraphs. The wires raised on poles, as at present in use, are, as shown by experience, exposed to atmospheric disturbances and other casualties. You will remember the throwing down of miles of wire by the weight of accumulated snow, on the South-Eastern Railway at the beginning of this year. It is proposed to avoid such accidents, by burying a coated wire underground, carrying it across the country independent of lines of rail. This may be laid down for L.30 or L.60 per mile; in the latter case, the gutta-percha coating is in turn braided or 'served' with rope, and covered with marine glue. In Germany they content themselves by giving a coat of paint only to the gutta-percha; and according to the statements, there are 400 miles so prepared laid down on one of the lines in that country. If carried into execution as proposed, we shall be able to send you a message to Edinburgh at less than one-half of the present charges.

While on the subject of gutta-percha, a few words may very well be given to Mr Whishaw's inventions: among these are speaking-tubes, to supersede bells in private houses or offices. So extraordinary are the conducting powers of this new product, that a whisper can be conveyed to long distances; and it is obvious that much trouble will be saved by a person being able to state his wants without the preliminary delay of a bell-summons. The cost is not great; seeing that the tubes, with terminals or mouth-pieces, can be supplied at 8d. per foot. But we are, it seems, to be able to speak to a distance without any connecting tube at all; across the inner quadrangle of a building, for instance, by means of large concave gutta-percha reflectors, fixed, one opposite to the other, on each side of the court, at an upper window, if required, each having a short tube attached, through which the message is spoken. By experiment, the inventor has ascertained that a whisper can be heard at a distance of forty feet; and he anticipates hearing a loud-spoken tone from a quarter of a mile. Such an instrument has long been desiderated on railways during repairs, so as to avoid the delay which now occurs in sending a messenger from one gang of workmen to another. In this case each reflector would be mounted on a stand similar to that of a theodolite; and thus the portable telephone would be available where the telegraph, as at present arranged, does not admit of application. The instrument might be so fixed at each end of a tunnel, that the attendants at either extremity could communicate without leaving their boxes.

Perhaps you will say I am dwelling too long on these soirées; but I cannot leave the subject without noticing two other models, which you will very likely consider the most noteworthy of all. The first is Mr Appold's 'centrifugal pump for draining marshes,' &c.; and a most ingenious adaptation it is. You have heard of the turbine—a small box water-wheel possessing extraordinary capabilities for work. Well, Mr Appold's model contains such a wheel, made of tin, a little thicker, but not larger, than a halfpenny. This is fitted at the bottom of a square tube dipping into a small cistern

containing water, which may represent a lake, &c. The little wheel being made to rotate with great velocity, throws up water rapidly into the tube above itself, until it overflows in a continuous stream at the top, and the volume of this stream is such as to deliver eight gallons in a minute; and on applying a nozzle, the stream is driven to a distance of twenty feet. This, you will say, is a marvellous effect from so apparently insignificant a cause; but a wheel, about fifteen inches diameter, exhibited at the same time, will deliver 1800 gallons per minute: it requires, however, to be worked by an engine of four-horse power. Mr Appold has lately proposed to the engineer of the Dutch government to fix a similar wheel on the Haarlem Sea, now in process of being drained, by forty pumps driven by steam. A centrifugal pump of forty feet diameter would do more work than all the others put together, and would deliver—so the inventor asserts—1,500,000 gallons per minute. With such power at command, one would think we ought never more to hear of ships foundering at sea; and the emptying and reclamation of the Zuyder Zee resolves itself into a possibility.

Though last, not least, is the newly-invented machine for making *aprotypes*, which, to quote from the description, are—'Printing types manufactured by self-acting machinery, of copper or other hard metal, without the aid of heat.' It is the work of a Frenchman, Monsieur Pettit, expatriated by the unsettled state of affairs in his own country. Such a machine scarcely admits of being gossiped about, so I must just give you a summary of the inventor's own words. The essential principle of type-manufacture, he states, has remained the same since the invention of printing, more than 400 years ago; and, as is well known, the comparative softness of the metal employed is a defect. This defect is now overcome. 'The extreme durability of copper,' we are told, 'when employed as a printing surface, is fully admitted by all printers. A London firm, employed to print stamps for the government, is in the habit of using raised copper surfaces for this purpose. No less than 125,000,000 impressions have been taken from one of these plates! If this result has been arrived at with copper in its ordinary state, it must be evident that the durability of the aprotypes, formed of copper, hardened by the compression to which it is subject in the process of manufacture, will be almost infinite.' The first cost of 100 lbs. weight of the copper type exceeds that of ordinary type by more than L.20; but as it will last sixty times as long, there must be sixty renewals of the common type; so that ultimately there will be a saving in favour of copper of more than L.800: besides which, the production of bad work by the soft metal types at sixty different times in the same interval will have been avoided. The copper not only remains uniform, but effects an economy of ink in its greater power of resisting pressure.

M. Pettit informs me that he made three machines before he succeeded in reaching the present stage of perfection. The one exhibited is about four feet long and two feet wide, constructed entirely of iron or other metal, and is of enormous weight. There is a winch turned by hand, and a fly-wheel; on revolving this, fourteen different motions are produced, which, all combined, form the types from square strips of copper inserted in the proper place: so that the workman has nothing to do but turn the wheel, and types drop into a tray at the rate of thirty-two a minute! Many printers and scientific men have expressed their approval of the new machine; among the latter Professor Faraday, who explained its mode of action to the company assembled at Lord Rosse's soirée. The proposal is, to dispose of it in six shares of L.6000 each; two of these, it is said, are sold, one of the purchasers being an eminent London typefounder. And now, if all anticipations be realised, we shall from this time 'date a new epoch in the art of typography.'

Although I have done with the soirées, I must claim a letter-writer's privilege to discuss everything; and

under this comprehensive head I may mention, what you will be pleased to learn, that the Geographical Society have awarded their medal to Mr Layard for his eminent researches in Nineveh—a recognition of merit honourable to both parties. As new claimants rise to honour, old ones pass away. Mr Vernon is dead; but his name will live for centuries to come, while eyes are left to view the noble gallery of paintings, worth £120,000, which he gave to the nation. He doubtless foresaw this reward, when he had the good sense to decline an offer of knighthood made to him by authority. Faraday, amid his grand magnetic researches, has been making science familiar to juvenile auditories at the Royal Institution, in a course of six lectures 'On the Chemical History of a Candle.' Who can protest about *infra dig.* after this? But among other incidentals, there is one bearing on 'the sanitary interest:' the 'Lords' have been discussing the merits of a project for supplying Whitehaven with water from Ennerdale Lake. Those who have seen this magnificent sheet of water will recognise the excellence of the source, and we can but wish success to so promising a scheme. The distance is eighteen miles; and bearing in mind the Croton aqueduct of New York, which delivers 60,000,000 gallons every twenty-four hours, we presume the question of impracticability is not to be entertained for a moment.

To descend from great things to little: is it to the troubles in France that we are indebted for the *décrotteur*, or shoe-black, who, with his stand and polishing apparatus, has been seen of late about the 'west end?' I should like to see the profession become general in London. The convenience would be great for dirty-booted pedestrians. Besides this enterprising individual, we have a *marchand de gallettes* established in Fleet Street. Thus you see it does not always require revocation of Edicts of Nantes to send us foreign talent.

You are perhaps beginning to query if I ever mean to stop; yet to close without a few words about literature would be to omit an important item of the everything. I promise, however, not to be prolix. The Parliamentary Committee is still pursuing the inquiry relative to the establishing of public libraries in populous towns and districts throughout the country. This is a sign of the times. It is easier to lead educated minds, than to coerce brutal instincts and unreason. And here, too, it is worth remembering, that with a People's College at Sheffield and Nottingham, we are likely to have a third in the metropolis of the eastern counties—Norwich, where the building of one is proposed by a gentleman of fortune. Thus may we hope to

'Make knowledge circle with the winds.'

But apropos of literature: Sir John Herschel has re-written his astronomical treatise, under the title of 'Outlines of Astronomy;' and from such a source you may be sure that the advantage is on the side of scientific readers. And Dr Forbes, whom you would take for a staid medicus, having scamped over Switzerland last autumn with all the vivacity of a truant schoolboy, has just published 'A Physician's Holiday,' by way, I suppose, of making others as cheery as himself. Be this as it may, he tells some things unknown before, and has produced a very readable book.

Accounts from the continent state that no one there now cares to read any publication larger than pamphlets; and of these there are legions, in which vexed questions of politics are discussed with every variety of talent and temper. Among these trifles I observe one—'Journal d'un Insurgé Malgré Lui'—'Journal of an Insurgent in Spite of Himself.' There ought to be something worth picking out in such a book. It appears that the writer was taken prisoner by accident (?), and shut up in the cellars of the Hôtel de Ville, until removed to the dungeons of Ivry. He suffered much, and observed more; and comes to this conclusion—'insurrection ought never to be permitted.' Of a different stamp is the uniform series of quartos containing

the works of their best philosophers, printed at the expense of the French government. Laplace's works in seven volumes have recently been presented to various institutions in this country by the minister of public instruction. The Academy, too, in conjunction with this functionary, offers a prize of 600 francs for 'Un Petit Traité'—or rather 'A short Treatise on Popular Hygiene, avoiding purely Scientific Details, for the Use of Workmen in Towns, and the Inhabitants of the Country.' The book is to be more especially adapted to the department of Seine-Inférieure, and is to convey general precepts in the most attractive style possible.

In France, the early history of the language has been much studied; and the Academy, with a view to the further promotion of the study, is about to republish the most ancient known French Grammar. Singular enough, this was written by an Englishman, Jehan Palsgrave, tutor to Princess Mary, in the reign of Henry VIII. There are but six copies in existence; and of these, five are in this country, and one in Paris, in the Mazarine Library. Being written in English, it is said the peculiarities of the old pronunciation will be better detected than if the work had been written in the vernacular of Gaul.

It has often been a reproach to our government that they neglect the collection of our national historical documents; and in the reign of George IV. an order was issued to remedy this defect. The results have now appeared in the first of a series of thick red-backed folios, entitled 'Monumenta Historica Britannica,' or 'Materials for the History of Britain, from the Earliest Period to the End of the Reign of King Henry VII., published by Command of Her Majesty.' This initiatory volume contains the writings of Gildas, Bede, Asser, Aethelweard, Henry of Huntingdon, Maistre Geffrei Gaimar, with many others, and the Anglo-Saxon Chronicle, and engravings of coins. At the same rate, a volume in twenty years, we shall have to wait a long time for the remainder of the series.

But if legislative debates have a claim to interminability, gossip has none—so, *ad rescribendum.*

A MONTH AMONG THE PYRENEES.

As the regular routine of a Pau season, where either health or pleasure is concerned, includes a few weeks' residence at some of the many watering-places among the mountains, we proceeded to the Eaux Bonnes immediately on giving up our apartment in the pretty little town where we had so pleasantly passed the winter. My brother had hired a calèche for the summer, with three horses and a driver, on very reasonable terms. The driver was a very intelligent man, and proved extremely useful to us in the course of our wanderings.

Our drive from Pau through Gan to Louvie was both cold and rainy, although it was near the end of May at this time. The air became really piercing as we advanced deeper among the hills; but we forgot all discomfort as we proceeded, the scenery became so beautiful. The road lay up a valley enclosed by mountains, whose summits seemed to reach the clouds, and it followed the course of a rapid stream through a gorge sometimes no wider than the road and river, sometimes opening into meadows, sometimes extending into plains. There was no want of wood on the lower slopes of the hills or in the valley. Many a pretty-looking hamlet improved the cheerful aspect of our route; and here and there a smaller glen diverged on either hand, as if there were no end to the intricacies of this range of the Pyrenees. We stopped frequently to walk to different points of much attraction; and in this way so lengthened the journey, that it was late in the afternoon when we reached a large plain filled with villages, and through

which flowed several small rivers, the marble quarries and the huts of the labourers in them appearing high up among the forest-trees that covered the lower sweeps of the distant mountains. From this basin-like plain a road turned off over a handsome bridge, and up a very steep hill above a mile in length, ending in a ravine, along one side of which, on a narrow ledge a considerable height above the torrent, which we heard thundering below, runs a row of high white houses, built for the visitors to the Eaux Bonnes. We put up at the Hôtel de France; and ordering fires in the bedrooms allotted to us as our private chambers, we declined the public table for that first evening, and drank our tea in my room in English solitude. The singularity of our abode struck me the next morning with wonder. There we were in a very large hotel, one of a long row of high houses, for there are fifteen of these boarding-houses rising from a shelf apparently just wide enough to support them, a precipice below, a mountain behind, and a mountain opposite—the noise of rushing waters ever filling the ear, so many cascades dash down into the troubled stream which frets along among the rocks at the bottom of the ravine. The shelf looks narrower than it really is; for besides the houses which stand on the brink of the precipice, there is a road and a side-path between them and the sheltering mountain, and part of the way a narrow strip of shrubbery, and a little brook running along beside it carrying away the waste waters of the springs. These were within a few minutes' walk of our hotel. The street ends abruptly by turning off round a corner of the rock, and forming a crook of some hundred yards long, piercing into the hill as it were. This crook contains a few private houses, the rooms in which are let as required to those who prefer a more retired life than is led in the hotels, the pump-room, and the chapel. We determined on following exactly the prevailing habits of the place, and therefore decided on remaining where we were with a large agreeable party, many of whom were well acquainted with us, and in lodgings where cleanliness, space, comfort, and good cookery were all combined for by no means an extravagant charge; for we had made our bargain, and soldered it with the magic 'tout compris.'

We found our life a very pleasant one. We rose early; went to the springs; wandered about till the hour of our substantial breakfast; formed then the parties for excursions, which occupied the remainder of the morning; dined all together in the fine room, which would have held almost as many more; and spent the evening in the still finer saloon, where work, reading, cards, music, and dancing went on without effort, and where a lively conversation, full of wit, full of good-nature, and full of information, accompanying manners studiously polite and often high-bred, made these sociable *réunions* really enjoyable. The company from the other houses frequently joined us, and we returned the compliment, when, although we had only amateur music, the younger members of our society managed to play the double parts of band and dancers, till the elders began to wish for their pillows, as no late hours overnight ever prevented the early walk to the pump-room. Whether it were the waters in which my invalid son bathed daily, and drank of plentifully, or the fine air, or the gay spirits round us, or altogether, I know not, but never did any one so rapidly gain strength as did my boy up in this beautiful wilderness. We were almost always out, on foot or pony back, wandering in all directions among the mountains—sometimes along roads leading to well-known places, sometimes sauntering in the well-kept walks nearer at hand, sometimes led on by a mere

bridle-path to some hidden hamlet, stumbling upon some fantastic rock or some enchanting waterfall, or some deep narrow glen running up into the gloomy forest, from whence issued the smoke of the charcoal burner and the sound of the woodman's axe. The picturesque appearance of the small villages, or the still more interesting lonely cabin, either perched on some height, or half-concealed by the woods of the valley, at a distance, added considerably to the peculiar beauty of the ever-varying scenery. Close at hand, they are rather squalid-looking dwellings, small, low, and rudely finished, and very untidy about the doors, exhibiting no luxury, but containing the few humble comforts required by so hardy a people. There appeared to be a sufficiency of food and fuel among them; good bedding was invariable, and good stout clothing. The capuchin, or hood, which is generally worn here by all during rainy weather, is a singular addition to the head-gear: it is nothing but a bag open on one side, pulled on over the cap or handkerchief quite low down upon the shoulders, the corner left sticking up as a top; but being generally of a bright colour on the women—scarlet trimmed with black, or gray trimmed with scarlet—the effect is gay as well as odd. The men seldom afforded themselves any stuff better-looking than sacking—the same dingy hue at least—without any ornamental edging, though the material was woollen. When not required as a *parapluie*, the capuchin is folded flat, and stuffed into the belt of the blouse, or apron, unless it can be used as a cushion beneath the weighty burdens always borne on the head in these mountains, and by the women mostly, who seemed indeed to do all the drudgery, the men employing themselves as herds or shepherds, in the quarries, or in the forest, where their habits of labour were beyond my observation. I can only answer for the industry of the hard-worked women, none of whom ever seemed to lose a moment: when not in the fields, their knitting was ever in their hands—they would trot merrily along, a fagot on their back, or a pail or a basket on their head, knitting all the while faster than my eye could follow the needles. The dress of both sexes was well suited to the rough weather of the mountains, but it was extremely ugly: dark gowns, dark aprons, and dark handkerchiefs on the women; dark caps, dark blouses, and dark trousers on the men; and no linen to be seen on either.

My love of wild flowers carried me often on foot distances I should hardly have ventured on had I set out with the intention of reaching them. Often, too, this taste set me scrambling up and down to positions a little awkward for an elderly gentlewoman, who, the excitement of advance over, found the retreat in cold blood sometimes difficult. These adventures, however, formed a very amusing foundation for our evening gossip, and also led to a more intimate acquaintance with a young person in whom I became extremely interested—a young English lady, of great skill as a botanical artist. She arranged all my beautiful bouquets scientifically in her dried collection, copying them first, by painting them on card-paper, as I have seldom seen nature rivalled. The colours she employed she procured in Pau, in little round flat cakes, mixed up, not with gum, but honey. Their brilliancy and softness are much beyond anything we are at home accustomed to. I should think the result of our united labours must form a rare collection: many of the larger flowers were superb, and I hardly think my researches omitted one of any size or species, so that the Flora of this part of the Pyrenees was perfectly represented. The best part of the employment was the improvement in the health of this very delicate young person during its progress. She and her donkey soon penetrated into many of my recesses of treasure; and though the rocks and water-courses remained beyond her reach during our stay at the Eaux Bonnes, she had explored them all before we met again at Cauterêtz.

One of our favourite long walks was to the Eaux Chaudes [Hot Springs], to which there was a short

footpath across the hills, rude in many places, and not altogether free from danger in descending to, or crossing, the torrents. The ordinary approach to these hot springs by the carriage-road made a considerable round; for when we drove there, we had to return to the wide plain full of villages, and after recrossing the bridge to meet the Pau road, we followed it on straight up the steepest hill anybody almost could ever have had to ascend in a carriage. Near the top, the rock has been tunnelled through to admit of a passage, the overhanging summit rendering any other mode of reaching the opposite side of the mountain impracticable. In this narrow, gloomy vault, where an icy blast always meets the traveller, stands a small chapel dedicated to the Virgin, who is supposed to protect all wayfarers during the dangers of this journey, paying her for the same a few sous merely, the descent on the other side being fully as steep, though not quite so long, as the ascent. It is a zig-zag road, cut out of the rock, by the side of which a torrent dashes turbulently down in the chasm it has worn on the face of the precipice. The scene is so wild, and made me so nervous the first time I travelled it, that I felt quite relieved on reaching the bottom, and turning round the wall of rock which had screened us from all other prospect, to find myself in another valley, where, nestled down in a quiet meadow, was a small hamlet, attached to what appeared to be a fine baronial castle.

This imposing edifice is placed on a rocky promontory, which rises from the bank of the river, and shows remarkably well amidst the steep surrounding mountains. It is the new bath-house, which has been for many years in the course of erection, and is to contain baths, pump-room, library, and shops below, and numerous apartments for the invalids above. But French workmen are proverbially slow—so slow, there is no saying when this spacious building will be ready for occupation—and in the meanwhile the few sick persons who now visit these waters must lodge in very indifferent quarters, and put up with the dreary but essentially comfortable accommodation of the old bath-house. This we entered from the road by an upper floor, and then descended a staircase to a long corridor connecting the two wings of the hotel, where we found established a cook-shop, a confectioner, a grocer, a wine-shop, all in a row, diligently served by tradesmen visitors, who come during the season to supply invalid visitors with these necessities. It is not much the fashion to resort to the waters here: they have gone out of repute since Caunteretz and Barèges became so celebrated: probably their fame may revive with their improved accommodation, for the scenery around, and on far into Spain, is wonderfully fine, and they are just in the way of the most interesting of the many excursions to the various mountain-tops to which tourists in general have such pleasure in ascending. My brother was foremost in all these enterprises. He never seemed to me to be satisfied while there was any height above him he had not reached. Every *pic* on the Pyrenees he had, I believe, the satisfaction of remembering he had set his foot on, though I never could make out that he saw anything from them surpassing the beauty which quite contented me in the valleys. We once or twice drove as far as Gabas, where stands a small Spanish customhouse on the frontier. The scenery on this excursion was superb. Mountain rose above mountain, rock towered over rock, assuming every sort of fantastic shape; often taking the resemblance of battlemented keeps, or the long flank walls of a time-stained fortress. And then we entered the forest, where the black pine, oak, and other hardwood trees, mingled with the lighter birch near the stream, combined to form a gloom that was delightful: through which, and a thick underwood of box, we peeped to catch at intervals small patches of verdure, brilliant with flowers. We crossed the river several times by means of good wooden bridges, and at these opportunities observed that sheep covered the lower hills;

cattle, with a few mares and foals among them, grazed upon the strips of meadow; and sometimes a goat appeared gazing from some pinnacle. We saw no habitations after leaving the Eaux Chaudes a couple of miles behind; and it was not till I mentioned, in surprise, the absence of all visible owners of these flocks and herds, that I heard of the curious village, hidden from view high up among the fastnesses of nature's contriving, where dwell the singular people who boast so wide a pasturage. On through this wild ravine still stretched the well-engineered road, the increasing gloom of the forest adding to the interest with which we traversed its solitary length. Eagles soared above: cascades innumerable dashed down on every side. We were shown the paths by which, during the winter season, the hunters tracked the bear, and the rocks where the wild-cat and the wolf were sheltered. A lively trade in furs is carried on through the medium of the active mountaineers, who bring many varieties of this rich merchandise into the market, the martin-sable of the Pyrenees, in particular, being much sought after.

In summer, no such exciting employment is going on. The only evidences of man we met with were the newly-felled pines, which lay in large piles among the underwood, waiting to be barked by the woodmen, who carry on their trade in a rude style, marking the little progress in the arts yet made in these remote regions. An axe, and a small double hand-saw, by the aid of which two indolent workmen cut up a log into planks, was all the machinery they seemed to be acquainted with. The branches lopped off the trees were made into charcoal on the spot by a set of most hideous old women in dark dresses, who also gathered the bark. The general run of the timber was used for building and for firing in the district, but any very large tree is sent off to Bordeaux or Bayonne for the shipping.

Another of our long excursions was to Oleron, from whence we went to visit the Vallée d'Aspe. This indeed involved an absence of a few days, as the distance was considerable. We had to drive down the steep hill, and back to the plain with the villages, and then retrace our route along the valley to Louvie. We then left the Pau road, and struck off to the west, skirting the roots of the mountains, across a very fertile plain to Oleron, a large town, not remarkable for much but its situation upon two wide rivers, and the surrounding well-wooded and well-cultivated fields. Part of the country we were now travelling through was very park-like, very English, in many places very pretty, full of small châteaux and villages, which looked well at a distance, though they were disappointing to enter! On arriving at the lower part of the Vallée d'Aspe, we found that it resembled North Wales—a rich and peaceful scene, quite pastoral in its character—a rest to the imagination after the sublimer scenery of the Eaux Chaudes and the Eaux Bonnes. The low hills, of various forms, are cultivated nearly to the top; the fields are of many strange shapes, divided by wooding, and dotted all over with little clumps of trees, half concealing the cottages: a wide river flowed quietly through the meadows—all was repose for the first few miles of our journey. Bédous, where we stopped to feed the horses, is a sort of town in a large plain, perfectly uninteresting; and the inn so little agreeable, that as soon as we had shown our passports to the gendarmes (for Bédous is another frontier station—Spain was very near us), we took our sandwiches in our hands, and walked to a waterfall at a little distance, considered to be among the finest in the district. We also crossed the river, and went along a rude mountain-road to the village of Osse; a collection of mean cottages set down on a bare hill-side—stones being the principal feature in its scenery. We had stones all round us; we walked over stones and by stones; and there were stone-walls for hedges, and no trees anywhere. About three hundred Huguenots are collected here in thirty or forty houses, who, thus isolated from their brethren of the Reformed faith, have maintained the integrity of their

creed from the time of the Albigenses. Their perpetual intermarriages have resulted in lowering their capacities, mental and bodily, to a very unfortunate degree. Slow, lazy, stunted in every way, many of them deformed, they have vegetated in the miserable discomfort consequent on their increasing inertness till this present time, when a possibility of improvement has presented itself in the form of an intelligent young man, sent from the Evangelical Normal School at Paris, where he was educated, to take charge of the rising generation. He is paid by the society; supplied by it with books and other school requisites; and he teaches much after our own improved methods—by the help of monitors, tablets on the walls, the black-board, and pictures, which last he told me had had the effect of wakening up the minds of very dull pupils. One cannot but painfully regret the degree of ignorance which has tended to degrade this unfortunate community. At the time of our visit, the pastor was a superannuated old man, more occupied with the means of supporting his family than zealous in his clerical duties. His house was the best in the village, yet was but a poor one. His kitchen, in which he seemed to live, was no better finished than any small farmer's in the district; it was, however, well filled with simple stores, implements of husbandry, bright pots and pans, and all the evidences of woman's thrift. His daughter or granddaughter was at her wheel within the large chimney, dressed like the peasants of a humble class, as was the old minister, who must 'rest in peace' ere the schoolmaster's labours can be fully rewarded. A young and better-instructed priest would much assist in the regeneration of this desolate place: but he would need to be an enthusiast in his holy calling; none else could endure so cheerless a situation among a degraded people, despised by their neighbours, and with no means of living on a sterile mountain amid rocks, and stones, and misery, but the poor pittance paid by the French government to the dissenting clergy.

Close to Bédous there is a column in the centre of a field raised to the memory of a Bernais poet, much admired by all classes of his countrymen: his verses are in all mouths, but being in the patois tongue, we could not comprehend their peculiar beauty. There is a Roman inscription on a rock near the first bridge we crossed on entering the valley, announcing the advance so far of a cohort more than a thousand years ago. Traces of the Romans abound in these parts, their love of mineral waters having led them to most of the health-restoring springs of these mountains. We stopped at Sarrance, a very pretty village, to see its very pretty church, much resorted to all through the summer by sick pilgrims, who come to beg the prayers of 'Our Lady,' represented here by a small stone image, which tradition reports to have fallen from heaven in a miraculous manner. Another tradition has it, that the Romans dropped this image in the river as they crossed, and that the legion long lamented its 'Minerva.' The fine bracing air of this sunny spot may have something to do with the cures certainly effected under the shadow of the shrine of our 'Lady of Sarrance,' who, like many other excellent objects, must have that within which passes show, for she can boast of little outward beauty. She is rudely hewn in black marble, her features much defaced, and her stature of the smallest, being but a foot and a-half in height. She is very finely dressed, and is enclosed in a box, with one side of it glass, which turns upon a pivot, so that she can either look out from the top of her altar upon the faithful kneeling below, or turn to a select few in her private chamber, whither we ascended by half-a-dozen steep steps to have a nearer view of her. The attendant priest quitted the confessional hurriedly upon our entrance, pushing aside with little ceremony his humble penitents, to do the honours of the shrine to a party of strangers. As we drove on towards Oleron, and again on driving from it, the scenery around reminded me of Kent—fine old wood, heights and hollows, hedges, corn-fields, and a great

many country-houses, and no water after leaving the two rivers at Oleron behind. It was all rich and lovely, but tame when compared with the wildness of the mountains towards which we returned, with the sort of joy that one feels on meeting old friends again; so surely do the more marked features of a rugged landscape impress the heart of a true lover of nature. The walks about the Eaux Bonnes were more attractive to us than ever; and in particular I took pleasure in wandering low down by the rocky banks of the stream, whose thunders we heard so plainly from our aerial dwelling, though we seldom saw much of it till we sought for its foaming waters among the trees which shrouded its course. This noisy torrent leaps, rather than flows, from one rock to another, forming a succession of rapids each more attractive than the last, till in some half-dozen places it meets with an obstruction of sufficient size to send it foaming down in what would be quite a cascade elsewhere.

The air, the pure water, the cleanliness, and the cheerfulness of this singular place, made us leave it with regret; but the proper time had been spent at these fountains, and we were ordered to Cautez. There is a bridge-road across the mountains between the two places, which we at one time thought of taking, sending the calèche with the luggage round by the public road; but on further consideration, we abandoned this excursion, on account of a fancy I or my son had taken to return to Pau. The company of actors appointed to this district had arrived there, and I had got it into my head that I should like to see them. I had not been at a play for years—at a French play never—and as the Toulouse theatre had a fair reputation, I wished to take advantage of this visit from part of the troop, to form my own judgment of French comedy. We took rather a large party with us, many of our Eaux Bonnes friends agreeing to accompany us. On our arrival at Pau, we found it necessary to take a whole box for the somewhat numerous party. The theatre is small: it was well, though not brilliantly lighted, and there was little scenery, and only three or four actors, yet I never was more diverted. They gave us two vaudevilles of one act each; five actors appeared in one, only four in the other. They were perfectly well dressed; there were no clap-traps, no hints to the galleries, no allusions to the politics of the day, and very little story; but that little was so well told, the actors were so completely the people they represented, they were so fully occupied with their parts, apparently so unconscious of an audience, the dialogue was so spirited, so well given, that we were carried away in earnest by the illusion. One young actress would have been quite a 'star' in England from her comic powers: she had a fine clear soprano voice too. Besides these little comedies, a young Spaniard played very brilliantly on the pianoforte between the pieces; music that was very agreeable to listen to, from the beauty of the several airs he introduced into his composition, and the style and the touch he was master of. There was also some very good dancing by three members of the *corps du ballet* at Madrid, who were making a little money on their return to Spain from Paris, where they had just concluded an engagement. They were handsome young people, very graceful, and very agile, and particularly happy in their costumes, which were varied to suit their dances. When they danced the 'fandango,' the girl wore a dress of white satin, flounced and trimmed with broad black lace, the effect of which was really elegant, though in description reminding us a little of the magpie. I daresay these active Spaniards were capable of performing all those astonishing whirls, and twirls, and flights, and contortions, so much in fashion at our own Opera; but they had the better taste to confine themselves to national dances of a lively character, during the evolutions of which they merely attitudinised a little more than unprofessional exhibitors would have considered seemly. Altogether, we passed a most agreeable evening; and

we all agreed, that if the Toulouse company rank only third amongst the provincial actors, numbers two and one must be well worth taking a longer journey than our twenty miles to see.

CURIOSITIES OF METEOROLOGY.

METEOROLOGY, or the science of the phenomena of the atmosphere, can scarcely be said to have been known at all before the latter part of the last century, since it was not till then that the atmosphere wholly ceased, in the imaginations even of the learned, to be a simple body, and was divided into its constituent fluids. The proportions in which are intermixed the two gases oxygen and nitrogen, forming the air we breathe, are the first curiosity we meet on entering the subject, and fill us with surprise and admiration. Two volumes of the former fluid, and half a volume of the latter, compose the atmosphere, fitted for the respiration both of the animal and vegetable world: but if differently combined, even in a slight degree, what would be the result? If instead of half a volume of oxygen there were a whole volume, all mankind would die in convulsions of intoxication, for the production would be nitrous oxide or *laughing gas*. If the volumes were equal, then we should have the poisonous acid called nitric oxide; and if two of nitrogen and five of oxygen, instead of the wholesome fluid surrounding our globe, there would be a sea of aquafortis! In short, the *only* combination of the two gases fitted for the support of animal and vegetable life is precisely the one that exists.

In a former paper, we mentioned the curious effect of elevation upon the temperature of boiling water; and in a work which will supply us with abundant materials for the present article—and which we wish strongly to recommend to our readers*—there is an anecdote on the subject taken from a traveller on the Andes. 'Our potatoes,' says Mr Darwin, 'after remaining for some hours in the boiling water, were nearly as hard as ever. The pot was left on the fire all night, and next morning it was boiled again; but yet the potatoes were not cooked. I found out this by overhearing my two companions discussing the cause; they had come to the simple conclusion that the potatoes were bewitched, or that the pot, which was a new one, did not choose to boil them.' This phenomenon depends upon the weight or density of the atmosphere, which becomes less as we ascend. The weight of the whole mass of air surrounding the globe is computed to be equivalent to that of a globe of lead sixty miles in diameter; or, according to other writers, if expressed in tons, it would give 5114 *billions*.

The temperature of the currents of air that sweep across the ocean, and diminish the region of cold on the land, is another curious subject. The explanation usually given is, that these winds chill the particles of water on the surface of the deep, which immediately descend, and have their places supplied by others, warmer, and of less specific gravity; and that this goes on till the temperature of the wind itself is increased.

Of the various phenomena of the atmosphere, that of twilight is one of the most beautiful. 'Although it is the western horizon,' says Dr Thomson, 'which glows most lovingly, still, immediately opposite the setting sun, especially under certain atmospheric conditions, the eastern sky partakes of the roseate hues. The intensity of this tinge is greatest at the moment when his disk sinks below the horizon. It is the last effort of the sun to dart his rays upon the sky before leaving us for the night, which reach us by reflection, deprived of all their colours but the red. Below this a deep-blue or dusky-looking segment appears, and when circumstances are favourable, it is well defined. This is the *anti-twilight* of Mairan: it is the shadow of our globe cast upon the sky.' Our author notices the singular brightness witnessed

at midnight in some European countries in 1831. This second twilight (if such it was) was so light, that small print could be read; and during the months it appeared—August and September—the barometer fell, storms swept the earth, and the sun was of a silvery whiteness. At the north pole, from the autumnal to the vernal equinox, there is a period of continual twilight, then of continual night, and then of twilight again, till the sun asserts his place in the sky, and reigns supreme. Continual daylight! What a splendid idea! Captain Beechey and his comrades were at first reluctant to quit the deck; and when they did so, it was so wonderful—when they came again to keep their *night-watch*—to find the sun still gilding the firmament! But this soon became irksome; and the mariners, taking a lesson from the instinct of the birds around them, went to their roost at a regular hour.

Clouds are not essential, as they are commonly supposed to be, to the phenomenon of rain. Sometimes the rain may be wafted on the wind from a distance; but it likewise may arise from the condensation of moisture, 'without its passing into the intermediate state of clouds. In the higher regions this vapour may become frozen, even without the semblance of a cloud, and descending to a warmer stratum, be again dissolved, dissipated, or precipitated.' Sir J. C. Ross tells us that in the South Atlantic it rained for above an hour when the sky was free from clouds. In the Mauritius this is not a rare phenomenon; but in Europe, the greatest time of its duration was ten minutes at Constantinople. In old writers we are frequently told of the sky 'raining blood;' and in fact a red rain, as well as a red snow, is perfectly well authenticated. There occurred a fall near Bristol consisting of the seeds of ivy-berries. Pollen showers, vulgarly called yellow or sulphur rains, are common: some are the pollen of the Scotch fir: and one extraordinary fall of this kind of rain, which took place during the night, was phosphorescent, and greatly alarmed the beholders. 'On the afternoon of the 11th of June 1847, the wooded part of Morayshire appeared to smoke, and for a time fears were entertained that the fir plantations were on fire. A smart breeze suddenly got up from the north, and above the woods there appeared to rise about fifty columns of something resembling smoke, which wreathed about like water-spouts. The atmosphere now calmed, and the mystery was solved; for what seemed smoke, was in reality the pollen of the woods.' Showers of 'manna' are frequent, and consist of an esculent lichen, which in time of famine has often done good service. In 1670, the lakes and ditches at the Hague looked like blood; an appearance which was discovered by the microscope to be owing to myriads of small red animals. In 1815, a lake in the south of France suddenly became a patchwork of red, violet, and grass-green, and was referred to similar natural causes by the experiments of Klaproth. In short, the preternatural rains of the olden time are ascertained by science to have received their colour from plants, animalcules, or mineral substances.

The phenomenon of a celebrated *black rain* has not been explained. 'Upon the 23d November 1819 a very remarkable black rain fell at Montreal, accompanied by appalling thunder. It was preceded by dark and gloomy weather, experienced over the United States: at times the aspect of the sky was grand and terrific. "In Montreal the darkness was very great, particularly on a Sunday morning; the whole atmosphere appeared as if covered with a thick haze of a dingy orange colour, during which rain fell of a thick and dark inky appearance, and apparently impregnated with some black substance resembling soot. At this period many conjectures were afloat, among which, that a volcano had broken out in some distant quarter. The weather after this became pleasant, until the Tuesday following, when, at twelve o'clock, a heavy damp vapour enveloped the whole city, when it became necessary to light candles in all the houses; the stalls of the butchers were also lighted. The appearance was awful, and grand in the

* Introduction to Meteorology. By David Purdie Thomson, M.D., Grad. Univ. Edin., Licent. Roy. Coll. of Surgeons, Edin. Blackwood and Sons, Edinburgh and London. 1849.

extreme. A little before three o'clock a slight shock of an earthquake was felt, accompanied with a noise resembling the distant discharge of artillery. It was now that the increasing gloom engrossed universal attention. At twenty minutes past three, when the darkness seemed to have reached its greatest depth, the whole city was instantaneously illuminated by the most vivid flash of lightning ever witnessed in Montreal, immediately followed by a peal of thunder, so loud and near, as to shake the strongest buildings to their foundation, which was followed by other peals, and accompanied by a heavy shower of rain of the colour above described. After 4 p.m. the heavens began to assume a brighter appearance, and fear gradually subsided."

Showers of sand and earth have been numerous; but showers of flesh, fish, frogs, &c. are worth noticing. The flesh 'was recognised as a distinct substance by Scheuchzer about the beginning of last century, and in 1747 its true animal nature was shown by Lemonnier. Since then, its properties have been investigated by Vauquelin and others. It bears a greater resemblance to mucus than to gelatine or tannin; but it does not exactly agree with any one of these: it is unctuous, grayish-white, and when cold, inodorous and tasteless: it is soluble in hot water, and then resembles thin beef-tea.' This substance has skin attached, and resembles human flesh! In South America, in 1698, an area of country forty-three miles square was strewn with fish; and in England, at a considerable distance from the sea, a pasture-field was found scattered over with about a bushel of small fish. A shower of herrings fell in 1825 in Kinross-shire; but instances of the same kind are numerous both in this country and elsewhere. At Ham, in France, M. Peltier, after a heavy rain had fallen, saw the square before him covered with toads. 'Astonished at this, I stretched out my hand, which was struck by many of these animals as they fell. The yard of the house was also full of them. I saw them fall on the roof of a house, and rebound from thence on the pavement. They all went off by the channels which the rain formed, and were carried out of the town.'

Blood spots have produced greater terror than even red rain. 'A widow chancing to be alone before her house in the village of Castelschloss, suddenly beheld a frightful spectacle—blood springing from the earth all around her! She rushed in alarm into the cottage; but, oh horrible! blood is flowing everywhere—from the wainscot and from the stones—it falls in a stream from a basin on a shelf—and even the child's cradle overflows with it. The woman imagines that the invisible hand of an assassin has been at work, and rushes in distraction out of doors, crying murder! murder! The villagers and the monks of a neighbouring convent assemble at the noise; they succeed in partly effacing the bloody stains: but a little later in the day, the other inhabitants of the house, sitting down in terror to eat their evening meal under the projecting eaves, suddenly discover blood bubbling up in a pond—blood flowing from the loft—blood covering all the walls of the house. Blood—blood—everywhere blood!' These spots were merely mould; the remarkable, almost instantaneous growth of fungi in a humid atmosphere.

In Scripture we read of hailstones being miraculously showered down upon the Canaanites, and of the 'thunderings and hail' which struck the Egyptians with terror. In other countries there have been natural showers of the same kind. In England, in 1202, hailstones fell as large as eggs; at the end of the seventeenth century some were found measuring from eight to fourteen inches in circumference; and in Scotland, in 1269, 'there rose "great winds, with storms of such unmeasurable hailstones, that manie townes were thrown down" by their violence, and fires spread throughout the kingdom, "burning up steeples with such force of fire, that the belles were in diverse places melted."' In the Orkney Islands, in 1818, hailstones were gathered as large as a goose egg; and in 1822, men and animals

were killed by them on the banks of the Rhine. 'The most extraordinary hailstone on record is said by Heyne to have descended near Seringapatam towards the close of Tippoo Sultan's reign: it was as large as an elephant!'

The icebergs are immense glaciers which have tumbled from the mountains into the ocean. 'Frost,' says Penant, 'sports with these icebergs, and gives them majestic as well as singular forms. Masses have been seen assuming the shape of a Gothic church, with arched windows and doors, and all the rich drapery of that style, composed of what an Arabian tale would scarcely dare to relate, of crystals of the richest sapphire blue; tables with one or more feet; and often flat-roofed temples, like those of Luxor on the Nile, supported by transparent columns of cerulean hue, float by the spectator.' Icebergs have been seen in the form of church spires 300 feet high. Some have an area of six square miles, and are 600 feet high.

We now come to a different, and perhaps a more interesting class of phenomena. The glory surrounding the shadow of the observer in certain conditions of the atmosphere has frequently attracted attention. 'During the intense frost of January 1820, this beautiful meteor was seen at Perth, upon the fog which arose from evaporation from the ice upon the Tay. Looking from the bridge, the spectator beheld his shadow on the vapour, of gigantic size, surrounded by a halo, and throwing off prismatic radiations.' An analogous appearance was sometimes witnessed by Mr Green, the aeronaut, when about two miles above the earth. It was the shadow of his balloon thrown upon the upper surface of a cloud, and always surrounded by a triple iris. The parhelion, or mock-sun, is a more magnificent meteor, but it has been frequently described. The mirage is usually caused by 'the irregular refraction of light passing through strata of air of unequal density.' 'Dr Vince, when at Ramsgate, saw the whole of Dover Castle, as if upon the Ramsgate side of a hill which obscures the castle, excepting the turrets, from that town. Between Ramsgate and the land from which the hill rises, almost six miles of sea intervene, and about the same distance thence to the castle, which stands upon a cliff about 320 feet above the sea. During the continuance of this beautiful mirage, the castle was so vividly depicted, that the hill did not itself appear through the image.' On the beach at Hastings, the coast of France, from Calais to Dieppe, became distinctly visible; and the fishing-boats were seen with a glass lying at anchor. When human figures in motion, such as soldiers, are seen in this spectral manner, the picture becomes very exciting, and may account for some appearances described in history—such as the phantom-fight of Artaveld—and set down as preternatural. A phenomenon of this kind was seen on the Mendip Hills. 'It represented a large body of troops moving onwards with drawn swords; their position and space were often changed; and so distinctly were they visible, that the very trappings of the horses, and the several accoutrements of the soldiers, could be distinguished: the phenomenon lasted above an hour. It was afterwards ascertained that a body of yeomanry were practising about fifteen miles off.' The following is still more interesting, and is susceptible of a similar explanation. 'On a summer evening in the year 1743, when Daniel Stricket, a servant to John Wren of Wilton Hall, was sitting at the door along with his master, they saw the figure of a man with a dog pursuing some horses along Souterfell side, a place so extremely steep, that a horse could scarcely travel upon it at all. The figures appeared to run at an amazing pace, till they got out of sight at the lower end of the fell. On the following morning, Stricket and his master ascended the steep side of the mountain, in full expectation of finding the man dead, and of picking up some of the horses' shoes, which they thought must have been cast, while galloping at such a furious rate. Their expectations, however, were disappointed.' In the following

year, the same Daniel Stricket was walking about seven o'clock in the evening, a little above the house, when 'he saw a troop of horsemen riding on Southerfell side, in pretty close ranks, and at a brisk pace. . . . The equestrian figures seemed to come from the lowest parts of Southerfell, and became visible at a place called Knott. They then advanced in regular troops along the side of the fell till they came opposite to Blakehills, when they went over the mountain, after describing a kind of curvilinear path. The pace at which the figures moved was a regular swift walk, and they continued to be seen for upwards of two hours; the approach of darkness alone preventing them from being visible. Many troops were seen in succession; and frequently the last but one in a troop quitted his position, galloped to the front, and took up the same pace with the rest.'

The Fata Morgana, as seen from the Straits of Messina, is thus described by an Italian writer:—'On the 15th August 1643, as I stood at my window, I was surprised with a most wonderful and delectable spectacle. The sea that washes the Sicilian shore swelled up, and became, for ten miles in length, like a chain of dark mountains; whilst the waters on the Calabrian shore grew quite smooth, and in an instant appeared as one clear polished mirror, reclining against the ridge. On this was depicted in *chiaro-scuro*, a string of several thousand pilasters, all equal in altitude, distance, and degree of light and shade. In a moment they lost half their height, and bent into grades like Roman aqueducts. A long cornice was next formed upon the top, and above it rose innumerable castles, all perfectly alike. These soon split into towers, which were shortly afterwards lost in colonnades, then ended in pines, cypresses, and other trees, even and similar. This is the *fata morgana*, which, for twenty-six years, I thought a mere fable.' The Enchanted Coast of the polar regions is another beautiful effect of refraction, and presents, according to Scoresby, the appearance of an ancient city with its ruined towers and monuments.

The Spectre of the Brocken is the shadow of the spectator himself cast upon clouds and mists. This is seen of gigantic size from the summit of the Hartz Mountains; but the following adventure of a traveller on our own Skiddaw is equally interesting:—'One of the party was a short distance in advance, when a ray of sunshine darted through the mist, and he saw a figure walking ten or fifteen yards distant from his side. Taking it for granted that this was one of his companions, whom he had supposed at some distance, he vented some expressions of disappointment; and receiving no answer, repeated, and repeated it again. Still there was no answer, though the figure kept steadily advancing with even steps. At last he stopped, half angry, and turned quite round to look at his silent companion, who did the same, but receded as he approached; and it became evident that the figure, apparently dimly seen through the mist, was his own shadow reflected on it. It was then surrounded by a bright halo, and as the light became stronger, grew less and less distinct. The rest of the party came up in time to witness this remarkable appearance, with some modification. On reaching the ridge of the mountain, our figures, of supra-human size, appeared to be projected on the mist in the direction of the Solway.'

St Elmo's Fire is a luminous meteor which appears resting upon the tops of the masts of a ship at sea, or sometimes upon the points of spears on land. Lord Napier describes it as 'a blaze of pale phosphorescent light flitting and creeping round the surface of the mast;' and this, in an intensely dark night, and accompanied by thunder and lightning, must have formed a very impressive spectacle. The fireball, though probably electrical, has never been properly accounted for. The most remarkable one on record 'occurred on the 18th August 1783, about 9 P. M., and was visible over a wide extent of Europe, from the north of Ireland to Rome, frequently changing its form and hue. It crossed the zenith at Edinburgh, and then appeared round

and well-defined, of a greenish colour, casting a shade upon the ground of a similar tint: a tail of considerable length attended it. Its aspect was much changed when seen at Greenwich; for it then looked like two bright balls, the diameter of which was about two feet, followed by others connected together by a luminous body, and finally terminating in a blaze tapering to a point: the colours of the balls were different. This was a phenomenon awfully grand! The height of the ball was estimated to be far above that usually assigned to our atmosphere; its speed was not less than 1000 miles a minute, and its diameter was computed at 2800 yards.' The fireball sometimes heralds the appearance of falling stars, a phenomenon equally mysterious: on one occasion at least a thousand of the latter fell before dawn.

The Ignis-Fatuus is supposed by some to be of electrical origin, while others suppose it to be phosphuretted hydrogen evolved in the process of decomposition. 'The suggestion of this gas,' says Dr Thomson, 'as an explanation of the meteor, recalls the chimera of sepulchral lamps perpetually burning. The sober matter-of-fact man may join the sceptic in rejecting the fable, though told by Licetus, of the unextinguishable lamp in the tomb of Pallas, the hero of the Mantuan bard, discovered about the year 800, after being shut up nearly 2000 years. Are we to accept the account of the burning lamp of Olybius, encased in its double urn; or that of Tulliola, which was said to be found burning, when, in the time of Pope Paul III., fifteen centuries after Cicero had bewailed the loss of his daughter—her sepulchre was accidentally opened? But what shall be said of Camden in the seventeenth century, or of the alleged discovery in Spain in the present era? This antiquarian and historian tells us that the vault in York, where the remains of Constantius Chlorus reposed, was violated when the monasteries were ransacked, and the sepulchral lamp was found burning, but it immediately expired! So at Bacna in Spain, near the Castellum Priscum, between Granada and Cordova, so late as August 1833, another ignited sepulchral lamp was discovered. Like the former, the flame instantly expired, and the vessel was broken from its fastenings on attempting its removal.'

We must now conclude, but for no other reason than that we have come to the end of our space. Dr Thomson's book is full of sound and entertaining instruction. Evincing extensive reading and judicious arrangement, it will be found an admirable 'Introduction' to the science of which it treats—a science consisting as yet more of detailed observations than of established principles, of description rather than of explanation. Less technical than the treatises of Daniel and Kämtz, our author's work will be especially useful to general readers, carrying them pleasantly over what is known, and referring with scrupulous fidelity to the sources from whence he has drawn his materials, or in which attempts have been made to explain the phenomena described.

CAPTAIN POSITIVE.

A FRENCH veteran with one arm was seated before the door of his neat cottage one pleasant evening in July. He was surrounded by several village lads, who with one voice intreated him to commence his promised story. The old man took his pipe from his mouth, wiped his lips with the back of his remaining hand, and began thus:—

'In my time, boys, Frenchmen would have scorned to fight with Frenchmen in the streets as they do now. No, no; when we fought, it was for the honour of France, and against her foreign enemies. Well, my story begins on the 6th of November 1812, a short time after the battle of Wiazma. We were beating a retreat, not before the Russians, for they kept at a respectful distance from our cantonments, but before the biting cold of their detestable country, more terrible to us than Russians, Austrians, and Bavarians put together. For the last few days our officers had been telling us that we were approaching Smolensko, where we should be certain of finding food,

fire, brandy, and shoes; but in the meantime we were perishing in the ice, and perpetually harassed by bands of Cossack riders.

'We had marched for six hours, without pausing to draw breath, for we knew that repose was certain death. A bitter wind hurled snow-flakes against our faces, and now and then we stumbled over the frozen corpses of our comrades. No singing or talking then! Even the grumblers ceased to complain, and that was a bad sign. I walked behind my captain: he was a short man, strongly built, rugged and severe, but brave and true as his own sword-blade. We called him Captain Positive; for, once he said a thing, so it was—no appeal—he never changed his mind. He had been wounded at Wiazna, and his usually red face was now quite pale; while the pieces of an old white handkerchief which he had wrapped round his legs were soaked with blood. I saw him first move slowly, then stagger like a drunken man, and at last he fell down like a block.

"*Morbleu!* captain," said I, bending over him, "you can't lie there."

"You see that I *can*, because I *do*," replied he, pointing to his limbs.

"Captain," said I, "you mustn't die thus;" and raising him in my arms, I managed to place him on his feet. He leaned on me, and tried to walk; but in vain: he fell once more, dragging me with him.

"Jobin," said he, "'tis all over. Just leave me here, and join your column as quickly as you can. One word before you go:—at Voreppe, near Grenoble, lives a good woman, eighty-two years old, my—my mother. Go to see her, embrace her, and tell her that—that—tell her whatever you like, but give her this purse and my cross. That's all."

"Is that all, captain?"

"I said so. Good-by, and make haste."

'Boys, I don't know how it was, but I felt two tears freezing on my cheeks.

"No, captain," cried I, "I won't leave you: either you shall come with me, or I will stay with you."

"I forbid your staying."

"Captain, you might just as well forbid a woman talking."

"If I escape, I'll punish you severely."

"You may place me under arrest then, but just now, you must let me do as I please."

"You're an insolent fellow!"

"Very likely, captain; but you must come with me."

'He bit his lips with anger, but said no more. I raised him, and placed his body across my shoulders like a sack. You may easily imagine that while bearing such a burthen I could not move as quickly as my comrades. Indeed I soon lost sight of their columns, and could perceive nothing but the white silent plain around me. I moved on, and presently there appeared a band of Cossacks galloping towards me, their lances in rest, and shouting their fiendish war-cry.

'The captain was by this time in a state of total unconsciousness, and I resolved, cost what it might, not to abandon him. I laid him on the ground, covered him with snow, and then crept under a heap of my dead comrades, leaving, however, my eyes at liberty. Soon the Cossacks reached us, and began striking with their lances right and left, while their horses trampled the bodies. Presently one of these rude beasts placed his hoof on my left arm and crushed it in pieces. Boys, I did not say a word; I did not move, save to thrust my right hand into my mouth to keep down the cry of torture; and in a few minutes the Cossacks dispersed.

'When the last of them had ridden off, I crept out and managed to disinter the captain. He showed few signs of life; nevertheless I contrived with my one hand to drag him towards a rock, which afforded a sort of shelter, and then lay down next him, wrapping my capote around us. Night was closing in, and the snow continued to fall. The last of the rearguard had long disappeared, and the only sounds that broke the silence were the whistling of distant bullets, and the nearer howling of the wolves, which were devouring the dead bodies. God knows what things were passing through my mind that night, which, I felt assured, would be my last on earth. But I remembered the prayer my mother had taught me long ago when I was a child by her side; and kneeling down, I said it fervently.

'Boys, it did me good; and always remember that sincere earnest prayer will do you good too. I felt wonderfully calm when I resumed my place next the captain. But time passed on, and I was becoming quite numbed, when I saw a party of French officers approaching. Before I had time to address them, the foremost—a low-sized man, dressed in a fur pelisse—stepped towards me, saying, "What are you doing here? Why did you stay behind your regiment?"

"For two good reasons," said I, pointing first to the captain, and then to my bleeding arm.

"The man speaks the truth, sire," said one of his followers. "I saw him marching behind the column carrying this officer on his back."

'The Emperor—for, boys, it was he!—gave me one of those looks which only himself or an Alpine eagle could give, and said, "'Tis well. You have done very well." Then opening his pelisse, he took the cross which decorated his inside green coat, and gave it me. That moment I was no longer cold or hungry, and felt no more pain in my arm than if that ill-nurtured beast had never touched it.

"Davoust," added the Emperor, addressing the gentleman who had spoken, "cause this man and his captain to be placed on one of the ammunition-wagons. Adieu!" And waving his hand towards me, he passed on.

Here the veteran paused, and resumed his pipe.

'But tell us about the cross, and what became of Captain Positive,' cried several impatient voices.

'The captain still lives, and is now a retired general. But the best of it was, that as soon as he recovered, he placed me under arrest for fifteen days, as a punishment for my breach of discipline! The circumstance reached Napoleon's ears; and after laughing heartily, he not only released me, but promoted me to be a sergeant. As to the decoration, here is the ribbon, boys: I wear that in my button-hole, but the cross I carry next my heart! And unbuttoning his coat, the veteran showed his young friends the precious relic, enveloped in a little satin bag suspended round his neck.

LEAF-GOLD AND PAPER-SHAVINGS.

Some idea may be formed of the extent of the London bookbinding trade in the nineteenth century, when we state that the *weekly* consumption of leaf-gold, enriching the exterior of books, amounts to about 3,600,000 square inches; and that the weight of paper-shavings sold annually by the London binders, cut off the edges of books, amounts to 350 tons!—*Illustrated Historic Times*.

The present number of the Journal completes the eleventh volume (new series), for which a title-page and index have been prepared, and may be had of the publishers and their agents.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF 'CHAMBERS'S INFORMATION FOR THE PEOPLE,' 'CHAMBERS'S EDUCATIONAL COURSE,' &c.

No. 288. NEW SERIES.

SATURDAY, JULY 7, 1849.

PRICE 11d.

WORTH OF THE PRESENT.

IN the record of his Journey to the Western Isles, Samuel Johnson, among other reflections made on landing at Iona, gives us the following characteristic sentence:—'Whatever withdraws us from the power of our senses, whatever makes the past, the distant, or the future predominate over the present, advances us in the dignity of thinking beings.' In various shapes, and under different turns of phraseology, we may meet with a similar cast of thought in almost all the professedly-reflective writings of the eighteenth century. There is a constant proneness to undervalue the passing day, and to consider time as interesting and significant only in its past and future relations. Such a tendency is doubtless inherent in human nature, and has an appropriate function to fulfil in the general economy of things. In the contemplation of the past resides one of the purest and most affecting kinds of poetry, while the looking forward to the future is connected with aspirations in which there is much to purify and refine. It is, however, more than questionable if the present should be held as so devoid of these ennobling characteristics as to require to be degraded below either past or future time.

If Johnson's aphorism were true, the fond musings of the poet over the romantic barbarisms of early ages, the prepossessions of foolish politicians in favour of what they call the wisdom of our ancestors, the dreams of the castle-builder, and the arguments of the procrastinator, would all be supreme rationality. All efforts to give a just economy to the passing hour, and to secure the means of ministering to our daily enjoyments and necessities, would want the respectability which common sense attaches to them. Seen in this light, we readily detect the fallacy of the saying—that is to say, its over-statement of the truth. It were well to ascertain, if possible, how Johnson, who was not a man to write anything which he did not believe to be true, should have been led into uttering so flimsy a sophism. No error, it has been said, can be properly refuted, unless we place ourselves in the position of the erring party, and from thence perceive how, and under what conditions, his mistake originated. Now Johnson, though a man of commanding intellect, and in other respects sufficiently capable of thinking soundly, was nevertheless, like every other writer, necessarily and unconsciously influenced by the temper of the times in which he lived, and accordingly his views naturally partook of the current tendencies of thought. The age he lived in was remarkable for nothing more than for its want of faith in man. It did not recognise nobleness as an inherent quality of the soul, which, with every opportunity for action, might reveal itself in beneficent facts or exalted efforts, conformably to the

general laws of life, and thus announce the relations of human purpose with the universal aims of principles; but it sought to deduce its conceptions of duty from the casual and accidental phases of external prosperity, and reckoned only that virtuous which could exhibit the signs of a material success. Thus men were temporarily deprived of those everlasting sanctions which once made heroism and a severe virtue possible, and surrounded life with awful and beautiful obligations. With this degradation of the scope and ends of existence, all existence assumed an aspect of meanness and triviality, and to the eyes of a wise man naturally looked contemptible. Life, as men lived, had only a paltry and ephemeral significance, and afforded no possibilities of activity answerable to the aspirations of the gifted and earnest minds which in all ages appear among mankind. Only in 'the past, the distant, and the future,' could these contemplate the realisation of their soul's exalted dream. It *had* been realised in the olden primitive days, when men felt themselves related by an unspeakable mystic wonder with invisible realities; it *would* be realised again, when men should have learned science in love, and, through new stages of inquiry, recovered the simplicity of spirit which a presumptuous scepticism had obliterated: but it was not capable of being realised *here and now*, because of the inevitable baseness of the present time, and of the littleness of the pursuits of existing men. Hence the past and the future would be invested with a sacredness which the present did not reveal, and the dignity of human nature would seem standing in abeyance. To a stern reflective moralist, looking with a profound pity on the low and trivial concerns wherein men for the most part seemed engaged, and finding in his own heart some prophecy of better things, it might naturally enough seem wise to escape, if possible, from the bondage of prevailing customs, and to assert the freer dignity of man by a habitual commemoration of his nobler achievements in former times, or in contemplations of the unborn grandeur of his fate, which the future might be expected to make manifest. Thus the intrinsic purport of Johnson's saying might perhaps, to his own mind, be even this:—Let not life be consumed and wasted utterly in such poor enjoyments as the passing day affords you, but know that man's powers and responsibilities are linked with the infinity of things—that of old men made their lives sublime, and that the promise of futurity is nothing less than a continual advancement. Ponder well the record of the heroic energies which worked so successfully in the past, and admire this boundless realm of possibility which stretches yet before you onwards to the utmost boundaries of time; and the capacities and desires of your souls shall be thereby quickened and expanded, and you shall be elevated in the rank of 'thinking beings.'

Whether Johnson was aware of this enlarged meaning of his words, or had no apprehension that they could be so interpreted, is of little moment to the purpose now in hand. It is enough that this, or something like it, was probably the latent sense which he struggled to express. So considered, the words convey a measure of obvious, though not very striking truth; which, however, being once perceived and admitted, we can the more readily understand the actual deficiencies of the writer's insight. It is a clear case of limitation. It is true enough, as he apparently wished to say, that when men are immersed in purely frivolous pursuits, their minds may be enlightened and entertained by the act of bringing imaginatively before them the high accomplishments of earlier and better eras, or by prefiguring to themselves the ulterior developments of an advanced system of society; but it shows a very imperfect appreciation of the capabilities and needs of man to eject the present from our thoughts by a too habitual and exclusive veneration for the past and future, since over the first of these we can have no possible control, and can influence the other only by what we now actually perform.

A juster view of life would lead us to recognise the present as the sole possession of time with which we are practically and specially concerned. 'Work while it is called to-day' is one of the wisest of all possible injunctions. The past ought doubtless to be contemplated for the significant experiences it will yield us: the historical glories and catastrophes of the olden time, with whatsoever interest and warning they may have, need to be effectually studied by the living, inasmuch as they afford instructions for their own life-voyage of discovery. The future, too, which for ever looms brilliantly, if often delusively, before us, has a perennial and inevitable charm for the imagination; and, as a land of perpetual promise, is linked intimately with our sympathies and hopes. The past and future have a historical and prophetic connection with the present, and therefore can never be severed from the regards and considerations of men. But the present alone is the available field and workshop of our actual performances. The hour that now is, is the element wherein we are ordained to live, and out of it we have to unfold the possibilities of our destination. It is the point which visibly connects us with the boundless contingencies of universal being. We build our fate out of the rough materials which every day hurls confusedly around us. From a rude unshapen mass of capability, it is our appointed task to rear the temple of a manly and worthy life. Time, thoughtfully considered, is as earnest and awful as eternity. It is indeed eternity in the vesture of an hour—a visible revelation of the infinite continuity, disclosed to us under finite limitations; a divergent ray of duration, under an aspect of mortal circumstance. Not lightly should a man esteem this fleeting phenomenon called to-day. Under the lowest consideration, it is the outcome of all preceding generations; and with its chequered sunshine and gloom it is ours even now to work in with faithfulness and courage. Gird well thy heart with integrity and strong endeavour, and put the stamp of an everlasting emphasis upon whatsoever duty thou canst find to do; for every act and effort of a man is charged with an abiding force whose vitality is never quenched, but visibly or imperceptibly circulates for evermore.

It is only by a constant faith in the sacredness of the present that life can be effectually ennobled. Let us understand the pre-eminent worth of the living time, and learn to solemnise our lives by large and universal aims, that shall embody the sublime suggestions which the future prefigures to our belief, in noble and commanding deeds and institutions, such as may be left, without apology or regret, to take their place hereafter among the memorials of the past. If men would take life earnestly, it would never appear mean. Could they sincerely believe themselves accountable to the universe for the fit employment of their powers, and that the

whole creation is wronged by any baseness or craven fear, and that it is blessed and benefited to the like extent by every stroke of rectitude, by every breath of love, they would deem their activity of some account, and regard the transient common moments as consecrated time. He who cannot, with a proud reliance on its sufficiency, accept the duty which the day brings to him, and throw some grace of truthfulness over the meanest occupation he may have, will never be qualified to perform successfully any greater or more honourable work. And never to any man shall time, under any of its remoter aspects, disclose its truly grand and complete significance, unless a sense of its present significance has been in him already consciously developed. Whoever would faithfully fulfil the measure of his destiny, let him dwell in the hour that now is, in the earnest experience of every day. Here let him cherish lofty and noble thoughts, and dare to perform great and magnanimous actions. If this hour suffice him not for all the purposes of manly and earnest living, there is small likelihood that any other hour would suit him better. Postpone not thy life. Stand where thou art, and work manfully towards thy ends. So shall thy life be profitable to thee; so shall it be as a stream of welcome tendency, bearing thee bravely onwards to serenest satisfactions—to quiet and sufficing joys.

PADDY THE TINKER.

A VERY few years since a poor family residing in the suburbs of Omagh in the county of Tyrone attracted much notice. The adventure which caused it found its way to the local journals; and the details as repeated, though varying in some points, agreed in the main circumstances of the story. A friend, who spent some time in the neighbourhood, favoured us with such particulars as he could gather, and which probably comprise the true version of the affair.

The Callaghans—who are a large family—live in a cabin by the wayside at some distance from the town. People wondered how so many found room within its narrow walls; but they not only found room, but content and cheerfulness. And those who passed the door often heard the sound of pleasant voices and merry laughter, chiming in with the clatter of tins and the tinker's hammer: for it was the tinkering trade which gave support and occupation to those within. Those who were too young to be initiated into the mysteries of the craft, could at least wipe the dust from the pots and pans, and make them look bright and clean. The donkey, who drew these precious articles to distant parts of the neighbourhood and to country fairs, was an object of respect and love to the whole family. His lodgings were in the far corner of the cabin—which was portioned off by a ledge of wood—where he was duly cared for by the elders of the family, and fondly caressed by the youngsters. As he passed along on the winding road of a fine sunny morning, the glittering of the tins might be seen as they flashed through the green hedges. Sometimes his master walked by the side of the little cart, encouraging the patient beast with familiar words. When a shawl for herself, a cap for Micky or Jack, or any article of dress for some member of the family, was to be got in exchange for a kettle or a saucepan, Mrs Callaghan took her husband's place: nor did she ever forget in her mercantile transactions to secure some tobacco for her goodman. Paddy, their first-born, and his mother's special darling, was sometimes deputed to attend the fairs; and Mrs Callaghan declared that he made larger sales and better bargains than she or his father could. It was no wonder that Paddy got customers; for he was, as all the neighbours allowed, 'a likely boy, and had a pleasant word for every one; and so much fun, that he'd make a cat laugh.' Indeed frolic and laughter were always to be had in his company. Besides his convivial talents, Paddy had a decided genius for tinkering; and his copies of some of his father's

chefs d'œuvres were so exact, that it was difficult to distinguish them from the originals. It was not to be supposed that a person so endowed, and of such social propensities, should not join in such amusements as offered. It must be confessed that he, like many other gifted men, left many of his works unfinished, so often was he tempted beyond the domestic circle. He was a guest at all the dances and the weddings in the neighbourhood; and there was not a girl of the party who did not wish to have Paddy for her partner; for if he was merry at other times, he was almost out of his wits with spirits when dancing a jig.

It was one morning after he had returned from one of those merry meetings that Paddy called his mother aside, and told her that he had offered himself to Nancy Maguire, and been accepted. It was in a thoughtless moment that poor Paddy had proffered his heart and hand; but it must be confessed that his thoughtless moments were neither few nor far between; seeing that they generally continued from the time he opened his eyes in the morning till he closed them at night. The news was anything but pleasant to his mother, particularly as she found that Paddy was to leave her, and set up for himself in Maguire's cabin; which was to be given up, rent free, to him and Nancy, by her father, who meant to settle a few miles farther on. Considering Paddy's great talents, and his high reputation for tinkering, Mrs Callaghan looked on the whole affair as a take-in on the part of the Maguires. She thought, too, that the girl might go gadding about; but, after all, that would have made her the fitter for a tinker's wife. Paddy only knew that she was pretty, and could dance a jig right well; and he hoped all the rest. He left his home with a sigh; for though it was but a mud cabin, he loved it dearly. His father resolved that he should have an equivalent for the cabin; so bestowed on him a supply of sheet-iron, and the necessary tools for working at his business. He was soon settled in his new abode with his pretty little wife, and it was not his fault if they were not always good-humoured and gay. Some folks, however, said that Nancy was better tempered at a wedding or a dance than she was at home; and others went so far as to say that she never gave Paddy an easy minute, but that *she was ever at him*. Nancy's friends told a different story; and said that if the girl thwarted and snubbed him, it was all out of good-nature, and for his good. Constant dropping, they say, wears the smoothest stone, and however it was, poor Paddy lost all his fine spirits; and his eyes, that used to be for ever dancing in his head, looked dull and heavy; and instead of the *hop, skip, and jump* which had distinguished his gait, he now moved listlessly on, as if it was all one to him where he went. It was said that he had on two or three occasions threatened to go away for good; but Nancy, let matters have been how they might, would have been sorry if he had parted in anger.

'What is come over our Paddy?' Mrs Callaghan said to his father. 'He's not the same boy he was—the half of him aint in it—and his cheeks, that were like the reddest roses I ever seen, have no more colour in them than the drivellin' snows; and no jokes and laughs any more. I'm afraid of my life that Nancy has a contrary temper; and he is one that never was come across since the day he was born—one that was used to have his own way in anything he'd take into his head; from the first moment that he could use his little fists, and came to his natural speech.'

'Maybe,' replied her husband, 'his sheet-iron is out; but that needn't trouble the boy, for I'll share what I have with him.'

One day, as Mrs Callaghan was sitting on the low stool by the fire, and the bellows with which she had been blowing it lying on her lap, Paddy walked in, and passed by the children, who were standing about the door, without speaking. He went over to the fire, and drew the other stool, and sat down by his mother.

'Mother,' said he, after a moment's silence, 'I'm come to bid yees all good-by; for I can't put up with Nancy's tongue no longer—it's beyond the beyonds: she's all out too cantankerous: the very heart's fairly scalded in me. So I think it better to go quiet and aisy at onst; and so I have listed with the party that's baitin' up for recruits; and I'm come to lave my blessin' with yees all, mother darlint'—'

His poor mother burst into violent fits of crying; and Paddy's eyes, which had been full when he entered the room, overflowed, and the big tears rolled down his cheeks: the children all hung about him, and with sobs joined their intreaties to their mother's that he would not leave them. But Paddy could not go back of his engagement, and go he must. It was a sorrowful parting to them all. He never had been longer from home than for a few days, when he happened to go with a cargo of tins to a place too distant to admit of his return on the same day. On these occasions he was always missed, and his return eagerly watched for by the whole family: the children would be up and away at the first dawn of day to look for him from the point which commanded the most extensive view of the road. There would they remain, straining their eyes, till the donkey-car, with Paddy by its side, came in sight; then, with shouts, they would bound on to meet him. And now he was to go beyond the seas—perhaps to foreign parts, and might stay away for years upon years; and if he did come back, he might find the green grass growing over those who would have been the most delighted to give him the *Cead mille failta*. It was thus the poor mother thought; but all couldn't keep him. He shared his bounty with his parents; but the money looked hateful in the eyes of his mother. A few days, and he was away with the party with whom he had enlisted. None grieved more after him than his wife; for she blamed herself, and thought that he would not have left her if she had not been too cross. She feared to call on his people, for she felt that they were angry with her; and so left the neighbourhood without seeing them, and went to stay with her father. The cabin in which she and Paddy had lived was soon inhabited by other inmates. Paddy's mother fretted sorely after him—and she was for ever talking of him. She never wearied of telling of all the arch ways and 'cute remarks of his boyish days. The neighbours heard the stories so often, that they had them by heart. Every one observed, from this time, what a favourite little Jack was with his mother; he was like what Paddy had been at his age, and he was always by her side.

Paddy liked a soldier's life at first, when it was new to him; but its monotony after a time tired him. He felt as if one sight of the green fields, and the little mountain rill at home, would do him good. The very cabin, humble as it was, seemed to his fancy, in the distance, a very paradise. Vague longings to return, it is said, at length formed themselves into regular plans; and in the third year of his service, we have heard, he did actually desert.

It would lead us into too great length were we to detail all that he suffered in his vain endeavours to reach home; all the harassing expedients to which he was driven to elude the police, who were on the lookout for deserters, and who, he had often reason to think, were on his track; the days of concealment, and the nights of watching; or, if slumber came, the troubled dreams, in which grim-visaged police and fiendish drum-majors were sure to present themselves in the most appalling attitudes. To escape from this wretched state he intreated the aid of an uncle, in whose house in Clogher he had sought refuge. His uncle applied to the Roman Catholic bishop, who, through the instrumentality of an officer very high in the army—to whom he had once rendered an essential service—effected all that was required, and Paddy was extricated from his perilous situation, on condition of his immediately returning to quarters. Arrived there, he must have thought himself very fortunate in being let off with a good scolding, and a few

days' retirement in the black hole. To do him justice, after his probation he showed himself grateful for the lenity he had experienced; and by the strictest attention to his duty, proved how anxious he was to reinstate himself in the good opinion of his officers. After serving for another year, he got his discharge; and now he might go home with an easy conscience, and free from all anxiety. He took a kind farewell of the comrades whom he had before left with so little ceremony. His excitement and hurry to reach home were very great: he took passage in the first vessel which he found bound for Ireland. Unfortunately, she was not sea-worthy, and he narrowly escaped being wrecked. They found much difficulty in reaching the port; and poor Paddy was so worn out by his exertions in assisting at the pumps, that a little rest would have been necessary; but the moment he put his foot upon his native soil his heart got up, and slinging his worldly goods, which were tied up in a blue and white handkerchief, on his stick, which he rested on his shoulder in musket-fashion, he set out in double-quick time, singing and whistling snatches of merry songs for the first two or three miles, and thinking of the joy with which he would be greeted on his unexpected arrival, especially by his poor mother. But his limbs grew weary, and his hands and feet burned with heat; his head ached; and he was tormented with parching thirst. He put up on his way for the night at a little shebeen shop (so are the humble houses of entertainment designated); but he could partake of none of the good cheer spread before him; the smoking dish of potatoes, and the tempting rashers of bacon and fried eggs, utterly failing in provoking his appetite. The bed to which he retired was no resting-place to him, for he rose from it in the morning guiltless of a slumber. The people of the house saw that he was ill; but he said *the air would do him good*. So he paid his reckoning for the dinner which he had not tasted, and for the bed in which he had not slept, and pursued his way. He was indeed ill; and how he ever reached his uncle's house was wonderful.

The pleasure which his relations felt at seeing him come back his own master, was subdued when they saw how weak and ill he appeared. They, however, gave him a hearty welcome: he sat shivering and cowering over the fire, complaining of the cold, though his face was flushed, and his hand was burning. He lay upon the bed; but sleep would not come: the headache and thirst increased. His uncle and aunt whispered that it was the *sickness* which he had (the term always used to express fever). They imparted their fears to him in the morning; spoke of their dread of infection, and proposed his removal to the hospital of the workhouse. Paddy acquiesced in the propriety of the measure; and he was accordingly brought there, and instantly put to bed, which, from the crowded state of the establishment, was shared with another fever patient. The fever ran high, and bad symptoms came on. On the eighth day his case was pronounced to be hopeless; and at his earnest request a messenger was sent to tell his parents that he was in Clogher—ill, and in hospital. What would have been such joyful news to his family, who had no expectation of his coming back, was embittered by the account of his illness; but he was young, and had always been strong and healthy; so they hoped he would soon be well, and among them once more. It was resolved that his father and his favourite sister Peggy should go to see him, and bring him back on the donkey-car, if he could be removed with safety. The poor mother stayed at home, to take care of the cabin and of the children; she stayed at the door till the travellers were out of sight; she offered up an earnest prayer for Paddy's recovery, and safe return with his father and sister.

The way seemed long to them, who burned with impatience to see him. At length they arrived at the house of their relations: the accounts of poor Paddy were most disheartening; he was so much worse, that his death was every moment expected. His father and

sister gained admittance to the ward: he was ill indeed; and they wept bitterly when they looked at him. His eyes were directed towards the door; and, after a moment, he hid his face in the bedclothes, exclaiming, 'Why didn't my mother come to see me?' His father and Peggy caressed him, and wept over him; but still he would interrupt their fond words with, 'Why didn't my mother come to see me?' These were the last words they heard him speak, as they left the ward at the hour prescribed for visitors to take their leave. They were at the door at daybreak the next morning, when they learned, what they most dreaded to hear, that poor Paddy had died at twelve o'clock the night before. From the nature of the complaint—which made every precaution for the prevention of the spread of infection necessary—but a few hours had been allowed to pass till the remains were consigned to a coffin. The grief of the father and the girl affected those who witnessed it; and the earnest request, that they might be allowed to take poor Paddy's remains home to his own burying-place, was complied with; and the coffin was placed in the donkey-car. Bitter were the tears which Callaghan shed as he adjusted it, and covered it with straw, that it might not shock the eyes of the poor woman at home, till the sad news was broken to her.

In the meantime she had cleaned up the cabin, and put everything in order. She made the bed as comfortable as she could for her darling, having fixed on the snugest corner for his resting-place; 'for wake and weary my poor child will be,' she said, as she made all her little arrangements. She had made some purchases for the jubilee which she was determined to have to welcome him. The tea and sugar, and the bread and butter, were all ready on the shelf for a refreshing repast. The sound of every distant car, and the bark of every dog, brought her to the cabin door. At length, nearly at nightfall, she caught a glimpse of a car and persons walking by its side. She called to the children within to blow up the fire, and to make a good blaze. She soon ascertained that the travellers were her own people; but Paddy was not with them. She tried to comfort herself for the disappointment which she felt by saying, 'It was better not to bring the dear creature so far, till he gathers a little strength; and the night-air, sure enough, might give him *could*. But it won't be long till he comes to; for sickness never lay heavy upon him.' When they reached the door, she perceived by the face of her husband that something was amiss; and when she looked at Peggy, she saw that her eyes were red, as if she had been crying. She feared to ask what was the matter: but the sad tale was soon told; and the coffin was laid upon a table, and the poor mother knelt by it, wringing her hands, and calling Paddy by the fondest epithets; and telling the poor lifeless clay how she loved him; and asking why he had parted from her. Her husband tried to calm her; but the words of comfort which he spoke fell coldly on her ear, and did not reach her heart. Paddy, wild and thoughtless as he had been, had always been the joy of *that* heart. It was agony to think she was never to see *him* again who had been the very light of her eyes! She asked for any message he might have sent—for every word that he had spoken. They repeated his last words, 'Why didn't my mother come to see me?' They cut her to the very heart, and seemed as if they would for ever mar any hope of peace; for, while they spoke of his love, they told too plainly that he had felt her neglect. Oh how she accused herself for having let anything on earth detain her away from him at such a time! 'Why didn't my mother come to see me?' seemed for ever to ring in her ears, and vibrate through her very heart—'Why didn't my mother come to see me?'

The remains were borne the next day to the quiet old churchyard about two miles off, and were followed by a great concourse of persons; for all the neighbours wished to pay the last mark of respect to

one who had been born and bred among them, and who had been so well liked; and as they walked along, many were the anecdotes of his good-nature and pleasantry which were recounted. It was with difficulty that the friends, who had lingered behind the rest, could prevail on the poor mother to leave the grave, on which she had thrown herself in wild agony. A few days more, and she might be seen about her usual occupations. The poor cannot afford to indulge their grief; but still, as they go about their business, it lies heavy at their heart; and though they cannot sit apart for hours and days, and let their tears flow on without restraint, yet they find time in all their active hurry for passionate bursts of agony.

The poor mother might still often be seen wending her way with her cargo of tins to some neighbouring fair or market. Many an object that she had been wont to pass heedlessly by, told stories of other days that wrung her heart. As she passed the rich pasture-lands, and heard the tinkling of the sheep-bells, she remembered how often Paddy, who was ever at her side when a child, would make her stop, that he might dance to their merry chime. The very primroses, glinting out on the green banks, seemed too beautiful and sweet, now that Paddy, who loved to gather them when a boy, was gone. The little birds, chirping and hopping gaily among the green branches, seemed, as it were, too happy without him, who was wont to seek out their nests and attend the young brood. She would sometimes stop on her way and let the donkey feed by the roadside, while she sat near the hedge to think of Paddy; and she would clasp her hands, and utter vehement cries, and exclaim, 'Why didn't my mother come to see me?' Strangers who went along thought she was some poor demented creature, and passed on to the other side. The neighbours knew it was grief that ailed her, and pitied her the more because they thought that she was crazed. As she sat thus one day, she might have heard the step of one close by, if she had heeded anything. A trembling hand was laid upon her shoulder, and in a tone, low almost as a whisper, Nancy—Paddy's wife—said, 'Wont you turn round? Wont you give me one kiss?' She did turn round, but it was to give an angry look; for she blamed her for his having gone away. The poor girl said no more; but gathering the end of the mother's cloak in her hand, she kissed it passionately, and went on her way. After a moment, the unhappy woman thought she had been too harsh, and she called after her; but Nancy had hurried on, and was already far out of hearing: and this, too, weighed upon her heart; and so months passed on.

One evening when she had returned late from market she sat down to reckon her gains. She was weary after her long day's journey; but she did not neglect to see that the poor *dumb baste* was comfortable. He was in his own corner of the cabin, and the children were busy about him. The dusk of the evening had come on, and the blaze from the turf-fire was not strong, so the cabin was rather dark and gloomy. The latch of the door was raised, and those within thought it was by the goodman of the house, who was expected home about that hour; but it was a stranger who entered. He said nothing, but went over to the fire, drew a stool, and sat down; and having taken a pipe from his waistcoat pocket, lit it, and applied himself intently to smoke. Mrs Callaghan concluded that he meant to pass the night there, as it is very usual for wayfarers at nightfall to turn into the cabins by the wayside to seek a night's lodging. The required hospitality is seldom refused, except in cases where there is sickness within, or too many in the family to admit of room for another. The latter being the case in Callaghan's cabin, his wife told the unbidden guest that she would give him a night's lodging and welcome if there were room; but added, as she pointed to the group of children, that they were too many, and advised the traveller to push on to the next house, which was not far, and where there was plenty of room. As he made no reply, she concluded that he

had not heard her, and repeated what she had said. After a dense whiff from his pipe, he merely said he was very well where he was, and did not mean to go farther, and then resumed his smoking with increased energy. The unwilling hostess felt a little alarmed, lest he should be one of those bad characters who sometimes intruded into houses with a design of robbing the inmates. She wished most anxiously for Callaghan's return, as she did not know how to act by a person who appeared determined to have his own way. The children looked frightened, and stood motionless, observing the intruder: little Mary, summoning up her courage, came from among them, and went to the obscure corner where he sat, that she might take an accurate survey of his features: when she got close to him, and looked up in his face, she called out, 'Mammy, it's our own Paddy!'

The poor woman rushed over, took one look, and fell to the floor in a state of insensibility. The children raised her; but she had not quite come to herself when her husband entered: the children ran to him, exclaiming, 'That's our Paddy!' as they pointed to the man, who went on smoking at the fire.

Callaghan looked at the man, and ran in terror for protection behind the donkey. 'Don't go nigh it, childer—it's a speret: don't go nigh it.' Then turning to the donkey, he inquired of him, 'Wasn't it you that brought home our Paddy from Clogher hospital? Wasn't it yourself that drew the cart with his coffin and himself in it all the ways? Hadn't we a wake, though he was shut in it? Didn't we lay out every pinny we had to buy candles, and pipes, and tobacco, and all that was right and requisite? And didn't all the neighbours come? And hadn't they a pleasant night? And didn't they all go to the funeral? And didn't we lave him with his own people, that had been there for these hundreds of years? And what is it, then, that can make his speret unaisy?'

The donkey denied nothing that his master asserted; but was perhaps unable to answer the last query, as he still remained silent.

'Oh, Paddy, darlint!' exclaimed Mrs Callaghan, 'what is it disturbs you out of your grave? Is it more masses you want for the repose of your poor soul? Sure if it is, you have only to spake the word; and if every screed in the house was to go to the pawn-office, it shall be done.'

Taking the pipe deliberately out of his mouth, the man or spirit rose, and came forward into the middle of the room, and waving his hand, said, 'I am Paddy!—Paddy sure enough; and though I've made my ways to yees, it's only to tell yees all my mind, and to go away for good and all: for I don't feel mighty well plaised with any of yees. Mother, you never came nigh me at all, though you heard I was so bad in the hospital, and that the doctors had given me up. Why didn't you come to see me? Father, you and Peggy seen me dyin' in my bid, and left me there, and never asked for a sight of me again. You wouldn't have sarved a dog so. There was I left; and the comrade that was in the bid with me died by my side that very night you seen me. He was put in his coffin, and his friends came next mornin' and took him away. I suppose yees all thought I was dead, and thrown out upon some dunghill, and that you had fairly got shot of me for the rest of your days. But you see I've come back to tell you my mind, and to say to yees all that I never will darken your doors again after your unkind tratement. But I lave yees my blessin'—'

Paddy would have gone out, but they all clung to him. Everything was soon cleared up by the explanation which took place. Paddy's father had brought home the remains of the poor man who had died, and who had been supposed by the nurses to have been his son. He had been wept over and waked by strangers, attended to the grave by those who had never seen him, and laid with those with whom he had never claimed kindred or friendship.

Paddy and his mother were in each other's arms crying for joy. His father was by his side, and the children gathered round him, laughing and crying by turns. An hour had scarcely passed, when Nancy, who had been on her way home with some purchases for her father and mother, heard the strange report, and rushed into the cabin in breathless haste. Paddy's arms and heart were open to receive her, and she wept for a moment in silence on his bosom; then looking up in his face, she said, 'I have got you back, Paddy, and you will never leave me again: never will a cross or contrary word pass my lips any more.'

'And as for myself,' said Paddy, 'I was all out too careless and too fond of rovin'; but I have more sinse now; and now that I'm back with yeels all again, I'll never lave you while the breath's in me.'

No friends ever came to look after the man who had been buried in Paddy's stead.

'We'll, let him stay where he is, the poor lonely stranger,' said Mrs Callaghan; 'for never again will I be the one to turn out livin' or dead. Wasn't I near turnin' out our darlint Paddy from his own natural home the night he came back to make us all so happy!'

WHO ARE THE HUNGARIANS?

THIS is a question which has been frequently asked of late; and the present article—if so inspiring a subject may be handled with the due avoidance of political excitement, and matters of historical fact tolerated—is an attempt to answer it.*

The inhabitants of Hungary—which term generally includes Transylvania and Croatia—comprise several distinct races: the central districts are occupied by the Magyars, with Wallacks to the east; Slovaks on the north; and Croats to the south. The two latter are Slavonians or Slaves by origin, being descendants of the Illyrians and Isheks, and, with the Pannonians, had cultivated the faithful soil from the earliest ages until the Magyar invasion. The Wallacks were a tribe that had replaced the Dacians, exterminated by Trajan in the days when Rome stretched her mighty arms to the remotest corners of Europe.

The Magyars, or Hungarians Proper, though of the same stock, are not the same barbarian Huns of whom we used to read in our schoolboy-days as issuing from their Mongolian wilds, devastating and terrorising in their march westwards, even to the very walls of Rome. This division wandered over various parts of Europe before approaching the Danube; and soon after the days of Attila, a colony distinguished for bravery established themselves at the eastern extremity of the Carpathians, under the name of Szeklers (petty Scythians). They were followed by others under Arpad—a chief still famous in the national annals, from the sixth to the ninth centuries—until the whole territory was subjugated; and afterwards consolidated by the wise policy of King Stephen, whose crown is regarded by Hungarians of all classes, even at the present day, with the most fervid reverence. Animated by a restless warlike spirit, the Magyars were continually making inroads on the lands of their neighbours: but not with impunity; for in the sixteenth century they were totally defeated in a tremendous battle at Mohacs by Sultan Soliman, a reverse of which no Magyar can speak without mingled feelings of grief and shame. So disastrous was the result, that partly by constraint, and partly by treachery, they were led to place themselves under the protection of Austria—a proceeding more fatal to their liberties and welfare than the Turkish victory. The emperors of Austria became kings of Hungary, but with no other legal powers than those recognised by the constitution of the kingdom. The

great object, however, of the government at Vienna was to Germanise the Magyars as much as possible; and for a time the result proved according to wish. By an edict of the Emperor Joseph II., German was substituted for Latin—which had been, and still was, until recently, the political language of Hungary. The Magyars resisted this encroachment, and made an attempt to found the Hungarian Academy, for the cultivation and diffusion of their native tongue, which, they contended, was as well adapted for all purposes of literature and polity as that forced on them by authority. They would speak neither Latin nor German, but Magyar; and the Latin name of their country—now inapplicable—should be changed to Magyarie. But Joseph pushed his reforms with a high hand; he even caused the national stamp to be disused—an apparently insignificant act, but one which had the effect of strengthening the resistance opposed to him. Hence the origin of the Magyar movement, which has continued down to our own days, and whose aim is to give a unity of action to the different races by whom the soil of Hungary is occupied.

After Joseph's death, when a new generation of Magyars had arisen, they pushed their claims with so much energy, as to regain a portion of the constitutional rights of which they had too long been deprived. Their views comprehended no throwing off of allegiance with regard to Austria: they desired only that old-standing treaties should be adhered to; that as a limited monarchy theirs should be a free nationality under the crown of St Stephen worn by the emperor. But their demands or remonstrances were systematically evaded; messages from the Diet were either not answered, or treated as the communications of rebels. They had nothing for it but to oppose a persevering aim to the caprices of a government which sought to overcome practical difficulties by fanciful theories—to coerce mind as the best mode of satisfying its aspirations.

The national pride of the Magyar is extraordinary—surpassing that of the Spaniard or the Scottish Highlander of olden time. A peasant clad in a greasy sheepskin will tell you the Magyars are the greatest among nations; their language the most harmonious, being, in fact, the medium through which Divine revelation was vouchsafed to mortals; and that the national costume is perpetually worn in heaven. Yet the condition of these peasants is almost identical with that of the Anglo-Saxon serfs in the eleventh and twelfth centuries.

The population was divided into three classes—we say *was*, for reasons which will presently appear: the magnates, or chief nobles, who, among other privileges, were exempt from all payment of taxes; the *bocskoros nemesek*, sandalled or peasant nobles, a class which in intelligence and education scarcely differed from other cultivators of the soil, yet they had a share in the representation of the country, besides certain immunities, one of which was, as stated by Mr Köhl, that 'they could not be hanged like other people for any crime they might commit, for it is their privilege to be beheaded, and to have their hands tied before instead of behind the back.' In common with the magnates, too, a peasant noble could walk across the magnificent suspension-bridge at Pesth, or any other taxed thoroughfare, without paying the toll; while his less fortunate neighbour, between whose appearance and his own scarce a difference could be detected, would be compelled to pay the charge. Last came the peasants, designated *corvéable*, which means that whether they pleased or no, they had to bear all sorts of burthens for everybody else: they had first to work for the support of themselves and families, then to pay all the taxes and tolls, to keep the roads and bridges in repair all over the kingdom, to furnish the nobles and other travellers with horses for their vehicles when travelling, and to forego the enjoyment of all political rights. It is difficult to believe in the existence of such a state of things, the evils of which must always be painfully

* The Editors, being unable to pronounce any opinion of their own on the question between Hungary and Austria, desire that the present article, which they insert on account of its information, should be regarded as representing only the views of its author.

obvious. As may be expected, as little trouble as possible was taken in mending roads and bridges; each peasant threw down his quota of material without regard to its fitness for the purpose: thus the roads mostly took care of themselves; bridges would sometimes be altogether wanting; and the casualties of travelling in Hungary were reckoned at 'a risk a mile.' Had not nature been as bountiful to the land as man was perverse, the peasant class must long ago have perished.

Happily for lord and vassal, feudalism and serfdom are becoming matter of history: the one may now aspire, while to the other remains the noble duty of guiding and fructifying the aspiration. Here will be a new claim to our notice; yet apart from this, there is much in Hungary that commends itself especially to English sympathies. Of all continental nations, they perhaps approach the nearest to ourselves in general character; and though we have seldom bestowed a thought on them, England and her literature have long been objects of their attention. They are not unwilling to be influenced by exterior experiences; and looking abroad over Western Europe, as observed by a French writer, M. Desprez—'It is to England they address themselves. The parliamentary institutions, the division of the two countries into counties, the resemblance of the Chamber of the Magnates to that of the Lords, and of the Elective Chamber to the Commons—all these coincidences naturally attract the attention of the Magyars. Yet even among the more enlightened there would probably be a persuasion of the superiority of their race to that of the Anglo-Saxon. Still they admire English society the more because it resembles theirs; they study English politics with eagerness, following the course of events in their newspapers; they write learned works, in which British institutions are compared to theirs, not without showing that the political forms of Hungary are simpler, closer to tradition, than those of England. Besides, political life among the Magyars assumes instinctively or purposely the habits and usages of English life. Their casinos may rank as clubs; the leading orators are fêted and feasted by their partisans, and on great occasions take part in public meetings, and sometimes they harangue the multitude from balcony or hustings. Some among them have obtained the name of the O'Connell of Hungary. In fine, when the Magyars wish to give a prompt estimate of themselves to a traveller unacquainted with them, they do not hesitate to call themselves English of the East.'

As above indicated, the Diet, or Parliament of Hungary, consists of two assemblies, the institution of which is nearly contemporary with our own, being only five years later. As Miss Pardoe writes—'It was strange and startling to remember, that within nine hours' journey of Vienna—surrounded by absolute governments like those of Austria, Turkey, and Russia, the iron link being broken only by the frontier of ruined Poland, standing like a sign and a warning to the nations—a race still existed who had resolutely flung the yoke of despotism from their necks, and dared, despite the intrigues of cabinets and the threats of power, to assert their rights.'

Such, however, is the Hungarian Diet which met at Presburg. As before observed, it consists of two assemblies, numbering—recent changes apart—six hundred members, of which two hundred form the Upper House, or Table—Upper and Lower Table being the terms used. The former sits by right; the latter is elective, and triennial. All motions originate with the Lower Table, but are first discussed at what is called a 'circular meeting.' Respectably-dressed persons are admitted to the body of the hall as well as the galleries, and are permitted to applaud when anything is said which they consider worthy the honour. The author above quoted gives us an account of one of these meetings, which it may not be out of place to transcribe:—'The first circumstance that struck me,' she observes, 'was the extreme order and business-like appearance of the whole

assembly. No listless loungers occupying a couple of chairs with their elaborate idleness; no boots, looking as though they had collected all the dust or mud of a great thoroughfare; no members sitting with their hats on, as if tacitly to express their contempt both for their occupation and their colleagues, were to be seen even in the informal and undress meeting of the Hungarian deputies. The tables were covered with papers, folio volumes containing the national laws, and the caps and gloves of the members. . . . The crowd who thronged the lower end of the hall, and extended for some distance between the tables, were orderly and attentive; and the regularity with which the proceedings progressed was admirable; and, after all that I had been told on the subject of the "semi-barbarous legislators" of the country, surprised me not a little.'

Another peculiarity is worth notice:—'In one respect the Hungarian people have the advantage of our own as regards their representation—no deputy being permitted to vote against the feeling of his constituency.' Remarkable instances sometimes occur of the exercise of this privilege. On one occasion a debate arose as to the late King Ferdinand's right to levy troops, while at the same time interfering with the freedom of public discussion. Among others, a deputy from one of the most populous counties spoke strongly in favour of voting the levy, much to the satisfaction of the government party; but on concluding, he said—'These are my opinions, my principles, and my views. I cannot look upon the question in any other light. But—I am instructed by the county which I represent to vote with the opposition; and my vote must be registered accordingly.' As may be expected, the Opposition were not slack with their cheers. The elections, in which the system of voting by ballot prevails, are conducted pretty much as in England—that is, with music and shouting, speechifying and excitement.

In 1823-24, the government, forgetful of constitutional stipulations, attempted to levy troops without the concurrence of the Diet. This produced a new Magyar movement in 1825, headed by two of the most distinguished nobles, Szechenyi and Wesselenyi. To the former is mainly owing the navigation of the Danube, which, prior to his exertions, was in a very imperfect state. He is the author of several treatises on political and economical questions; in which, for the first time, his countrymen have been able to read wholesome truths, and to find their faults unsparingly rebuked. The Magyars have had the good sense to appreciate the writer's object; and his frankness, instead of repelling, has won their esteem. Szechenyi has mainly sought to indoctrinate the higher nobility, while Wesselenyi has laboured to extend the influence of the lower ranks; and, with a view to acquire greater popular rights, has purchased land in numerous counties. Thus, on the one hand, Magyarism has been catechising and criticising administrators and political economists; and on the other, energising the provinces, stirring multitudes to the necessity of action, and inspiring a band of ardent writers. Among the latter, the poet Worosmarty has roused and thrilled the national heart by his songs and poems, overflowing with generous sentiments and exalted patriotism.

It is not to be expected that the course of politics, any more than that of love, should run smooth; and causes of difference have arisen in Hungary from the impatience of the Magyars to realise their views without delay: the Croats and Slovaks contend for equal privilege on their part, at times with a warmth that threatens violence. Austria has always been ready to foment these jealousies, as a means of affirming her own power; but late events have tended to abate them, by showing the necessity for combined effort unbiassed by prejudice. The two great champions are not now heard as formerly: Szechenyi slackened his exertions on finding the course of events leading to extremes; and Wesselenyi, for a speech in which he denounced Austrian injustice, was punished by a long imprisonment, which

so weakened him, that on his release he was unable, as before, to take an active part in public life.

But if the *hour* be come, the *man* is there: Ludvig Kossuth* has proved himself no unworthy leader. He began life as an attorney, and first came into collision with the government by publishing reports of the proceedings of the Diet in defiance of the law. Mr Köhl thus speaks of the 'noble deputy.' 'He was imprisoned for a considerable time for having made public some discussions of the Diet, which were forbidden to be printed, by distributing a considerable number of manuscript copies. He was subsequently liberated, and is now editor of the "Pesti Hirlap" ("Pesth Journal"), the most popular Hungarian paper, and the most fearless and untiring advocate of all that tends to the amelioration and advancement of his country; the boldest and most unsparing denouncer of the errors and abuses in the constitution and government. He has made it his especial care to keep guard over what he considers the weak side of his countrymen—namely, the liability of the judges and other officers to corruption and irregular influences, and never fails to discover and expose offences of this description. Under these circumstances, it cannot be but that Mr Kossuth should have many enemies; but he counts a far greater number of friends—the whole public of Hungary being on his side—and he is the favourite and political hero of the day. His "Hirlap" is the oracle on all occasions; and during my stay in Pesth, whenever any public matter was discussed, I continually heard the eager inquiry—"What does Kossuth say of it?"

'I looked with much interest at this man, on whom the eyes of all Hungary may be said to be fixed. He is of middle size, and very agreeable exterior; his features are regular, and decidedly handsome, but strongly-marked and manly. He is in the prime of life, with rather redundant hair and whiskers, but a mild and modest expression of countenance. He was rather pale when I saw him, and his features wore an air of earnestness, slightly tinged by melancholy, though lighted up by his fine flashing eyes. He spoke for full half an hour without a moment's hesitation, and his mode of delivery appeared to me extremely agreeable. His voice is as fine as might be expected from so handsome a person; and the sounds of the Hungarian language, powerful and energetic, seemed, from his lips, I might almost say warlike, although they come hard and harsh from the mouth of an uncultivated speaker.'

The above description was written six years ago, since which time Kossuth—the Magyar Cobden—has risen higher in popularity and usefulness. He is now 'Governor-Protector' of Hungary; and should his life be spared, there is every reason to hope that the exercise of his noble talents will prove a lasting benefit to his country. The difficulties of the position are great, but not greater than may be overcome; and the elements of success are not lacking. Hungary possesses a soil of unrivalled fertility, producing an almost tropical vegetation, teeming with grain and fruit. The Banat alone will grow ten times as much corn as is needed for her whole population; and beneath the surface the mineral treasures are inexhaustible. There are mining and other schools, and libraries and learned societies in her towns; her press sends forth numerous works annually, and the spirit of improvement animates the people. Much may be done by the application and development of such resources as these. Instead of being pitted against neighbouring states, their entire strength may now be devoted to the social wants of their own country, and the amelioration of its condition. The bulk of the population is Protestant: they embraced the doctrines of Calvin at an early period; and their manful struggles against persecution, and their valiant efforts in behalf of the Empress Maria Louisa, are noble chapters of history.

During their present struggle for constitutional rights,

the savagery of surrounding races has been let loose upon them with a vindictiveness which we could only expect from a Tamerlane or Nadir Shah; but which, to present notions, savours more of a desire to exterminate than to conciliate. Ever since 1835, the party which sought to modify the relation between noble and peasant has been gathering strength. By and by came the outbreak in Galicia, which alarmed the one and excited the other. The Diet of 1847 drew up a series of resolutions embodying certain reforms: no class was to be exempt from taxation, but all were to pay in proportion to their means; civil equality was declared; the peasant relieved from his *corvées*; the old exactions were altogether abolished; and a large extension of the suffrage granted. But to accomplish all this, it was necessary that Austria should no longer have uncontrolled power over the public purse of Hungary, and that her demoralising efforts to bend every community to her deadening policy should cease.

The Diet proved itself in earnest, for every religion was tolerated, and the peasants were not only released from feudal servitude, but the nobles gave up to them more than two-thirds of the cultivated lands throughout the kingdom. Twenty millions of acres have been divided into thirty or sixty-acre lots, and apportioned among five hundred thousand peasants, now invested with all the rights of ownership. Every person is entitled to vote who pays a yearly rent of L.10, or whose property amounts to an annual value of L.30: a mechanic who keeps an apprentice, and individuals holding university diplomas, may also vote. Croatia was pacified, the Diets of Hungary and Transylvania united, and the whole of the proceedings signed and confirmed, by the emperor at Vienna in April 1848; but while the rejoicings were still going on throughout the newly-regenerated kingdom, the central government commenced its schemes for deliberately nullifying what, through its sanction, had become the law of the land. A revolt was excited in Croatia, and a Croat colonel, Baron Joseph Jellachich, appointed Ban, or ruler; and at the same time the frontier tribes were everywhere instigated to attack the Hungarians. At last Austria threw off the mask, and sided openly with the Croats, and then the Magyars became aware of the duplicity of which they had been the victims. Still they did not wish to renounce their fealty; and the documents authorising levies of troops, and an issue of paper money, were sent, as usual, to be countersigned by the emperor. For a time circumstances appeared to favour the Austrian cause; the rebel kingdom was overrun with marvellous rapidity, and encountering but few enemies. But the roads were broken up and barricaded, ditches dug, and filled with water, bridges broken down, streams of water made to flood the lowlands, everything in the shape of food was destroyed; so that by the time the conqueror reached Pesth, he had lost ingloriously thousands of men. It was now the Magyars' turn; under the brave generals Georgey, Bem, and Dembinski, they came up from the interior of their land, and before many weeks were over, a series of splendid victories had crippled the invaders, and driven them clean out of the country. A provisional government was formed, which hitherto has successfully provided against all contingencies. Russian troops are now called in to assist in extinguishing this newly-kindled spark of freedom: should the Magyars succeed in beating them also, Eastern Europe will have scope to march on its noble career of civilisation.

Hungary and Transylvania united present an area a little larger than that of Great Britain and Ireland, being 125,000 square miles. The population is 14,000,000, of which 5,000,000 are Magyars, the remainder being Slaves, Wallacks, Jews, and Germans. Now that they are freed from the oppressive burthen of Austrian duties, their internal and foreign trade may be largely extended. The vast body of new enfranchised proprietors will pour supplies into the market, and may obtain manufactured articles in exchange by other

* Pronounced Kossoot.

means than the periodical fairs on the Bavarian frontier. There is a great demand for articles and munitions of war, which are admitted duty free; cotton goods pay a small charge. A correspondent of the 'Mining Journal' recommends English merchants, as soon as they hear of the capture of the port of Fiume by the Magyars, to lose no time in forwarding cargoes of saddlery and hardware, which would meet immediate sale. In return, we may get hemp, flax, tallow, wool, grain, hides, and splendid tobacco.

It has been the misfortune of the Hungarians to be overpraised or calumniated; we think the time has come when their true character will be better understood. With many defects, they possess qualities and social customs well worthy of imitation. While writing this sketch, a thought has been present to our minds, with which we conclude. It is this: how much misery and mischief would be avoided if rulers would take the trouble to learn the A B C of polity and morality!

POPULAR RHYMES AND NURSERY TALES OF ENGLAND.*

MR HALLIWELL has been encouraged, by the success of his collection of nursery rhymes, to form a more comprehensive collection aspiring to contain the popular rhymes of England, on the model of the Scottish collection of Mr R. Chambers. While regretting that, from defective opportunity or want of time on the part of the editor, it is a less extensive or perfect assemblage than might be wished, we receive it with pleasure, as at least tending to supply a desideratum which we had long had in view, and as being, in itself, and as far as it goes, a most agreeable contribution to our literature. Mr Halliwell gives, like Mr Chambers, a collection of rhymes, generally of a proverbial character, on places and families; also rhymes on natural objects and on popular superstitions. He puts on record the snatches of quaint verse employed in the nursery for the solacement of infants, and amongst children themselves in their amusements; likewise the prose recitals which pass current by cottage firesides through all ages, and all over the land. He gives a serious interest to many of these things by tracing their great antiquity and their connection with similar examples of what Mr Chambers originally, we believe, called *natural literature*, in other countries.

It is curious to learn that variations of the familiar song on the ladybird belongs to the vernacular literature of England, Germany, Denmark, and Sweden; and that the riddle, *Humpty Dumpty sat on a wall*, is, in one form or another, a favourite throughout Europe. The following is the Danish version of that ingenious enigma:—

'Lille Trille
Laas paa Hylde;
Lille Trille
Faldt ned af Hylde.
Ingen Mand
I hele Land
Lille Trille curere kan.'

Which may be thus translated:—

'Little Trille
Lay on a shelf;
Little Trille
Thence pitched himself:
Not all the men
In our land, I ken,
Can put Little Trille right again.'

Equally curious it is to learn that an old woman intrusted with an infant in Jutland will amuse it, exactly

as her remote English cousin will do, by touching its features in succession, with a facetious play upon the name of each; thus:—

'Pandebeen,
Oisteen,
Nasbeen,
Mundelip,
Hagetip,
Dikke, dikke, dik!'

That is—

'Brow-bone,
Eye-stone,
Nose-bone,
Mouth-lip,
Chin-tip,
Dikke, dikke, dik!'

a ticklement under the chin following the last line. Or to find that, while the English mamma apostrophises the fingers of her babe, as—

'Tom Thumbkin,
Bess Bumpkin,
Bill Wilkin,
Long Linkin,
And Little Dick,'

the Danish dame is equally prone to the following mysterious allusions:—

'Tommeltot,
Slikkepot,
Langemand,
Guldbrand,
Lille Peer Spilleman;'

running over the several digits in succession as she speaks. The last line means 'Little Peter the Fiddler,' which Mr Halliwell justly remarks is not a bad name for the little finger. The community of such things to northern Europe and a country which stands towards it in nearly the same colonial character as Massachusetts to Great Britain, seems a sufficient proof of their great antiquity.

It is not merely in such simple matters that such a community of ideas is to be traced; we find it likewise in productions of the intellect where a more special as well as elegant character is observable. There is, for instance, a game reported from Essex by Mr Halliwell. 'Children form a ring, one girl kneeling in the centre, and sorrowfully hiding her face with her hands; one in the ring then says—

Here we all stand round the ring,
And now we shut poor Mary in;
Rise up, rise up, poor Mary Brown,
And see your poor mother go through the town.

To this she answers—

I will not stand up upon my feet,
To see my poor mother go through the street.

The children then cry—

Rise up, rise up, poor Mary Brown,
And see your poor father go through the town.

Mary.

I will not stand up upon my feet,
To see my poor father go through the street.

Children.

Rise up, rise up, poor Mary Brown,
To see your poor brother go through the town.

Mary.

I will not stand up upon my feet,
To see my poor brother go through the street.

Children.

Rise up, rise up, poor Mary Brown,
To see your poor sister go through the town.

Mary.

I will not stand up upon my feet,
To see my poor sister go through the street.

* By James Orchard Halliwell, Esq. London: J. R. Smith. 1849.

Children.

Rise up, rise up, poor Mary Brown,
To see the poor beggars go through the town.

Mary.

I will not stand up upon my feet,
To see the poor beggars go through the street.

After a protracted dialogue, in which gentlemen and ladies are successively introduced without having any effect on Miss Brown, the following occurs :—

Rise up, rise up, poor Mary Brown,
And see your poor sweetheart go through the town.

The chord is at last touched; and Mary, frantically replying—

I will get up upon my feet,
To see my sweetheart go through the street,

rushes with impetuosity to break the ring, and generally succeeds in escaping the bonds that detain her from her imaginary love.* Now it appears there is a similar ring-dance song in Sweden. 'A girl sits on a stool or chair within a ring of dancers, and, with something in her hands, imitates the action of rowing. She should have a veil on her head, and at the news of her sweetheart's death, let it fall over her face, and sink down, overwhelmed with sorrow. The ring of girls dance round her, singing and pausing, and she sings in reply. The dialogue is conducted in the following manner :—

The Ring.

Why row ye so, why row ye so?
Fair Gundela!

Gundela.

Sure I may row, ay sure may I row,
While groweth the grass,
All summer through.

The Ring.

But now I've speired that your father's dead,
Fair Gundela!

Gundela.

What matters my father? My mother lives still.
Ah, thank heaven for that!

The Ring.

But now I've speired that your mother's dead,
Fair Gundela!

Gundela.

What matters my mother? My brother lives still.
Ah, thank heaven for that!

The Ring.

But now I've speired that your brother's dead,
Fair Gundela!

Gundela.

What matters my brother? My sister lives still.
Ah, thank heaven for that!

The Ring.

But now I've speired that your sister's dead,
Fair Gundela!

Gundela.

What matters my sister? My sweetheart lives still.
Ah, thank heaven for that!

The Ring.

But now I've speired that your sweetheart's dead,
Fair Gundela!

[Here she sinks down, overwhelmed with grief.]

Gundela.

Say, can it be true
Which ye tell now to me,
That my sweetheart's no more?
Ah, God pity me!

The Ring.

But now I've speired that your father lives still,
Fair Gundela!

Gundela.

What matters my father? My sweetheart's no more!
Ah, God pity me!

The Ring.

But now I've speired that your mother lives still,
Fair Gundela!

Gundela.

What matters my mother? My sweetheart's no more!
Ah, God pity me!

The Ring.

But now I've speired that your brother lives still,
Fair Gundela!

Gundela.

What matters my brother? My sweetheart's no more!
Ah, God pity me!

The Ring.

But now I've speired that your sister lives still,
Fair Gundela!

Gundela.

What matters my sister? My sweetheart's no more!
Ah, God pity me!

The Ring.

But now I've speired that your sweetheart lives still,
Fair Gundela!

Gundela.

Say, can it be true
Which ye tell now to me,
That my sweetheart lives still?
Thank God, thank God for that!

The veil is thrown on one side, her face beams with joy, the circle is broken, and the juvenile drama concludes with merriment and noise. It is difficult to say whether this is the real prototype of the English game, or whether they are both indebted to a still more primitive original. There is, pursues Mr Halliwell, 'a poetical sweetness and absolute dramatic fervour in the Swedish ballad, we vainly try to discover in the English version. In the latter all is vulgar, commonplace, and phlegmatic. Cannot we trace in both the national character? Do we not see in the last that poetic simplicity which has made the works of Andersen so popular and irresistibly charming? It may be that the style pleases by contrast, and that we appreciate its genuine chasteness the more because we have nothing similar to it in our own vernacular literature.'

Of the antiquity of the popular rhymes of England Mr Halliwell adduces some special illustrations of a remarkable character, though not always, we think, with the effect of convincing a cautious reader. We overlook for the present the more problematical cases, and would merely remark that it is interesting even to learn that 'A was an apple-pie, B bit it, C cut it,' &c. is used as an illustration in a work on preaching, published by Eachard in 1671; or that 'Nanty Panty, Jack-a-Dandy, loved a piece of sugar-candy,' &c. besides many of the like rhymes, is referred to in a satirical poem written about 1720, it is supposed, on a popular bard of that day: thus—

' Namby Pamby's double mild,
Once a man, and twice a child;
To his hanging sleeves restored,
Now he fools it like a lord;
Now he pumps his little wits
All by little tiny bits.
Now, methinks, I hear him say,
Boys and girls come out to play,
Moon does shine as bright as day:
Now my Namby Pamby's* found
Sitting on the Friar's ground,
Picking silver, picking gold—
Namby Pamby's never old:
Bally-cally they begin,
Namby Pamby still keeps in.
Namby Pamby is no clown—
London Bridge is broken down;
Now he courts the gay ladee,
Dancing o'er the Lady Lee:
Now he sings of Licksplit Liar,
Burning in the brimstone fire;

* 'Namby Pamby is said to have been a nickname for Ambrose Phillips. Another ballad, written about the same time as the above, alludes to the rhyme of "Goosy Goosy, Gander."'

Lyar, lyar, Licksapit, lick,
Turn about the candlestick,
Now he sings of Jacky Horner,
Sitting in the chimney corner,
Eating of a Christmas pie,
Putting in his thumb—oh fie!
Putting in—oh fie! his thumb,
Pulling out—oh strange! a plum!
Now he acts the grenadier,
Calling for a pot of beer:
Where's his money? He's forgot—
Get him gone, a drunken sot!
Now on cock-horse does he ride,
And anon on timber stride,
See and saw, and sack'ry down,
London is a gallant town!

The probability we believe to be, that nearly all the popular rhymes of both countries have come down from an early age, albeit in many cases with slight alterations.

The fireside stories, though including Jack and the Giants, and some other old favourites, are disappointing. They are not told in the nursery manner, and have in general a more prosaic character than we should expect. In rhymes and tales alike, if we could depend on our own impartiality, we should be inclined on the whole to say that Scotland shines out as a more poetical and sentimental country than England. But this is not a point for us to press, and we are too much pleased with Mr Halliwell's labours to criticise rigidly in the matter. As a conclusion to the short notice to which we are limited, we cannot do better than quote what our editor gives regarding the robin and the wren. 'The superstitious reverence with which these birds are almost universally regarded takes its origin from a pretty belief that they undertake the delicate office of covering the dead bodies of any of the human race with moss or leaves, if by any means left exposed to the heavens. This opinion is alluded to by Shakspeare and many writers of his time, as by Drayton, for example—

Covering with moss the dead's unclōsed eye,
The little redbreast teacheth charitie.

'Webster, in his tragedy of "Vittoria Corombona," 1612, couples the wren with the robin as coadjutors in this friendly office:—

Call for the robin redbreast and the wren,
Since o'er shady groves they hover,
And with leaves and flowers do cover
The friendless bodies of unburied men.

'Notwithstanding the beautiful passage in Shakspeare to which we have alluded, it is nevertheless undeniable that, even to this day, the ancient belief attached to these birds is perpetuated chiefly by the simple ballad of the Babes in the Wood. Early in the last century, Addison was infatuated with that primitive song. "Admitting," he says, "there is even a despicable simplicity in the verse, yet because the sentiments appear genuine and unaffected, they are able to move the mind of the most polite reader with inward meltings of humanity and compassion." Exactly so; but this result arises from the extraordinary influence of early association over the mind, not from the pathos of the ballad itself, which is infinitely inferior to the following beautiful little nursery song I have the pleasure of transcribing into these pages:—

My dear, do you know
How a long time ago,
Two poor little children,
Whose names I don't know,
Were stolen away
On a fine summer's day,
And left in a wood,
As I've heard people say.
And when it was night,
So sad was their plight,
The sun it went down,
And the moon gave no light!
They sobbed and they sighed,
And they bitterly cried,
And the poor little things
They laid down and died.

And when they were dead,
The robins so red
Brought strawberrie leaves,
And over them spread;
And all the day long,
They sang them this song—
Poor babes in the wood!
Poor babes in the wood!
And don't you remember
The babes in the wood?'

VISIT TO IMPROVED DWELLINGS FOR WORKING-CLASSES.

WHEN lately in London, I had an opportunity of visiting the large building which, a few years ago, was erected at Somer's Town, St Pancras—a northern extension of the metropolis—as Model Dwelling-Houses for the Working-Classes. Approaching it from the south, after crossing the New Road, we have occasion to pass through a series of small, narrow streets, environed by houses and lanes of the meanest possible kind, and at the time of my visit, well strewn with vegetable and other refuse from the shops and stalls of greengrocers and costermongers. On getting pretty well clear of this unsightly district, I arrived at the model dwelling-house, which may be said to terminate at the corner of a main line of street. It is a large brick building composed of a centre and two advancing wings, with a courtyard in front; the whole enclosed with an iron railing. My first impression on seeing the edifice was disappointing: it had too much the air of a workhouse, a factory, or at least a public institution of some sort—perhaps an 'hospital supported by voluntary contributions.' I would humbly object to the fancy of getting up any species of dwellings for working-people, which will have the least effect in keeping these classes distinct from the ordinary population—in making them feel that they are a *caste* 'to be done for' by kindly-disposed people. I am afraid that the edifice in question is too much calculated to convey such impressions, and so far I think there has been an error in the structural arrangements. Unless there be some special reason to the contrary, I should prefer seeing houses of this nature forming part of the general line of street, or at all events not hospital-like in external appearance.

The building has no sunk storey: it rises from the level ground to a height of five storeys, each showing a long range of windows. The entrance to the courtyard in front is by two gateways in the railings; from the courtyard, the different floors are reached by common stairs. There are no outer doors on the stairs, which is a disadvantage, for by this means the cold wind has free access to the top of the building; and the doors to the respective dwellings on the landing-places being thin, the houses in winter are far from being so warm and comfortable as they might otherwise be. On making an observation as to the want of outer doors at the foot of the stairs, I was told that that was admitted to be a defect; but that, on the other hand, if doors were attached, openable at pleasure by all comers, the stairs would be the nightly resort of *tramps*—the *lazzaroni* of the streets, who gladly shelter themselves anywhere. The application of a process for opening and shutting the outer-doors from each landing, on a bell being rung without, as in Edinburgh, would unfortunately entail far too heavy an outlay; and besides, the vast number of children who require to go freely out and in, renders any process of outer-door shutting inadmissible.

With these preliminary remarks, we ascend to one of the dwellings. The first thing noticed is the narrowness of the passage and stair; and the second, that the walls, from bottom to top, are unplastered—the bricks being only whitewashed over. I would not say that the want of plaster is objectionable; it only raises an unpleasant idea of ultra-economy as to the construction. I, however, found every stair remarkably clean, considering the amount of thoroughfare; which is more than can be said of many common

stairs in Scotland. Each stair is lighted by a skylight. On every landing there are three, sometimes four doors, of as many distinct dwellings. When we enter one of these house-doors, we find ourselves at once in an apartment seemingly half-kitchen, half-room. I did not observe that any houses had inner porches, though in some a short passage leads to the first apartment. The apartments in a dwelling always lead from each other: you go through the kitchen to the bedrooms. From a plan furnished by the resident collector of rents, I observe that in one class of houses the sitting-room, which is used also as kitchen, measures 14 feet by 10 feet 6 inches, the bedroom 12 feet 11 inches by 6 feet 10 inches, and the bed-closet 12 feet 11 inches by 9 feet 7 inches. The kitchen is provided with a range, which contains a small boiler and oven. Entering from the kitchen or sitting-room, there is a small light closet, provided with every suitable accommodation—water, sink, &c.; in one corner is a shaft, down which dust may be poured. The various shafts communicate with dust-holes beneath the ground-floor, which are cleared out at short intervals. The entering of the closet from the sitting-room, which is not unusual, must appear to every one as an objectionable arrangement: the superiority of an entrance from a porch between an outer and inner door on the landing is obvious. Another structural defect is the want of accommodation for coal. In one of the houses I examined there was only the bottom of a cupboard, which would hold perhaps one or two hundredweights of this much-used article. As the working-classes are held down not less by their general improvidence than a habit of buying all articles in small parcels, it should be an important object to encourage them, by all suitable appliances, to purchase everything, coal particularly, in a reasonably large quantity: all Scottish dwellings on floors, except the very meanest, have accommodation for at least a ton of coal. In looking round the interior of these houses at St Pancras, I was again struck with the plain style of finish. There is not a bit of cornice, and the make of the windows and doors is far from creditable—contract work, it may be presumed, jobbed, relatively dear, and unsatisfactory. It is right to add that every house I entered possessed the usually tidy and comfortable look of English dwellings, however humble. Many windows had neat curtains; some rooms were prettily papered, and had prints in frames: all were less or more carpeted. But who can do anything but praise the love of order and decency which signalises the English, wherever found in an undegraded state? At one stair-head an inhabitant had nailed in a little space on the landing for flowers in pots, a circumstance suggestive of pleasing reflections. What dwelling may not be adorned and rendered more loveable by a few flowering-plants?

The number of distinct houses in the building is 110, or at the rate of 13 to 15 houses in each of the eight stairs. The rents vary according to size. Houses of two rooms are from 3s. 6d. to 5s. per week; and of three rooms, from 4s. 9d. to 6s. 3d. per week. These charges include water and all taxes and rates. The rents are no doubt low in comparison with those payable for floors or portions of floors by many families of a humble class in the densely-crowded parts of London; but I am disposed to consider them high in relation to what ought to have been, by prudent management, the outlay on their construction in such a situation. The sum of 6s. 3d. per week, or L.16, 5s. per annum, seems no light charge for a house of three small apartments up a stair, when compared with the rents at which independent dwellings of five or six rooms can be obtained within three miles of the Exchange. And yet, all things considered, they are a decided improvement on the houses of a small size usually rented in crowded neighbourhoods.

The building, it may be known, is the property of the 'Metropolitan Association for Improving the Dwellings of the Industrious Classes,' incorporated in 1845.

The capital of the Association was raised by shares, on what we consider the only sound principle in such undertakings—the profitable investment of money. As yet, the return has not come up to the expectation of realising 5 per cent. interest. The speculation, however, is not a failure. The object of providing houses of a decent and wholesome kind to the industrious classes has been satisfactorily realised. Having seen it somewhere mentioned that these classes had not taken advantage of the opportunity here presented to them, I was at some pains to inquire into this allegation, and have pleasure in stating that it is entirely groundless, as the following list of inhabitants will demonstrate:—13 printers and compositors, 7 piano-forte-makers, 7 clerks, 5 working-jewellers, 3 engravers, 2 porters, 2 railway police, 5 chasers, workers, and polishers of silver, 3 artists, 1 usher, 3 engine-makers, 4 tailors, 2 missionaries, 3 coach-makers, 3 painters, 3 journeymen stationers, 2 pattern-designers, 1, each, whip-maker, cutler, grainer, cabman, cabinet-maker, copperplate-printer, blind-maker, typefounder, &c. Whatever, therefore, may be said with regard to the better construction and arrangement of buildings of this nature, it is an undoubted fact that the working-classes, as they are called, do in sufficient numbers take advantage of them.

From a report read at a late annual meeting of the Associated Proprietary, we transcribe the following passages:—'All the dwellings have been occupied, and almost without intermission, from the date of their completion; and several applicants have been, and are still, waiting for vacancies. Fifty-nine families have continued tenants since their respective dwellings were ready for occupation in January, February, March, and April 1848. The total number of tenants has been 173, several of whom, having left their apartments, have subsequently wished to return. It is gratifying to the directors to make this statement; and they have pleasure in being able to add, that not only have the tenants expressed themselves pleased with the superior comforts and accommodation afforded them, but have also proved, by regularly paying their rents, and their general strict observance of such rules as your directors have thought proper to lay down for the management of so large a building, that they are desirous of assisting them in preserving a high character for respectability in its occupants. The strongest fact, however, which the directors can advance to prove the healthy condition of this first investment of the Association, is, that out of L.1390, 1s. 3d. of rents accrued due, L.1382, 12s. 4d. have been paid, leaving only L.7, 8s. 11d. in arrear; the whole of which, within a few shillings, will be ultimately received, the prospects of the artisan being better at the present time than at the period of the actual receipts. It may be remarked that, of 173 tenants who have occupied the buildings, on two only has it been found necessary to distrain, both of whom have since paid their arrears. Nine deaths only have taken place in the building, eight of which were children. There are now 351 children on the premises, and 29 have been born there.'

On the same occasion the Earl of Carlisle observed, that 'even in a commercial point of view, the success of the Association could no longer be doubted; but were they to look at the case in a moral point of view, all doubts and misgivings as to success must vanish from their minds, and their language and feelings must be those of congratulation and assurance. To enable them fully to participate in these feelings and sentiments, he would only advise them—such as had not done so—to pay a visit to the dwellings. It was that which would, more than anything else, excite them to vigorous action in behalf of the objects of the Association. When they saw the neatness and the cleanliness of the apartments in those dwellings, and thought of the miserable hovels in which the majority of the industrious classes had been hitherto crammed, and from which those who inhabited those apartments had been transferred—in

damp cellars, surrounded with foul air and filth of all kinds, or mounted up in attics under the broiling tiles, exposed to the summer sun—when they thought of that, and contrasted the pleasant apartments they were now placed in, certainly no one could but feel that a more rational mode of exercising their benevolence could not be devised. It was true there was nothing gaudy about those dwellings; but they were well aired, and were capable of affording many comforts which their ancestors, who lived under lofty ceilings, and in gilded apartments, could not boast of. They were capable of affording most of the comforts, and many of the luxuries of social life. The proportion of deaths which had taken place among those who inhabited them were few in comparison to the rest of the metropolis; while the society of the metropolis had been enriched by a number of births which had taken place in them. It was said at the outset that these dwellings would be inhabited by a set of ill-behaved, troublesome individuals; but he spoke the truth when he said that the fact was the reverse: a better-conducted class of people could not be found.*

Dr Southwood Smith spoke to the same effect; and referring to the comparatively small number of deaths, observed:—‘Taking the deaths at twelve—five adults and seven children—the mortality was only 1·4-10 per cent., while the mortality in the metropolis generally was 2·3-10 per cent., or double that among the residents of those dwellings. There did not seem to have been a single case of typhus fever, nor fever of any kind among the adults; neither had there been any case of cholera. But the best test as to the healthiness of a place was afforded by the deaths of children. In different parts of the metropolis the amount of the mortality among children varied. In Holborn, St Giles’s, St Saviour’s, and Whitechapel, the mortality among children under five years of age was so high as 10 per cent. In other parts of the metropolis it was 8 per cent., but in this establishment only 1·4-10 per cent. Those facts spoke for themselves, and must convince every one of the good the Association had effected.’

The Association is at present engaged in erecting a similar establishment at Spitalfields: it is to be called the Artisans’ House, and to possess a lecture and school-room, coffee-room, cook’s-shop, and other accommodations for general use. We regret to see that some of the defects of the St Pancras building are to be reproduced in this.

ODDITIES OF CENTRAL AMERICA.

THERE is a little volume before us which is a favourable specimen of what may be done, even in the way of writing a book, by a man ignorant of science or literature, but having reasonably observant eyes in his head, and common sense to direct them.* It affords at the same time, however, an illustration of the absurdity of the common educational curriculum, which begins and ends with certain languages. In the exceptional cases in which the boy is born an artist, this introduces him to a literary career, but to nothing else. His mind has not been farther opened. It has not been sought to make him acquainted with the globe he inherits, with the system of which it is a part, with its materials and their combinations, with its inhabitants, animal and vegetable; and the consequence is, that when he goes abroad into the world, he sees without understanding, and is satisfied with receiving and reproducing a series of mere sensuous images, fit only for the amusement of minds as vacant as his own. It is truly lamentable to think how many ardent, chivalrous, and talented adventurers penetrate every day into the most interesting countries in the world, and return without having added anything to the stock of human knowledge beyond a

few facts, unconsciously given, but seized upon by those at home who comprehend their value. If travellers carried with them a knowledge, however general, of geology, mineralogy, botany, zoology, &c.—far more easily acquired than Latin and Greek—they would take altogether a new status as a body, and their books would be ransacked with eagerness by the learned, without giving a whit less delight to the vulgar.

Mr Byam, with perhaps somewhat less than the average literary skill in setting them forth, has more facts than are usually found in the compass of so small a volume; and without any scientific knowledge of natural history, his tastes as a sportsman have led him to bestow special attention upon the habits of animals. Some of the anecdotes he gives are new, and a greater number odd; but Oddity appears to be the characteristic of the whole country which is the scene of his ‘wild life.’

Central America, our readers know, is the isthmus connecting North and South America; and our traveller—whose objects were to hunt wild animals and discover rich mines—built his hut on the borders of Nicaragua and Segovia, about 120 miles from Leon, the capital of the former state. Food is plentiful, though coarse, throughout the country; but even in the towns the people are very poor, so far as regards the possession of money. If they have little wealth, however, they have few wants. All they care about is idleness and tranquillity. Mr Byam, in passing through a town (not on a holiday), counted the number of persons who were at work, and found them to amount to *four*! The oddity is, that these good quiet souls are never out of the turmoil of a revolution! The government is perpetually changing; proclamations flying about, neutralising each other; and the few hundred troops robbing and murdering all parties time about. In explanation, we are told that it is the few hundred troops who make the revolutions. ‘Leon, being the capital of the province of Nicaragua, and head-quarters for the troops, may contain fifty thousand inhabitants and about three hundred dissolute soldiers; and it is by this mere handful of ruffians, or rather by a portion of them, that revolutions are effected. A subaltern officer gains over a portion of the men with promises of plunder, increased pay, and promotion for the non-commissioned officers to the commissions soon to be vacant. They await the time when the barrack-guard and sentries will be all composed of the men so gained over. The barracks are then taken possession of in the night, the commandant’s house stormed and plundered, and the next morning a few volleys of musketry make the people acquainted with the fact, that their late commandant and his adherents have been placed on the fatal “Banqueta.”* and have made vacancies for the successful rebels, who may most likely be destined to suffer the *lex talionis* within a very few months.’

But it is only near the coast where these revolutions are felt: the interior is secure in its poverty, its paucity of population, and its independence of spirit. There the sturdy peasant sows his maize, and then has nothing to do but to hunt or fish. He has a horse for riding, and a cow or two for milk, curds, and cheese; and once or twice a year he takes a colt and a quantity of bees-wax to the nearest town, and buys with them a piece of chintz for his wife and daughters, and enough of strong linen for himself to make a pair of trousers and a shirt. What has such a man to do with revolutions, or revolutions with him?

The first oddity we come to among the animals is the ox, who has a great talent for deer-stalking, and takes much pleasure in its exercise. His education, however, is somewhat severe. He is tied up to a tree by the horns, and is every now and then beaten near their roots, till the horns are loosened, and become extremely sensitive. A cord is then fastened to each tip, and he is now guided as easily as a horse is when bitted. The horns in time get well, but not till he has acquired

* Wild Life in the Interior of Central America. By George Byam, Late Forty-second Light Infantry. London: Parker, West Strand. 1849.

* The seat upon which prisoners are placed when about to be shot.

the habit of being guided by them; and as soon as this is accomplished, he is taken out to stalk, and in a short time follows the amusement with all the keenness of a sportsman. 'It is really curious to watch the scientific mode in which an experienced ox conducts the operation on an open plain; he must take a pleasure in it, or else acts the part to perfection. No sooner does he perceive a deer on the open plain, than down goes his head, and he nibbles, or pretends to nibble, the grass, walking in a circular direction, as if he were going round and round the deer; but the cunning file always takes a step sideways for every one he takes in front, so as to be constantly approaching his victim, but in such a manner as to excite no alarm. In a large open plain the ox will make two entire circles, or more, round the game, before he has narrowed the inner one sufficiently to enable the hunter to take aim within proper distance; and the first notice the unsuspecting stag receives is an arrow, generally behind the shoulders—a gun-shot is best directed at the neck, but an arrow as above, for it impedes more the movement of the deer. An experienced hunting-ox is best left alone, as he is far more cunning than any hunter, and always keeps his master well hidden; he is only checked by a small pull when within shooting distance.'

Another way of hunting deer would seem to be very barbarous, but for the necessity the poor Indians are under of preventing depredations which, when successful, reduce their families to starvation. They observe the part of the fence which the deer leap over into their maize fields, and fix some sharp-pointed stakes in the earth for their reception. The marauders come bounding down after dark, and having no suspicion of a place they had passed in safety the night before, do not take the precaution to look before they leap. They are transfixed on the stakes, and an Indian watching at a distance runs up and destroys the victims.

The ox is not the only animal distinguished for his sporting propensities. The coyote, supposed to be a large breed of dog run wild, hunts the panther in packs, but only when the latter has by some aggression aroused his vengeance. When the panther, for instance, in the course of his travels, finds himself suddenly in the midst of an assembly of coyotes, he can rarely withstand the temptation to knock some of them over before taking to flight. The *esprit de corps* is immediately on fire at the insult, and the fugitive is followed by the dogs one and all. Tired out with the pertinacity of the pursuit, he at length takes to a tree, and perches himself on a branch high enough to be out of the reach of his enemies. But this does not dishearten them: the contest merely turns to a blockade, and assembling round the trunk, they wait patiently till their enemy descends, well knowing that he cannot remain there for ever. The conclusion of one of the odd hunts we give in the words of an Indian, Mr Byam's authority, only premising that by the word 'tigre' he means a panther:—"The tigre was free'd, Don Jorge, and the coyotes were about fifty in number, and they kept continually walking round and round the tree where the panther was sitting, uttering now and then a fierce growl. I saw this in the forenoon," said the Indian, "from a high tree which I had climbed up in search of honey; and towards sunset I mounted the same tree, and the tigre was still there, with the coyotes under the tree; but only about half the number, as the others had most likely gone in search of food; but at sunset they returned and took the others' places, who then took their departure. I went to my rancho, and at sunrise was again at my post, for I was very curious to see how it would all terminate: the tigre and the coyotes were still there, but the smell even where I was was horrible; and if I could smell it so strong, what must the tigre have done, who was only a few feet above it! At last he took a leap into the middle of the pack, and though he killed and disabled a few, he was soon pulled to pieces."

The coyotes hunt the deer likewise as regularly as

a pack of hounds. When they lose the scent, they separate in all directions; and when it is recovered, the successful individual announces the fact by a peculiar howl. These dogs never bark even when tamed, which, the Indians say, is a proof of their being of a dishonest breed: a dog of honour, according to them, barks in imitation of his master's shouts when driving cattle; but a coyote has no sense of fidelity, and will not take the trouble to learn.

The racoon is another odd fellow. He usually lives in communities of fifty and upwards; but occasionally, for some inexplicable reason, he separates from his comrades, and takes to the life of a hermit. This life agrees with him exceedingly well, and he grows sleek and oily. The beavers in North America who live out of their village have probably been expelled for their misdeeds, for they grow thin and shabby, and have a careworn, neglected look, like so many old bachelors. But the solitary racoon is probably influenced by some virtuous motive. He soon ceases to be lean and dry, as are all the comrades he has left; and instead of playing the ascetic, he gets all his little comforts about him, and eats, drinks, sleeps, and grows fat, like a racoon whose conscience is at rest. A hermit of this kind is rarely met with. Our author never saw more than one, and 'he was far heavier than his livelier brethren; also, when the skin was off, the fat was half an inch deep on his back, and half of him roasted the same day proved a most excellent feast for several persons: the weather would not allow of its being hung up for a few days, which no doubt would have improved it. The meat was like excellent roe venison with plenty of fat, which that sort of venison does not possess.'

There is a monkey in the forests surrounding the lake of Nicaragua which attaches himself to a particular locality, and even a particular tree. 'They generally appear to choose trees about a hundred yards apart, and there the great red-bearded monkey sits, making what seemed to me a booming noise, but very horrible, and without much variation. The cry is responded to by others, and taken up again by those more distant, and the forest resounds and echoes with the most unearthly sounds.' This monkey is himself an oddity, for the rest of the tribe wander about from place to place—'come like shadows, so depart'—and as they never travel but at night, have something mystical both in their appearance and disappearance. Here is an instance of the affection they show for their young:—'A person with me wishing to secure a young monkey alive, fired at the mother in whose arms it was, thinking she would fall, and the baby be unhurt;* however, the fall only broke her arm, when she shifted her child to the other arm, and tried to climb, but could not. She then placed the little one on her back, and with the assistance of another monkey, who was also wounded, raised herself from branch to branch of the surrounding trees, and, I was very glad to see, escaped.' To shoot wantonly such creatures!—"I have never but once," says our traveller, "fired at a monkey, and would never do it again, except at a troop of plunderers—and then a good example is not lost on their little community. Wantonly shooting them is cruel and useless; but let us always except from the list of the cruel those who are making collections of skins for stuffing; those who have fruit-grounds, and wish to keep them far away; and, above all, those who are hungry, and like a tender roasted monkey, which, setting prejudice aside, is as good a dish as it is possible to eat. But if a sportsman, for mere sport's sake, could see, as I have seen, a monkey with a rifle-ball through him, lying on his back on the ground, putting his hand upon the wound, and then raising the hand to the glazing eye to look at the blood, together with the anguish plainly shown by the almost human distortions of the face, he would never fire at one a

* 'The easiest way to procure a young monkey is to look out for a she monkey, with a young one in her arms; if she falls down, she is generally between the ground and the young one, who is seldom hurt.'

second time, or if he did, his heart must be of strange stuff and in a strange place.'

The monkey, however, is an odd animal everywhere; and we shall now direct our attention to another tribe of creation, selecting an instance to show that there are human feelings, habits, and manners among the birds as well as the beasts. Our author was one day watching at some distance the carcass of a pony, which had been placed on a hill with a view to its being devoured by the vultures. He saw with interest the gathering of these birds from all parts of the compass; and at length the dim specks in the sky, enlarging as they approached, resolved in one instance into a magnificent bird, with extended and seemingly motionless wings, the whirring noise of which became distinctly audible. This was the King of the Vultures; and the spectator, who had heard much of his majesty, was extremely anxious to observe what effect his presence would have upon those of his subjects who, coming from shorter distances, had already commenced the feast. They all retired; some perching on the neighbouring trees, but the greater number forming a circle around, and watching with courtier-like deference while the monarch alighted and commenced his meal. Long and heartily did the king eat; but not a single claw was extended towards the savoury food, either from the circle already formed, or by any one of the numerous guests who continued descending to the banquet. At length the Royal Vulture was satisfied; and having taken his departure, with a slower and heavier flight than before his arrival, his subjects threw themselves upon the fragments of the repast, and devoured them without ceremony.

Mr Byam, we may say in passing, combats the notion that vultures are attracted by the scent. 'Sight I believe to be the cause of the "gathering of the vultures;" for, having lived for six years in countries where vultures abound, and having examined their habits very closely, I have often seen this opinion confirmed. The enormous height they soar at gives them a widely-extended view, their keen eye enabling them to perceive a dead animal from incredible distances, and their instinct teaching them to watch the movements of dogs and other carnivorous animals, as well as to watch the flight of their own species.'

We come now to an odd adventure, which must have involved an agony of terror altogether without parallel. The coral snake is the most deadly in existence. After its bite there is no time even to attempt a cure; the victim falls instantly, his blood coagulates, and he soon becomes a lifeless mass of putridity. There is no mistaking the appearance of this terrible creature, which is made manifest not only by its bright-red colour, but by its body being of an almost uniform thickness from head to tail.

An Indian, dressed in a pair of loose drawers, with a coarse poncho over his head, lay down on his back on the side of an eminence near the path to sleep. He was awakened by something crawling over his leg. It was a coral; and gliding up his drawers, the reptile went to sleep upon his stomach. To move, almost to breathe, was death: but what to do? Even if travellers passed by, the first touch of their friendly hand would be the signal for the snake to sink its deadly fangs into his flesh. Yet this was his only chance of escape, slight as it might be; and after enduring unspeakable mental agonies, for what was to him an immeasurable time, he actually heard footsteps approach. He called out. The footsteps hastened—but hastened on—the passer-by taking the voice to be that of the decoy of some marauding Indians. Another came and passed, and another; till at length the poor wretch could only moan inarticulately as he heard the tramp of a horse. The rider saw him; and drawing near, observed distinctly the form of the snake (which was three feet long) beneath his drawers. He dismounted; and taking a pair of scissors from his saddle-bags, cut gently the cloth till the creature's head was visible as it lay fast asleep. He immediately seized it by the neck, and threw it suddenly off;

but it was some little time before the rescued Indian recovered sufficiently from his prostration both of mind and body to comprehend his safety, or even to be able to stand.

Another adventure is related of almost equal peril, but of a kind which, with somewhat less remorse, we can describe as 'odd.' Everybody remembers Mr Waterton's celebrated ride upon an alligator, and the severe remarks that were made upon the narrative by persons who had never seen an alligator in their lives. Mr Byam, however, who is intimately acquainted with the animal, who resided long near its haunts, and acquired a neighbourly knowledge of its habits and manners, declares that, even setting aside the *prima facie* evidence of Mr Waterton's high character, the account is perfectly probable and consistent. The tail of the alligator, he says, is the only dangerous weapon of the creature, which in the water he uses to stun any large animal he may encounter. When he accomplishes this, he drags his victim to the bottom, and holds it fast with his powerful teeth, while he tears it asunder with his claws. The tail is much less manageable on land, even if Mr Waterton's courser had been less occupied with the anchor in his mouth. The alligator, indeed, is dealt with very unceremoniously by the Indians of Central America; for when dragging the large pools of a river for fish, if one of these enormous creatures gets into the net, a man walks coolly into the water, throws a noose round the fore-leg, and he is straightway drawn on shore, and killed with the axes of the party.

Sometimes, however, these lords of the pool give more trouble, as the adventure we allude to will show. One of them was a perfect dragon among the calves, and even cattle that came to drink at the river, pulling them every now and then under the water; till the farmer, a dusky acquaintance of our author, became wild with rage. One day, when riding, he had the fortune to fall in with his enemy in shallow water at some distance from his accustomed pool; and having, as usual, his lasso with him, attached to the pommel of his saddle, he at once gave chase, and as the beast was making for his haunt, threw the noose round his neck, and tried to drag him to a tree on the bank. But he had entirely miscalculated his means: the horse was no match in strength for the alligator, and was brought upon his knees. The avenger, therefore, was compelled to follow where he thought to have led, and in an instant man and horse were spinning through the river to the opposite bank.

The predicament was serious, and our friend tried to sever the lasso with his axe. But the instrument was blunt; the hard thongs resisted its edge; and on dashed the alligator with his prisoners in his wake. Down thundered the three, through shallows and deep water, rattling over stones, plunging in pools, till a voice of terror came upon the farmer's ear—the roar of a fall of the river as high as a house! On hearing this, the first thought that darted through the man's mind was, that he was about to die unconfessed! 'No, caballero,' said he, when telling Mr Byam the story—'no, señor, there never was, nor ever will be again, such a *paseo* (promenade)!' He now remembered, however, all on a sudden that there must be a knife in the pocket of his sheep-skin mantle; and succeeding, after some trouble, in getting at it, he at length severed his tow-rope.

'For nights after, Don Jorge,' continued the relator of this adventure, 'I could not sleep; or if I did for a moment, awoke fancying myself going again on my *maldito* voyage down the river—sometimes soused to the bottom of a pool, and sometimes tumbling and rolling about among the big stones—until at last I took such a violent hatred to this particular alligator, that I used to lie awake all night thinking how to be revenged. I used to go to the pool every morning to try and get a sight of him, and one morning I did see him; but what made me still more angry was, to see the loop of the lasso still round his neck, for all the world like a necklace: he must have gnawed off the

remainder about a yard from the noose. I then went home, loaded my long Spanish gun very carefully with two balls, and taking with me a cur of a dog, who could do nothing but yell and howl, I returned to the pool, and tied the dog to a tree close to one of the alligator's paths. I then took a long string, and making it fast to the cur's leg, hid myself behind another tree, and began to pull hard at the string, and the dog began to howl lustily. In a short time the *lagarto's* nose appeared above water, and then his eyes and head: both dog and alligator must have seen each other pretty clearly, which made the dog howl more than ever. The beast, after looking round to see if the coast was clear, made straight for the shore, and was just creeping up the steep bank to seize the dog, when I fired my long barrel at him, not five paces distant, and sent a ball just into his eye. He was dead before you could say "Ave Maria!" and, Don Jorge, I slept soundly that night, and gave the cur-dog a good supper.'

This farmer stood much upon his dignity, which must have given a still higher relish to his story of having been run away with by an alligator. He was one day in a great rage with his son for having failed in an errand he had intrusted to him. He would fain have thought of some terrible name to call him, but ass, mule, or dog, would have been a reflection upon himself as the father of such an animal; and so, to save his dignity, while venting his indignation, he said to Mr Byam, 'Don Jorge, my son has eaten a he-mule for his breakfast!'

Let us conclude our list of oddities by mentioning that in Central America it is the custom for a man when overtaken by heavy rain, which there comes down in a deluge, not to cover himself up from the invasion, but to strip to the skin! This was our author's own practice when in the forest; and the reason was, that in that climate ague is invariably produced by wet clothes. The reader now sees, we hope, that there is some amusement to be gleaned from this little work; and he cannot do better than undertake the task for himself.

'HAPPY HOME.'

A young man meets a pretty face in the ball-room, falls in love with it, courts it, 'marries it,' goes to house-keeping with it, and boasts of having a home to go to and a wife. The chances are nine to ten he has neither. Her pretty face gets to be an old story—or becomes faded, or freckled, or fretted—and as that face was all he wanted, all he 'paid attention to,' all he sat up with, all he bargained for, all he swore to 'love, honour, and protect,' he gets sick of his trade; knows a dozen faces which he likes better; gives up staying at home of evenings, consoles himself with cigars, oysters, whisky-punch, and politics, and looks upon his 'home' as a very indifferent boarding-house. A family of children grow up about him; but neither he nor his 'face' knows anything about training them; so they come up helter-skelter—made toys of when babies, dolls when boys and girls, drudges when young men and women; and so passes year after year, and not one quiet, happy, homely hour is known throughout the whole household.—Another young man becomes enamoured of a 'fortune.' He waits upon it to parties, dances the Polka with it, exchanges *billets-doux* with it, pops the question to it, gets 'Yes' from it, is published to it, takes it to the parson's, weds it, calls it 'wife,' carries it home, sets up an establishment with it, introduces it to his friends, and says (poor fellow!) that he, too, is married, and has got a home. It's false. He is not married: he has no home. And he soon finds it out. He's in the wrong box; but it is too late to get out of it. He might as well hope to escape from his coffin. Friends congratulate him, and he has to grin and bear it. They praise the house, the furniture, the cradle, the new Bible, the newer baby; and then bid the 'fortune' and him who 'husbands' it good-morning! As if he had known a good morning since he and that gilded 'fortune' were falsely declared to be one.—Take another case. A young woman is smitten with a pair of whiskers. Curled hair never before had such charms. She sets her cap for them: they take. The

delighted whiskers make an offer, first one and then the other, proffering themselves both in exchange for her one heart. The dear miss is overcome with magnanimity, closes the bargain, carries home her prize, shows it pa and ma, calls herself engaged to it, thinks there never was such a pair (of whiskers) before, and in a few weeks they are married. Married! Yes, the world calls it so, and we will. What is the result? A short honeymoon, and then the unlucky discovery that they are as unlike as chalk and cheese, and not to be made one, though all the priests in Christendom pronounced them so.—*Burritt's Christian Citizen.*

CHILLIAN WALLAH.

BY GEORGE MEREDITH.

CHILLIANWALLAH, Chillianwallah!
Where our brothers fought and bled!
Oh thy name is natural music,
And a dirge above the dead!
Though we have not been defeated,
Though we can't be overcome,
Still, whene'er thou art repeated,
I would fain that grief were dumb.

Chillianwallah, Chillianwallah!
'Tis a name so sad and strange,
Like a breeze through midnight harpstrings
Ringing many a mournful change;
But the wildness and the sorrow
Have a meaning of their own—
Oh, whereof no glad to-morrow
Can relieve the dismal tone!

Chillianwallah, Chillianwallah!
'Tis a village dark and low,
By the bloody Jhelum River,
Bridged by the foreboding foe;
And across the wintry water
He is ready to retreat,
When the carnage and the slaughter
Shall have paid for his defeat.

Chillianwallah, Chillianwallah!
'Tis a wild and dreary plain,
Strewn with plots of thickest jungle,
Matted with the gory stain.
There the murder-mouthed artillery,
In the deadly ambuscade,
Wrok the thunder of its treachery
On the skeleton brigade.

Chillianwallah, Chillianwallah!
When the night set in with rain,
Came the savage plundering devils
To their work among the slain;
And the wounded and the dying
In cold blood did share the doom
Of their comrades round them lying,
Stiff in the dead skyless gloom.

Chillianwallah, Chillianwallah!
Thou wilt be a doleful chord,
And a mystic note of mourning
That will need no chiming word;
And that heart will leap with anguish
Who may understand thee best;
But the hopes of all will languish
Till thy memory is at rest.

A 'TRAP' QUESTION.

Looking in the other day at the Jubilee School of Newcastle, we found a score of the lads interrogating each other in history. One young rogue came out with a 'trap' question. 'How many kings,' said he, 'have been crowned in England since the Conquest?' Several answers were returned, but none receivable by the querist; and being called upon at length to furnish the information himself, he replied, 'One!' 'One!' exclaimed a dozen incredulous voices. 'Yes, one!' repeated young Quibble: 'James the Sixth of Scotland was the only king that was ever crowned in England!'—*Gateshead Observer.* [Richard the Lion-hearted was of course a king when he was crowned for the second time on his return to England after his imprisonment by the Duke of Austria.]

THE DESERT AND ITS ADVENTURES.

THE ancient and classical comparison of the Desert to the ocean, and the oases to verdant islands scattered on its surface, is as true to nature as it is beautiful in poetry; and it may assist in presenting to the imagination a more correct picture than is usually drawn of the great African wilderness. The Sahara, or Falat, as it is now more frequently called, has too long been a land of mystery, peopled only with paradoxes, and fertile only in natural impossibilities. It is represented as a uniform plain, entirely composed of arid sands, without water, without vegetation, offering, in short, no sustenance for either animal or vegetable life; then palm-trees are made to rise in this empire of absolute sterility, and wild beasts to rove in solitudes denuded of everything that could serve for nourishment or prey. Let us try if we cannot extract from the Algerian experiences of the French some ideas more consonant with nature and probability, and at the same time still more redolent of that spirit of romance which hovers over the waste places of the earth.

The fertile tract of country occupying the north of Africa, and stretching along the shores of the Mediterranean, is called the Tell, and may be considered the continent of the white people. It is a belt of about eighty miles broad from north to south, bounded on the north by the humid plains of the Mediterranean, and on the south by the burning waves of the Desert, which recent French writers call the Algerian Sahara. This desert, which includes the solitudes of Shott, Aughad, &c. divided by the great Atlas Mountains, and diversified with numerous oases, represents a sea studded with islands grouped in archipelagoes. Proceeding southward, we arrive at the great ocean, that is, the Central Desert; and beyond it, still southward, is Soudan or Nigritia, the name given to an immense region little known to Europeans. This is the continent of the black people, bounding the sandy ocean to the south. The fleets which plough these dangerous deeps are the caravans. They are equipped on the shores of the Tell; put in to the islands of the Algerian Sahara, to renew their provisions and trade with the inhabitants; at length they quit these archipelagoes, turn their head southward, and make for the continent of the blacks, whose principal port is Timbuctoo. The caravans that merely pass from one oasis to another are but cruisers; those only which steer for Timbuctoo or the Haousa, undertake what is deemed a voyage. They are organised on a most extensive scale, and supplied with implements of war, on account of the enemies that they may expect to encounter.

The great Central Desert of Falat exhibits considerable portions of surface covered with scanty vegetation; besides these there are stony plains, for the most part

somewhat elevated; lines of dunes, or sandy hills, which are generally, but not always, liable to shiftings; large sheets of perfectly arid and barren shingle; and depressions constituting basins, in which the waters settle that have flowed through the country in the rainy season. The most remarkable deviation from this general character is the famous Djebel-Hoggar, which rises like a large island in the bosom of the sandy ocean. The plateau and peaks of Djebel-Hoggar must be very high, for though it is in the torrid zone, the inhabitants line their dresses with fur, and huddle together under tents covered with skins, to secure themselves against the intense cold.

The driest and most barren parts of the Falat are those where the ground is stony, raised, and steady. Over these tracts the sands often roll in the form of vortices, or settle in temporary hills, which are soon removed by the wind, and rolled down the declivities. They then gather and settle in the hollows above-mentioned: and thus it is easy to explain why vegetation is seldom found in the bottom of these basins—why there is no formation of beautiful oases, as in the Algerian Sahara. If the water is a fertilising element on the one hand, the quantities of sand on the other, passing and repassing over every inch of the soil, is a powerful obstacle to vegetation. The hollows thus present simultaneously the principles of life and death. Even in the Algerian Sahara this antagonistic operation of sand and water on vegetation may be observed; the oases are constantly menaced by sandhills, which advance towards them, encroach by degrees on their gardens, and threaten their very existence.

But the Falat differs from the Algerian Desert, in having much more sand and less vegetation; being subject also to a temperature considerably higher, and liable to severe storms, which sometimes bury whole caravans in the sand. Far also from being studded with frequent and beautiful oases, its wells are often two or three hundred miles apart. And if, as sometimes happens, a storm has blown the sand in such a manner as entirely to cover the wells and springs to which the fainting caravan had been pressing, both man and beast must perish, unless the encumbrance can be cleared away; or the water, having taken another course, be found in some neighbouring spot. In the twenty-three days' journey from Agabli to Timbuctoo, eight or ten are reckoned on without water; and this is the portion of the journey which is most dreaded. If the sirocco overtakes a caravan here, and blows for some time, it dries up the water, and occasions many deaths. But this is not a sandy tract; the soil is composed of a stiff, red earth, which is called *tanegrouffe*.

The palm-tree does not grow in the Falat; and there are some places quite destitute of every species of vegetation. But for the most part we find plants scattered

everywhere, and more thickly in the hollows which have not been invaded by the sand. On the driest tracts, few animals are to be met with; but about the skirts of the Desert, and in the mountains, we find giraffes, ostriches, gazelles, zebras, antelopes, lions, panthers, and serpents. Among the domestic animals are the goat and the sheep—nearly the only ones which thrive in the most inauspicious situations.

The spaces which are utterly dry and barren have of course no settled inhabitants, but are from time to time tracked by caravans or traversed by freebooters. On the other hand, wherever there are found even scanty supplies of water and vegetation, there may be seen groups of tents, sheltering a miserable population whom one might suppose incapable of supporting life on the little share of nature's bounty that falls to their inheritance.

The inhabitants of the Central Desert are called Touareg; Targui being the singular. They are a white people, and are often supposed to be like the inhabitants of Sahara, of the Berebber race. Certainly there are several points of resemblance between them; but the Touareg have habits, manners, and a way of life quite peculiar to themselves. Their language is derived from that of Barbary; but it is a dialect very different from that spoken in the oases. It has a roughness, which has led to its being called the German of the Desert; and seems to approximate most to the language of the Gouanches, the former inhabitants of the Canaries. In religion the Touareg follow Islamism; but they singularly mingle the idolatrous rites of Fetishism with the duties of the Koran.

The Touareg do not compose a tribe merely, but a great nation—the scum, the pirates of the sandy ocean. Driven in all probability at some remote period from the Tell, by the invasions of the conquerors who have successively appeared in Algiers, then expelled from the Algerian Sahara, which they seem to have occupied in early ages, they appear desirous of avenging themselves to this day on the descendants of those who banished their race to the Desert. Their families live in towns to the south-east, along the borders of Soudan, or occupy huts in the Djebel-Hoggar above-mentioned; and here the men also spend the months of winter. But in spring they betake themselves to a wandering life, their occupation being either to transport goods along the line from K'Dames to Demergon, or to rob the caravans on the line from Timbuctoo to Insalah.

In all his expeditions, whether honest or otherwise, the mehari is the inseparable companion of the Targui. The accounts which have been given of the sagacity, docility, and swiftness of this animal are almost incredible. General Marey, who appears to have seen three of them, thinks that the mehari is to the common camel just what a racer is to a draught-horse. The Central Desert is not only its native country, but, it would seem, its exclusive abode. It has very rarely been seen in the Tell, or indeed in any of the more northern parts of Africa; the reason being, either that it cannot be acclimatised, or, as some say, that it dies from eating a poisonous plant called *drias*; which is so like a nutritious one belonging to Falat, that the animal does not perceive the difference, and perishes the victim of its error. It is a dry, nervous, lean, supple, sober, and submissive creature, and allows itself to be guided by means of a long rein, which is either passed through the ring, or hooked to the small metallic trunk which is fastened through the muzzle. His prodigious swiftness is suitable to the immensity of the plains which he has to traverse. The natives divide their meharis into ten classes: the lowest comprehends those which can make about twenty-five of our miles in a day, and the highest those which clear ten times the distance in the same space of time. It is confidently asserted that a good mehari can travel from seventy to eighty miles day after day continuously.

Their mode of rearing this favourite animal is singular. When it is born, they plunge it to the neck in fine, shifting sand, that the delicate bones of its legs may not be bent by supporting the weight of its body; and for fourteen days it is subjected to a prescribed diet, chiefly consisting of butter and milk, of which both the composition and quantity are varied from day to day, according to well-known rules. It is an object of great solicitude that it should have a dam renowned for the rapidity of its movement, for it is a settled point in the Desert that the mehari inherits chiefly the maternal qualities. It is seldom allowed to run till the end of the first month; an iron ring is then passed through its nose, and its education is begun.

The sagacity of a well-trained mehari is no less wonderful than his swiftness. If the Targui chooses, in the midst of a rapid course, to plant his lance in the sand, the attentive animal, cognisant of his master's every wish, turns round the weapon, till the cavalier has succeeded in picking it up again; then, without at all abating his speed, he pursues his course as before. When the warrior falls in battle, his faithful companion does not abandon the field: he approaches the Targui, stretches himself on the sand, like a dog fawning at his master's feet, watches whether he exhibits any sign of life, and appears to invite him to remount his back, and fly from the scene of carnage. If the Targui remains mute and motionless, the mehari takes the way to the town or *douar** where his family reside; and when they see him return alone, the women begin their lamentations for the dead, and the children raise the bitterest cries. The agitation spreads through the village, and all turn their anxious inquiring gaze towards the horizon: some dark spots appear; they increase and approach: these are other meharis without their masters; silently, but too truly, telling that the loved ones have been defeated and slain.

The constitution of the Touareg, like that of their meharis, is dry; and their form so slender, that the appellation of *lath* is given to them throughout the Desert. They are divided into black and white; not according to the colour of their skin, but of their costume. The white Touareg dress nearly like the Arabs, but the black have a peculiar stamp; their clothing, mounting, arms, manners, habitations, are unlike any of their neighbours.

The black Touareg wear pantaloons, like Europeans, confined at the waist with a woollen girdle. They go barefooted, because they scarcely ever walk, but mount their meharis to pass the shortest distance from one place to another. Those, however, who are not rich enough to have an animal to ride on, wear a kind of sandal tied on their feet with strings. They dress in a variable number of vestments, made in the form of blouses, or loose gowns, and composed of cotton cloth, variously striped, and only a few inches broad. This cloth is called *saie*, and is brought from the Negro country. Whether in the town or the camp, they generally wear at least three of these blouses, the outermost of which is ornamented with rich embroidery in gold, forming irregular designs, and particularly heavy on the left breast and the right shoulder-blade. When they betake themselves to the open country, they add other two blouses of a dark colour, and cover the head and neck with a long deep *haick*, or woollen scarf, which leaves only the eyes uncovered. The stuff of which this is composed is covered with a varnish, made from various gums, to prevent the adhesion of the sand. They shave the head, leaving only a long queue behind; and they wear a *chechia*, which disappears under the folds of the haick, so that at a distance the Targui appears like a black spot gliding over the surface of the glittering sand.

When the winter is over, the Targui prepares to tear himself from his repose and his family, and to pursue his marauding career. The fleets of caravans are now

* A douar is a group of tents.

ploughing over the Falat; they must either pay him an impost, and thus gain his protection, or else they must fight their way. He furnishes himself with some scanty provisions, and a leathern bottle filled with water: he arms himself with his long lance, broad two-edged sword, a dagger, enclosed in a sheath attached to the fore-arm, his bow and arrows, and a shield of elephant's skin. Thus equipped for war, he mounts his mehari, bestriding a kind of saddle placed between the hunch and shoulders. He bids a hasty adieu to his family in the act of urging on his courser, which carries him away so rapidly, that he hears not their responsive wishes for the success of his enterprise. He joins the piratical troop, which may number from a few hundred to two thousand men. They march only by night, under the guidance of the stars, and thus suffer much less from the noontide heats, as well as approach the caravan with more probability of being unobserved. Each morning they take their observations, and they can perceive the approach of a caravan at a distance of twenty-five miles at least. Whenever the camel-drivers have left their bivouac and commenced their march, the usual stillness of the Desert is disturbed, not by cries, not even by a vague sound, but by certain vibrations in the air, which can be detected only by the acute senses of the Touareg. The robber-horde advance with caution, and presently a cloud of sand proves they were not mistaken. The attack is fixed for the following morning. But the caravan also has its scouts, who have glided like serpents among the undulations of the sand to reconnoitre the force of the enemy. The main body, encamped around some water-springs, wait with patience the return of the explorers. If it appear that the robbers are so numerous that it would be unsafe to venture alone into the Desert, the caravan remains by the water for several days, or even weeks, or months, till other similarly-destined bands arrive; they then unite, and when the body is large enough, they prosecute their course. If, on the contrary, the pirates do not appear very formidable, the caravan determines to proceed, sure to be attacked, and likely to lose some of their men, as well as loaded camels.

The next morning a glimmering light appears in the horizon, and the disk of the sun comes into view almost immediately afterwards; for in these countries the twilight and dawn are but momentary. The camels lying with their long necks stretched out on the sand are awaked by their conductors, and utter their frightful grumbling. Some with great docility allow themselves to be loaded; others rise and attempt to escape; but a few gentle blows from the driver make them crouch down again. The Sheik-el-Bakal, commander of the fleet, is absolute master of all its movements, and gives the signal for starting when he deems all in readiness. The Menair, who are experienced travellers, acting in the capacity of pilots, take their places in the van, and the whole mass puts itself in motion. The scouts have observed the Touareg retire, doubtless to seek another prey; the marauders gradually fade in the distance, till they are entirely lost amid the warm tints of the horizon.

But the merchants have mistaken a *ruse* of the enemy for a final retreat. The Touareg, learning from one of their own scouts that the caravan is proceeding, approach it after the evening has closed in, clearing perhaps a hundred miles in a single night. At daybreak a hoarse, wild, fearful cry breaks the silence of the plain: it is the signal of attack. A desperate conflict ensues. The sand is the battle-field; and it will be the only grave of the vanquished. Happy those who fall by a mortal blow, rather than be left lingering wounded on the plain! The conqueror would not take the trouble of despatching those he has prostrated; he knows that the Desert will complete the work of death, and that the tedious agonies of thirst and despair are more cruel than any tortures his bitterest vengeance could suggest. After the massacre comes the pillage; and the victorious troop, carrying off their spoil, and

leading away their loaded camels, disappear behind the sand-hills.

In the evening the sand and sky are bathed in lurid colours by the setting sun: these brilliant tints become by degrees brown and sombre; till, in the darkness which veils the heavens and weighs on the earth, nothing meets the eye but a track as of fire in the horizon. In the stillness of night one may for a time hear cries, and prayers, and blasphemies from the scene of the late carnage; but the Mussulman soon wraps himself up in that passive resignation which is one of the leading features of his character; and he will die without a rebellious feeling against the fate which he believes was determined for him by an unalterable decree from the moment of his birth. Some shadows may be seen to move, to creep along, and to fall again immovable: these are the last convulsions of the dying.

A dull sound arises, increases, approaches; the atmosphere becomes unusually dry and heavy; each breath of wind is as suffocating as the blast which escapes from a burning furnace; and the particles of sand, which are lashed into shape, appear to burn like sparks from a crackling fire. It is the *sirocco*! The sands roll their impalpable grains over each other; the surface of the plain ripples at first like a tranquil lake when agitated by the fall of an insect. But the undulations increase more and more; now it may be called a billowy sea; and the vortices rise in the air, turning spirally at the base, spreading like a sheaf at the top, and increasing in their course over the sand, which they worm out by this whirling motion.

The noise again decreases, and at last is entirely hushed; the troubled air becomes calm; and the coolness of night supersedes the hot breath of the *sirocco*. But the sand has engulfed the wreck of the caravan; the moon shines on a level plain; and all is silence and solitude in the Desert!

THE CADET BRANCH.

Two of the cheeriest, blithest ladies of my acquaintance were the Misses Tabitha and Deborah Darvill, who, with their long-widowed, gray-haired mother, resided, a few years ago, in one of the pleasant semi-rural cottages the neighbourhood of London is so thickly studded with; upon an income which, to persons unfamiliar with the magic of a minute and judicious economy, might appear barely sufficient for the mere necessities of life, but which *they* made amply suffice for most of its modest luxuries. Guileless, cheerful-hearted maidens! who that witnessed with what a gentle, loving-kindness you

'Rocked the cradle of declining age'—

how gaily you gossipped, how prettily you played and sung—how sensibly, when you had nothing better to do, you discoursed—could have thought otherwise than contemptuously of the venerable fallacy which connects misanthropy with elderly-maidenhood, and invariably associates singleness at forty with crabbedness and an evil disposition? For myself, I beg to express a firm belief that if Tabby and Debby—familiar domestic brevities these, permitted, be it understood, only to a favoured few—I say I firmly believe that if Tabby and Debby had each blessed three husbands, and been surrounded by a dozen or more cherubs in bibs and pinafores, they could scarcely have been more gentle, obliging, and thoroughly amiable than they actually were. This, I repeat, is my solemn opinion. But coming as it does from a confirmed old bachelor, it must of course be taken *cum grano salis*. One weakness, besides tea, these ladies confessed to: they loved, with an enthusiasm unsurpassed by that of the celebrated Mrs Battle, a sound, quiet rubber of whist—good old constitutional whist, mind; none of your *short* heresies—with its illustrations, 'a clear fire, a clean hearth, and the rigour of the game.' Fortunately they lived in a thoroughly whist neighbourhood. The two

semi-detached cottages that, with their own, constituted the chief street of that young locality, were occupied by two staid widowers; with whom, since the death and burial of their wives, whist seemed the one-cherished object of existence; and hundreds of rubbers were valiantly fought out in that pleasantest of pleasant parlours between the mature maidens and their somewhat ancient neighbours—Mr Peter Danby, and Mr John Dusatoy.

Yes, Peter Danby and John Dusatoy are the names of the gentlemen; but if the reader is to understand clearly this charming little 'histoiette'—that is, if I do not mar it in the telling—something more of introduction than the mere announcement of their names is essentially necessary. Mr Peter Danby—a man of singularly-expressive silence—may be dismissed after his own manner in a very few words. He is a retired drysalter, living physically and morally upon the accumulations, material and mental, of former exertions. The first—the material—are decidedly the most tangible, consisting as they do of between five and six thousand pounds in sundry solid securities, national and joint-stock. The mental capital, though not perhaps so accurately set down, nor so easily reckoned up as consols and debentures, must necessarily be considerable; as, without having added one single item to it within the memory of the oldest inhabitant of the street—who is unquestionably the old lady yonder, nodding so comfortably in her arm-chair over her knitting—he has for many years enjoyed, and still continues to enjoy, a daily reputation from it: a man of powerful action I have no doubt, but of marvellous few words. Many a brave talker, I am told, he has in his time listened down: kept steadily at it, in fact, till the fountain was thoroughly run out. Shortly, to sum him up, and give his brief-total, he is a kind of drysalter-illustration of Mr Carlyle's somewhat paradoxical apothegm in his *Hero as Poet*: 'speech is great, but silence is greater.' His tremendous superiority at whist may be imagined.

Mr John Dusatoy, on the other hand, is essentially a man of words; but unfortunately of such small ones, that a shower of them produces the faintest imaginable impression. A decent, quiet, well-meaning little man, nevertheless, is John Dusatoy. Dusatoy, I repeat, is a very quiet, respectable person; wears a carefully-kept flaxen wig, and has everything handsome and comfortable about him; and, to crown all, a daughter, who—

Yes, sir; positively the young lady seated at the rose-wood work-table, with the beautifully-moulded Grecian head, raven tresses, dark full brilliant eyes—and now, as she rises to snuff the candles for the absorbed whist-players, you perceive, of queenly figure and graceful, elastic carriage—is the little flaxen wig's heiress and only daughter, Geraldine Dusatoy. . . . Well, sir, what of that? I maintain that it is a soap and candle dealer's birthright—his and every man's inalienable, constitutional privilege—to have his daughter christened by any name he pleases. You admit it? That being the case, I don't mind still farther enlightening you. But in order that I should be enabled to do so, you must, if you please, step back with me to just seventeen years ago last Monday evening. A long distance! And now we have got to it, only look what a dark, gusty, sleety, plashy, disagreeable evening it is! Well, on this very evening Mr John Dusatoy was belated at a distance of something more than six miles from his lawful home and wife, situated both of them in one of the large manufacturing towns of the north of England. It was entirely his own fault, I must tell you, that he was thus belated. He might have been home hours before, had he not been fascinated, juggled out of his usual prudence, by a troop of spangled vagabonds, with a black-eyed gipsy girl for their prima donna, who were exhibiting their tricks and tumblings at the 'Golden Fleece,' whither Mr John Dusatoy had betaken himself by appointment early in the afternoon, for the settlement of a rather heavy account. When he at last

rose to depart, he found that he had awfully overstayed his time; and direful were the forebodings which filled his mind as to the reception he should meet with from Mrs Dusatoy—a respectable, but altogether over-eloquent lady, who, John instinctively felt, as he glanced at the hands of his watch, had already heaped up abundant treasures for him. 'Nearly seven miles by the road,' soliloquised the repentant, self-accusing soap-dealer: 'bless me, I shall be two hours or more getting home that way. Through the wood saves nearly three miles; but then it is so plaguy dark, I might miss my way.' He nevertheless resolved to venture. The brandy and water he had swallowed rendered him unusually valiant; and on he desperately staggered, through marsh, and brake, and brier. Rash, rarely successful men are they who wander from beaten paths in search of short cuts to desired havens; and honest Dusatoy proved no exception to the rule. For more than two mortal hours did he wander to and fro in the dark, marshy, perplexing wood; till, worn out, bewildered, terrified almost to death, he sat down upon a damp, uncomfortable stump, fairly overcome with fright and vexation. The imminence of the peril roused him to renewed exertion. 'Man lost!—man lost!—man lost!' he shouted, jumping up, and raising his voice to a dreadfully-cracked pitch, in the desperate hope of attracting assistance. The strange sounds echoed through the stillness of the forest; but no sympathising voice responded to the agonised appeal. 'Man lost!—man lost!' reiterated the perturbed but persistent oil-man with quivering vehemence. This time there was an answer. 'Who—o—o—o—o?' came distinctly down the wind. 'Poor Johnny Dusatoy!' he replied with deprecatory supplication: 'as honest a man as ever broke a bit of bread!' 'Who—o—o—o—o?' again returned the sympathising stranger. Johnny eagerly repeated his description, baptismal, patronymic, and moral, and still the same query replied to his frantic asseverations. On, however, he pressed in the direction of the voice; and, as he conjectured, was not more than a quarter of a mile from the cold-blooded questioner, when, emerging from the tangled darkness into a somewhat clear opening in the wood, he was startled out of his few remaining wits by the apparition of an enormous gipsy suddenly confronting and striding towards him. No wonder his jaws rattled like a pair of castanets, and that he shook in every fibre of his little body: it was—no doubt about it, considering the hour and the locality—a most unpleasant meeting.

'Who is that?' demanded the grim vagabond; 'who is that dialoguing with the owls at this time of night?'

'I—I—I, p-o-o-o-r Jo-ohnny Du-u-u-satoy, as ho-o-o-nest a'—

'Oh, it's you, is it? I'm glad of it, for I thought I had missed you. You are the very man I want.'

'A-a-a-am I?'

'Yes: you are rich and childless; and you must take this one, and bring it up as your own. The girl you saw at the inn has preserved it during the last five or six days at the hazard of her life. The band, for various reasons best known to themselves, will have it destroyed and buried snugly out of the way. I have undertaken the job; but at the request of that girl have promised to deliver it to you; with this distinct understanding, that you bring it up as your own; and above and before all, that you never breathe a word to one living soul as to how you came by it.'

'Ye-e-es.'

'You consent: I am glad of it, as it may save trouble. Now, then, here's a Bible: look and see that it is a real one. Good. Now place your hand upon it, and repeat after me.' Mr John Dusatoy stretched forth his hand, and mechanically repeated the words of an awful oath binding him to secrecy. He then, at the command of the gipsy, kissed the book.

'It is well. Now mark: if ever you reveal to a single human being what has passed to-night, you will be a

dead man before twenty-four hours are over. Come, this is your path.'

Five minutes afterwards, Mr John Dusatoy found himself upon the high road, within ten minutes' distance of his home, with a lusty infant of about two years of age in his arms. His mind was in a state of complete confusion. He certainly had seen such things done in a play, and had read of them in circulating romances, but that a respectable man and a rate-payer should be served a trick of the kind in actual real life seemed utterly absurd and incredible. He, however, moved mechanically homewards, holding the babe nearly at arm's length, something after the manner in which people carry joints of meat to a bakehouse; and had arrived within a yard of his domicile before a thoroughly full sense of the utter desperateness of his condition flashed upon him. If he had before dreaded encountering his amiable partner, how on earth was he to face that determined woman with such a present as *that* in his arms? The very idea of it turned him up and down; and cold and sleety as it was, he perspired like a roasting cook in the dog-days. Long, long he stood irresolute; but at length nerving himself to desperation, he rang the bell. Quickly a well-remembered step was heard upon the passage floor-cloth, and a well-remembered voice exclaimed—'Oh, there you are at last! Upon my word this is very pretty—remarkably so indeed. Aint you ashamed of yourself?' continued Mrs Dusatoy, fairly boiling over, and at the same moment throwing open the door. 'Aint you ashamed?'

The current of her eloquence was checked at once. I gave you my word, sir, that a company of grenadiers charging into that passage with fixed bayonets and bear-skin caps could not have so scared that remarkable woman, as did the blessed babe sustained upon her husband's outstretched arms. She started back dumbfounded, paralysed! Johnny, profiting by the momentary panic of his better half, darted by her, rushed frantically into the parlour, and deposited the infant on the table, exclaiming, as he wiped his teeming forehead, 'There! I swore a dreadful oath I would do it, and I have done it. There!'

The scene which followed must be left to the imagination, which, if a very brilliant one, may possibly do it justice. I can only relate the fag-end of the fray, after the storm had spent itself, and John Dusatoy had escaped to bed. 'Well, Sally,' said the mistress of the house, addressing her confidential maid-of-all-work; 'we cannot throw the brat into the street, so you had better take it and let it sleep with you to-night;' and Mrs Dusatoy, who had been engaged for the last two or three minutes in an unsatisfactory voyage of discovery over the baby's features, endeavoured to transfer it to the arms of her handmaid. But the child would not be so shifted. It clung perversely, but most endearingly, round Mrs Dusatoy's neck, pressing its coral mouth upon her lips, and peremptorily refusing to depart. The good woman's better nature was awakened by the child's appeal. Thoughts of the one, only one sweet bud of promise that had briefly blessed her life, swelled her heart and filled her eyes. 'Never mind, Sally, she shall remain with me to-night at all events.' The next morning, after patiently listening to her husband's explanation, Mrs Dusatoy agreed to adopt the child. It soon secured a firm hold on the affections of both husband and wife; and as the Dusatoys were even in those days comparatively rich, a liberal education was ungrudgingly bestowed upon the beautiful Geraldine—this name was found marked upon a portion of the infant's dress, and was of course retained—and possessed as she was of great natural capabilities, she speedily reflected credit on her instructors. Her birth, or rather her rescue and adoption, Mrs Dusatoy a few weeks before her death unreservedly communicated to the sorrowing, adopted daughter. That knowledge has not, as you perceive, in the slightest degree abated the affectionate respect which she has constantly manifested towards her kind, well-meaning, reputed father.

And now, sir, having, as I trust, fully satisfied your curiosity respecting the young lady at the work-table, you will, if you please, allow me to continue my story without interruption.

The whist-players, then, on the evening in question, were not, it was quite clear, in harmonious accordance. Both Tabby and Debby seemed fidgetty and nervous, strangely forgot what cards were out, and altogether played abominably. Twice Mr Dusatoy, as fresh hands were in course of distribution, had querulously remonstrated with Debby upon not leading the right suit at the right time; and once Mr Peter Danby, after enduring much unwilingly, paused in the midst of the play, laid his cards emphatically on the table, raised his spectacles from his eyes to his forehead, and glared solemnly in fair Tabitha's face with a look which said as plainly as look could, 'Remember, madam, you are losing *my* money as well as your own.' There were four sixpences, I should state, under one of the candlesticks. This done, he replaced his spectacles, resumed his cards, and steadily continued the game.

'Well,' said Miss Deborah at the conclusion of the hand, 'we are playing shockingly; but the truth is, we have been a good deal flustered this afternoon by a letter from General!'

'Lieutenant-General D'Harville,' interposed Tabitha; at the same time volunteering the orthography of the general's name.

'Yes, Lieutenant-General D'Harville,' resumed Deborah; 'and that, it seems, is the correct mode of spelling *our* name, which has been somehow shortened and vulgarised by dear papa's connection with the City. The general reminds us that we are a cadet branch of the family tree. Now what, for mercy's sake, is a cadet branch?'

'It's people that go to the East Indies to serve their queen and country in the capacity of gentlemen,' replied John Dusatoy with confident alacrity.

'Nonsense, Mr Dusatoy. How can Tabby and I, or dear mamma, be people of that sort?'

Mr Peter Danby paused for an instant in the act of shuffling the cards for a fresh deal, and looked with much intelligence at Miss Deborah: he then favoured Mr Dusatoy with another emphatic glance, easily translatable into 'You're a donkey;' he, however, only said, as he placed the pack before him, 'Cur!' Everybody felt that Mr Danby *knew* what a cadet branch was, but that he for the moment declined imparting his knowledge. This was a favourite trick; and indeed one of the chief modes by which he raised and sustains his great reputation.

'I believe,' said Geraldine, coming, as usual, to the rescue, 'that a cadet is a younger brother, and I suppose his family might be called the cadet branch of the house?'

'That explains it, dear Geraldine,' cried the spinsters both in a breath. 'Quite. Well, who *would* have thought it?'

General Sir Frederick D'Harville had in fact written a curt stately note, informing Mrs D'Harville—corruptly spelt Darvill—that having lost his only son about a twelvemonth previously in one of the great Indian battles, he and Lady D'Harville had determined to adopt one of their nieces, and bestow her handsomely in marriage, in order, as better could not be, that the ancient family might be continued and perpetuated through the cadet branch. He would call, for the purpose of escorting his niece to Maida Hall, on the morrow about noon.

For obvious reasons, the entire contents of this strange missive were not communicated to the company; but enough transpired to convince the widowers that a dreadful blow had been aimed at the peace of the card-table; and that, moreover, any further play even on that evening was out of the question. Mr Peter Danby rose, quietly placed his broad-brimmed hat on his deliberate head, drew on his gloves, buttoned up his coat, bowed comprehensively, and stalked forth in accusing silence.

Mr Dusatoy and his adopted daughter departed half an hour later.

Alas, there was more, much more in danger than the whist-table! Pope was quite right: in these days the Evil One tempts, not by poverty, but riches. For the first time Tabby remembered with bitter malevolence that Debby was three years her junior; and Debby, for the same reason, exulted ungenerously over her sister. Twelve hours before, neither of them would have believed in the possibility of such feelings arising within their gentle bosoms; so sad was the change wrought by the glittering bait, present and prospective, set before them by their crafty uncle the lieutenant-general.

The general arrived the next morning in great state. He was a fine military-looking man, and was indeed possessed of many admirable qualities; but all dimmed and obscured, to the superficial observer at least, by overweening pride of birth and lineage, and haughty superciliousness of manner. He was ushered into the front parlour by the awe-struck maid-servant; and a minute afterwards, Geraldine Dusatoy, blushing, and somewhat embarrassed, but losing nothing of her native grace and dignity of manner, entered to apologise for the momentary absence of Sir Frederick's nieces.

The instant the general's eye fell upon the form of the beautiful girl, he started from his chair with strange emotion; and advancing rapidly towards her with extended hands, exclaimed in a tone of joyful surprise, 'My niece!' Geraldine explained, and Sir Frederick's countenance immediately fell. He did not, however, relinquish her hand, and continued to gaze at her with a troubled, inquisitive glance. Presently the door opened; 'Miss Deborah D'Harville,' said Geraldine, very much embarrassed, and anxious to divert the general's attention from herself.

'It is very strange,' muttered Sir Frederick, gently yielding Geraldine's hand, and turning mechanically towards Deborah: 'Who is this young lady?'

'Geraldine Dusatoy—a neighbour.'

Tabitha now entered; and Sir Frederick's attention being necessarily given to the sisters, Geraldine Dusatoy adroitly slipped away, much wondering at the general's strange behaviour.

General D'Harville's reception of his nieces, as soon as he recovered his rarely-disturbed self-possession, was kind and courteous. It was soon arranged that Deborah, as the youngest, should succeed to the vacant niche of heiress to the House of D'Harville; and preparations for immediate departure were at once commanded. I will not say that the general's hopes and anticipations were not somewhat damped by the perusal of the record of mature age stamped upon the countenance even of his youngest niece; but he by no means despaired of the stability of his ancient House. He was a man of singularly sanguine temperament, and had in his youth led two forlorn-hopes.

Arrived at Maida Hall, Deborah was introduced to her stately aunt, Lady D'Harville—a tall, splendid, but apparently a grief-stricken woman. 'Surely,' thought Deborah, 'I have seen that face before. Oh, to be sure. If she were twenty years younger, and happier looking, she would be the very image of Geraldine.'

Lady D'Harville received her niece with a cold, sad smile; and Deborah, after a few frigid words of course, was consigned to the care of her appointed attendants.

'Your niece's education, Sir Frederick,' said Lady D'Harville as soon as Deborah had left the apartment, 'has, I fear, been sadly neglected. You will have enough to do to render her presentable at the next drawing-room.'

'Yes: there is no time to spare neither. At all events, she has good blood in her veins. We must make up for lost time as well as we can.'

The result of the general's resolution to make up for lost time is very clearly set forth in the following epistle received by Miss Tabitha about a fortnight after her sister's departure:—

'MAIDA HALL.

DEAR TAB.—If you still feel any desire to be a great heiress, and live in state, get your things packed up ready; for, please goodness, I'll put up with the life I'm leading here no longer; no, not to be cadet branch to Queen Victoria! The general comes home to-morrow evening; and if he wont take me back in the carriage, I'll run away! Why, Tabby dear, you can have no conception of the torments and martyrdoms I have been made to endure, in the hope of transmogrifying me into a fine lady. But it's no use, Tabby dear—not the slightest: it's not in me, and that's the honest truth. First of all, as early as seven in the morning, I'm drilled for three-quarters of an hour by Sergeant Pike, in order to make me keep my shoulders back: after breakfast, my French and Italian masters take me in hand for an hour each: then come the piano and harp professors, and I am made to thump and twang away till luncheon-time: directly that is over, Monsieur Pirouette, the dancing-master, exercises me for two mortal hours: and when he has concluded, it is time to surrender myself into the hands of Mademoiselle Angélique, to be screwed up, frizzed, and plaited for dinner. Ah, Tabby, if I could once see that dear Angélique upon the bare back of our donkey, and I bind with a good switch in my hand, *wouldn't* I— But no matter, here I wont stop, that's poz! The cadet branch and posterity may shift for themselves for what I care; I'll have no more of it, and so you may tell dear mother; and believe me, Tabby, your affectionate sister in affliction,

DEBORAH DARVILL.

'Yes, Darvill! good, honest, downright Darvill! The deuce take their H's, and their E's, and their apostrophes, say I, for ever and amen!'

Tabitha and Geraldine Dusatoy were still occupied on the following morning commenting upon this portentous letter, when the general's carriage was seen to drive furiously up to the garden gate, and presently out sprang Deborah, before the door was well opened, and came running frantically up the gravelled path towards the cottage. In she burst, hot, panting, and impatient.

'God bless you, Tabby; here's an uproar, and all of my making! Geraldine, don't be frightened; there's a dear: but as sure as you're alive, you are an elder branch, or worse. Turn down your left shoulder, and you'll see. The general had been talking to his lady about your uncommon likeness; but there, poor soul, you don't know anything about it; and I happened to let out that you were a "babe in the wood," suckled by gipsies seventeen years ago, and that your name was Geraldine; and if Lady D'Harville hasn't been going on distractedly ever since, wringing her hands, and walking in her sleep like the lady in the play. Oh, here she is.'

Lady D'Harville, supported by her husband, here entered the room in a terrible state of agitation. The instant she saw Geraldine she sprang wildly towards her, and clasping her in her arms, exclaimed in a choking voice, and with frenzied eagerness, 'It is she! I know it—feel it! Oh, God would not so deceive a mother! Quick—quick, if you would not see me die! Her left shoulder—three moles triangularly placed!'

'It is she!—look here!' shrieked Sir Frederick with wild excitement, and at the same time seizing the astonished Geraldine in his arms. Lady D'Harville slid down on her knees, and with clasped hands and streaming eyes raised towards Heaven, ejaculated in broken accents, 'Thanks, Father of Mercies, thanks!'

The explanation which, as soon as the excitement had in some degree subsided, was gone into, proved perfectly satisfactory. Maida Hall had been broken into and plundered a few days previous to the night on which John Dusatoy had duetted with the owls, by a band of gipsies, and the child carried off, in the expectation, it was conjectured, of obtaining a reward for its restoration. The pursuit, however, was so hot, that the band must have feared to afford any clue to the

detection of the authors of the burglary by any negotiation of the sort; and hence doubtless their resolution to put the child out of the way: a design happily frustrated by the compassion of the gipsy girl, and the opportune appearance of Mr John Dusatoy at the 'Golden Fleece.'

Matters were speedily arranged: Mr Dusatoy parted regretfully with Geraldine; but both were consoled by the frank and cordial invitation the honest man received from Sir Frederick and Lady D'Harville to visit Maida Hall as frequently as he found it convenient and agreeable to do so. A large addition to the income of Mrs Darvill and her daughters was also spontaneously offered by the general, and of course gratefully accepted.

Sir Frederick, Lady, and Geraldine D'Harville departed just as the shades of evening began to fall. Half an hour afterwards, the candles were lighted, the card-table again set out—Mrs Darvill was wheeled closer to the fire, and the accustomed four once more seated themselves at their beloved board of green cloth. Deborah, enfranchised Deborah, all smiles and sunshine, having shuffled the cards, waved them in the air with a gesture of exuberant triumph, and then, bringing them down with a flourish, plump before Mr Peter Danby, exclaimed, 'Cut!' 'With all my heart,' rejoined Mr Danby, suiting the action to the word. 'Hurra!' This unwonted outburst added of course considerably to the excitement, which, however, completely subsided during the progress of the deal. 'Play!' cried Tabitha. Deborah played, and on went the solemn game; and on it is going to this day, as any lady or gentleman who can procure an introduction may easily satisfy him or herself on any evening during the week, 'Sundays excepted.'

HYBERNATING QUADRUPEDS OF BRITAIN.

A BEAUTIFUL dispensation is observable in the hybernation of such creatures as feed entirely on insects, or on the more delicate parts of vegetable structures. As soon as the blasts of winter destroy the substances which are essential to their support, they (for the most part) bury themselves in the ground, as in the case of the hedgehog; or roll themselves in a soft warm coverlid of moss and fibres, as in that of the dormouse. The bat, however, is an exception to this rule; it merely 'puts itself by,' as it were; suspending itself, for this purpose, by the hinder-legs to the roof of a dark cavern, or the rafters of some deserted castle or neglected church, where it quietly sleeps, until the warm sun calls forth from their chrysalid tombs the moths which serve it for food. Let us glance at the habits of the winter-sleepers peculiar to these islands.

Being possessed of a most sensitive acuteness of ear, the rest of the bat might be frequently broken, and its senses roused to a feeling of hunger, which it had no means of satisfying, were it not for the curious apparatus by which it can at pleasure close the aperture through which sound is conveyed. This consists of an integument resembling a small ear, placed backwards, at the entrance of the larger or real ear, which acts at will, in the manner of a valve. Some species of bats are distinguished by very large ears; while in others, as the vampire-bat, it is small; but this aural appendage is observed in all. The body of the common bat is somewhat smaller than that of the mouse, which it much resembles in form and colour, though the fur of the latter is lighter than that of the bat. The face is like the visage of a faery mastiff; and though its cry seems but a faint piping, yet if it be held close to the ear, it sounds like the miniature bark of a dog: the wings are formed by the continuation of the skin of the back and breast down the fore-arms, encasing the finger-bones, and extending along the body to the legs, and again to the tail; and thus the order of bats has been appropriately named Cheiroptera, from two Greek words signifying hand-wings. We say appropriately, for when the bat spreads its wings, it has the appearance of extending them with its hands, as a lady

would do with a shawl which was placed on her shoulders, and which she was about to wrap around her. The wings are black, and of a leathery texture; the front point of each is furnished with a hook, with which the animal supports itself when not about to retire to sleep. By means of these wings, it is enabled not only to follow the evolutions of the insects on which it preys, but to sweep them together by a forward semicircular movement, so as to bring them more within reach. The mother also folds her wings round her young whilst suckling them. The manner in which the young are carried about by the parents is exceedingly curious: the former attaches itself by the hind-claws to the breast of the mother, and in such a way, that when the latter flies about with her burthen, the back of the young one is downwards.

The food of the bats consists of those countless tribes of insects which come abroad in the warm twilight of a summer's evening; hence their scientific name *Vespertilio*. They drink on the wing, in the manner of swallows, and frequent the margin of waters, on account of the large number of insects which abound in such places. Bats are excessively sensitive; so much so, that Spallanzani considered them to be possessed of a sixth sense; for they avoided objects placed in their way, when deprived by him of eyes and the power of smelling. This delicacy of perception seems to exist principally in the membrané of the wing. An instance of the acuteness of all their senses is observable in the rapidity with which they turn, if, when flying low, two persons, placing themselves a few yards apart, alternately raise their hands as the animals approach, which will cause them to fly backwards and forwards incessantly; this being what we, as children, used to call playing 'living battledore and shuttlecock.'

It is stated that there are fourteen distinct species of bats in Britain. Of these the most common are the nocturle (*V. nocturla*), which is mostly found in trees, though sometimes in houses also; as is the whiskered bat (*V. mystacus*), the long-eared bat (*V. auritus*), which attaches itself to churches, where it hangs in clusters from the joints of the rafters like swarms of bees. We must not, however, omit to mention, that though bats frequently congregate together in this manner, they never fly abroad in flocks: the pipistrelle (*V. pipistrellus*), which dwells mostly in caverns; and the barbastrelle, which is rare, and which is said to have no odour—which certainly is not the case with the others.

If we consider the anomalous position in which these animals were placed in the eyes of our forefathers, we shall not feel surprised at the superstitious feelings with which they were regarded. Flying with the wings of birds, yet bearing the head and fur of quadrupeds; pursuing the insect tribes, and eschewing the ground, yet bringing forth and suckling their young; rejected of the earth and air, shunning the pure light of the sun, dwelling in dark and haunted places, serving as a prey to no creature save the ominous raven or the solitary owl, and appearing only at the hour of spirits, these observers of old, who were at once accurate and superficial, could not but regard them with suspicion; and thus we find, as Mrs Jameson remarks, that while angels were represented with the wings of birds, malignant spirits bore those of bats. The bat is easily tamed, and becomes an amusing and familiar pet. Mr Bell mentions one which, being set at liberty in the parlour, would, if a fly were held between the lips, settle on the cheek of its young patron, and take the insect with the greatest gentleness: and so far was the familiarity carried, that when either of his young friends made a humming noise with the mouth, in imitation of a fly, the bat would search about the lips for the promised dainty.

The squirrel (*Sciurus vulgaris*) is undoubtedly one of the prettiest of our native quadrupeds, whether we consider the brilliancy of his black eyes, the beauty of his red back and white chest, the luxuriance of his bushy tail, or the agility and grace of his playful movements; so may he in one particular lay claim to being one of the most singular. We allude to his bird-like propensity for building his nest in trees. Choosing a convenient spot, he

lays the foundation in the fork of the branches, and there he brings moss, leaves, and twigs, with which to make a structure which will resist the most violent storms: he makes it with a dome, as the wren forms hers, and leaves only a small aperture near the top for ingress and egress. And if not more interesting, it is at least more amusing to watch him (or we should say her) during the time of building; for she well knows that no bird's patience will be required for the purpose of sitting on eggs, and the labour, though not one of greater love, is one of more careless glee: and the little animal becomes so buoyant with delight at each addition to the nest, that it would appear as if no gambols were sufficiently eccentric to express her joy. We, not having been born in the days when evil spirits roamed at large upon the earth, have a great partiality for bats; but it is a grave and staid fondness—a regard associated with lonesome caverns and ruined buildings, with tombs and spirits—a feeling which makes us sad, yet most calm. Not like this is our love for the bright and joyous squirrel—a love which calls back childish thoughts and feelings, and makes the very throbbing of our hearts imitate the antics of the exulting animal. And then what intense pleasure it gives us to see the little creature sitting with a fir-cone between its paws, picking out the seeds with his long front teeth, and eyeing us sideways all the time with an expression of the utmost roguery and fun; or perhaps, as we approach a little nearer, chattering and scolding in the fiercest manner possible: for he is a courageous little fellow, and very daring when he knows that we only are near; as if persuaded that he had discovered our nature, and knew that we would not hurt him, and therefore he defies us. But only let a gun appear, or a schoolboy approach within a stone's-throw of the tree, and down goes the hero: the hitherto pert tail is extended as flatly on the bough as the trembling body, and there he crouches, close and motionless, until the danger is past.

But the fir-cone is not his only food: the nut, the acorn, the beech-mast, and a variety of similar fruits, are devoured by him, as well as the young buds of trees, with occasionally a few grains of corn, or a blade or two of grass. Jesse has stated that squirrels catch and devour birds, but this appears to have proceeded from some unaccountable mistake, which a glance at the teeth of this rodent animal will at once disprove. That squirrels will pursue birds with great vehemence, we are perfectly aware, for we have seen them so engaged, more especially in the building season; but this is caused merely by some little passing jealousy or annoyance; and it is quite as common to see the squirrel chased by the bird. Notwithstanding the fun and frolics of the squirrel, it is a provident and careful little creature, which lays up in a hollow tree, or some similar cavity, a store of nuts, acorns, &c. for the dreary days of winter, or rather for the bright sunny days with which the winter is occasionally enlivened; for on such days the mild air partially rouses the little sleeper, who peeps out to see if the glad spring is near, nibbles a nut or two, and goes to sleep again. Somewhat allied to the squirrel is the dormouse, the soft-furred little emblem of sleepiness. It is of the same family, and resembles it in the length of its tail, its colour, the agility of its movements, and the brightness of its eyes; though the form of its teeth appears to connect it more closely with the mouse family (*muridæ*). It also, like the squirrel, lays up acorns, nuts, and other fruits of this description for the winter, on the approach of which it rolls itself in a warm ball of moss, from which it emerges occasionally to take a little food, and then rolls itself up again. The nest of this pretty little animal is formed in the hollow of a tree, or in the roots of a bushy shrub, and is thickly lined with moss and leaves. There are few animals which are so easily tamed, or which appear to be so completely happy in confinement. Accustomed, when in a state of nature, to the most secluded and most beautiful forest coverts, it appears, when in captivity, as if it knew not a thought or wish beyond its cage, felt not a want, except for food and materials for its hybernaculum, and experienced not a regret for its free birthplace. And it soon becomes so sophisticated,

as to find a piece of lace or a handkerchief quite as convenient a substance to be nibbled up for a winter coat as the freshest, greenest moss.

The harvest-mouse (*Mus messorius*) is the smallest of our British quadrupeds; measuring from nose to tail two inches and a-quarter, four-fifths of which measurement is occupied by the tail. It was first brought into notice by White, the Selborne naturalist, who thus describes its nest:—‘They breed as many as eight at a litter, in a little round nest composed of the blades of grass or wheat. One of these nests I procured this autumn, most artificially platted, and composed of the blades of wheat; perfectly round, and about the size of a cricket-ball; with the aperture so ingeniously closed, that there was no discovering to what part it belonged. It was so compact and well filled, that it would roll across the table without being discomposed, though it contained eight little mice that were naked and blind. This elegant instance of the efforts of instinct was found in a wheat-field, suspended in the head of a thistle.’ It also builds in the stalks of the growing wheat. The nest—

‘A wee bit heap o’ leaves and stibble,
That costs it mony a weary nibble!’

is nicely lined with delicate fibres, and the young are ready to leave it by the time the corn is ripe and the straw is cut down. In the winter, the harvest-mouse, if not comfortably located in a corn stack, retires into the ground, where it forms a bed of dry grass and leaves. It is one of the prettiest little creatures possible. It is very slender, and most graceful in its movements, running up and down the blades of wheat with the utmost agility and lightness. Professor Henslow particularly notices the prehensile properties of its tail, which is serviceable to it when climbing. He says that he kept one of these little animals in a large deep earthenware pan for more than a year. In the centre of this pan was fixed a perpendicular stick, up which the mice would run, and then slightly bending the tip of the tail round it, they would slide down with great rapidity. When they reached a knob in the stick, they would quickly untwist the tail, and immediately coil it round again. It is a most cleanly creature, and spends much time in brushing its face, ears, &c. with its paws.

The water-rat (*Arvicola amphibus*), or vole, as it is sometimes called, is certainly the most unconquerably shy of all our native quadrupeds; yet if we can sufficiently accustom it to our presence, it is a most entertaining little animal: now darting from beneath the broad leaf of the water-lily, and swimming a little way down the stream; now concealing all but its head under water, while it fixes its sharp eye on us, and nibbles a few blades of river-grass; now ascending the bank, and indulging in a few gambols

‘On the happy autumn fields;’

and finally, on the slightest alarm, disappearing with the rapidity of lightning into the matted roots which hang over the stream, or diving until the danger is overpast. In form it is allied to the common rat; but the structure of its teeth places it amongst the family of beavers; its fur, which is of a dark red-brown, is very thick and warm. It makes its nest, in which it also sleeps through the winter, in the holes and interstices of the river bank, where it frequently brings up six or eight young ones. It is extremely expert in diving for minnows and other small fish, as well as in catching frogs, for the spawn of which it seems to have a great liking.

Perhaps few animals have in all ages been greater objects of superstition than the shrew (*Sorex*). The Egyptians paid it divine honours; and the mummies of two distinct species have been discovered, in a state of perfect preservation, in the crypts of Thebes and Memphis. Of these there are twenty specimens in the collection of Egyptian antiquities in Paris, belonging to M. Passalagna. It was worshipped in the Athribitic district of Egypt, and was sacred to Latona. The extreme smallness of its eyes caused its dedication to one of the gods of darkness and concealment. Aristotle, Pliny, and

Agricola, declare its bite to be dangerous to horses and other beasts of burthen; the last recommends, as a remedy, that the little animal should be cut asunder, and applied to the wound. In France, and even in our own land, it has been believed to paralyse any animal over which it runs; in this case 'planet-struck' and 'shrew-struck' appear to be synonymous terms; and Bingley states that the prescribed cure was 'to drag the animal through a piece of bramble that grew at both ends.' White also speaks of a pollard ash which was highly regarded as a shrew-ash. 'Now a shrew-ash is an ash whose twigs or branches, when gently applied to the limbs of cattle, will immediately relieve the pains which the beasts suffer from the running of a shrew-mouse over the part; for it is supposed that the shrew is of so baneful and deleterious a nature, that whenever it creeps over a beast—be it horse, cow, or sheep—the suffering animal is afflicted with cruel anguish, and threatened with the loss of the use of the limb. Against this accident, to which they were continually liable, our forefathers always kept a shrew-ash at hand, which, when once medicated, would keep its virtue for ever. A shrew-ash was thus made:—Into the body of the tree a deep hole was bored with an auger, and a poor devoted shrew was thrust in alive; and plugged in no doubt with several quaint incantations now forgotten.'

The shrew has an extremely long nose, which is pointed and overhanging. This appears to be of use in burrowing and digging for its food, which principally consists of insects, grain, and other miscellaneous substances. The common shrew (*S. tetragonurua*) measures about 2½ inches from the nose to the tail. This tail is somewhat quadrangular, from which the name is probably derived. It is of a mouse colour, and not reddish-brown, as has been frequently stated. The nest is usually formed in loose heaps of stones, ruined walls, or, not unfrequently, in the clefts of broken ground. We have often remarked great numbers of these animals lying dead in the fields and lanes in the beginning of the autumn: their death appears to have been a natural one, and always to occur at the same period of the year. The upper fore-teeth of the shrew are of a peculiar formation, having an extremely minute barb on each side. The water, or long-tailed shrew (*S. fodiens*) is larger than the last-mentioned, and is extremely rare in most parts of our island. The form of the two species is very similar. It is an excellent diver and swimmer, and is so excessively shy, that it is seldom seen. They usually make their homes in the banks of rivers and streams. They are merry, sociable, little things, who spend a great portion of the day in play.

It is a common error to regard the shrew as a 'kind of mouse'; whereas it belongs to the order Insectivora, which includes the hedgehog and the mole. The first of these, the common hedgehog or urchin (*Erinaceus Europæus*), is well known, on account of its armour of prickly points, and also from the peculiar faculty which it possesses of rolling itself into a ball when attacked; or, to speak more correctly, of withdrawing its head and legs within the muscular envelopment of the back; in which state it receives no injury from any fall, however great the distance may be. Like the shrew, it has been the object of many superstitious fancies; the greater part of which, however, are of a curative, instead of an injurious nature. 'All plants,' says the 'Journal of a Naturalist,' 'producing thorns, or tending to roughness, were formerly considered to be of a drying nature, and upon this foundation the ashes of the hedgehog were administered as a great desiccative.' Pliny prescribes the gall of a hedgehog, mixed with the brains of a bat, as a depilatory: while Albertus Magnus declares that the oil in which one of its eyes has been fried, if kept in a brass vessel, will endow the human eye with the faculty of seeing as well by night as by day; an economical substitute for a lamp which must have been very useful to this learned seeker of the Philosopher's Stone, as that valuable substance did not deign to bestow any portion of its riches on those who studied its materials. Perhaps this was one of the valuable ideas given to him by his far-famed speaking head

of brass. In modern times, the hedgehog has been used as an article of food, though it has quite now fallen into disuse in England: it was (and still is, on the continent) generally roasted or made into a pie, and was considered best in the month of August. The skin, with the spines on it, is constantly used in country-places as a muzzle to place on the noses of calves, for the purpose of weaning them; and before the cultivation of teasels was carried to any extent, this skin was found serviceable as a carder of hemp.

The hedgehog is a nocturnal feeder, and extremely timid, for which reasons it is but rarely seen; though it exists in great numbers even in the cultivated districts, from which the generality of our native quadrupeds have long been banished. The food of the hedgehog consists principally of insects and worms; we say *principally*, because its alleged propensity for eggs and young birds has given rise to much controversy amongst naturalists; and as we have had no opportunity of proving the question, we leave the decision to those better qualified to make it. That the hedgehog destroys and devours snakes, has been satisfactorily shown by the Dean of Westminster, and none can deny that animal matter is occasionally consumed by it; yet the habit of hybernating seems very unusual in a carnivorous or an omnivorous creature.

The nest is formed amongst the roots of bushes, in the most secluded coverts; each nest contains from three to five young ones; they are born blind; and their spines, which are white, become hardened two or three days after their birth. In winter the hedgehog burrows, though not to any depth, in the ground; and before establishing itself in its retreat, it weaves itself a warm coat, by rolling amongst the dry leaves which lie on the ground; and which, adhering to the prickles, form a large ball, which appears as if entirely composed of some vegetable and inanimate substance. It is difficult to account for the universality of the belief that this animal commits a robbery by sucking the cows, unless it be from the attraction the cowhouse presents to it in the swarms of flies to be found there; while a glance at the small size of its mouth must at once show the fallacy of the idea. It is, notwithstanding its retiring habits, easily tamed; in which case it becomes very useful in a garden, as it devours a great number of depredating insects. We once knew one which was perfectly domesticated, and which would lie for hours partly drawn within its coat of mail, but with its head and cunning eyes peeping out and watching for the children, who brought it flies. When one was held out to it, it would wake up very briskly, seize the proffered morsel, and then return to its state of dreamy contemplation.

As the mole is commonly regarded as a hybernating animal, we shall include it in this paper; though at the same time we most heartily concur with those naturalists who affirm, that though the mole probably sleeps for a greater number of hours each day in the winter than it does in the summer, yet it cannot properly be called a winter-sleeper or hybernator. That it retires deeper into the ground is indeed true; but in this its movements only follow those of the grubs and worms on which it preys. During the past winter, 1848–49, we have observed the moles at work every day: this will perhaps be attributed to the unusually mild weather which they experienced; but even in the most severe seasons, the approach of a thaw brings with it fresh mole-hills; a fact which may be accounted for by the radiation of heat from the earth, by which the moles feel the genial change before we do. Keen and accurate observation is the only instrument by which a controversy of this kind can be determined; but analogy is certainly in favour of the non-hybernation of the mole; for no animals hybernate save those who are with difficulty supplied with food in the winter days. The mole feeds almost exclusively on earthworms and grubs, which in winter bury themselves deep in the ground; therefore we may reasonably conclude that the mole does not hybernate.

There are perhaps few animals whose form seems better adapted to the circumstances in which their mode of life places them, or less calculated for movement in any other

sphere, than the moles. The strong, hand-shaped claws would, with their out-turned palms, be found almost useless on the surface of the ground, though perfectly contrived for excavating, as well as for moving in the burrows, in which these creatures are born and die: the short leg, heavy and keel-formed breast-bones, and shapeless body, which, above ground, seem almost incapable of movement, travels at an incredible pace when under it; nay, even the diminutive eye, and the texture of the fur (which lies smoothly, whether stroked backwards or forwards), are instances of the same adaption of form to habit which we see in the wings of the bird, the swiftness of the hare, or the armour of the hedgehog.

The mother mole hollows out her nest not under the small hillocks which we see in the fields—and which are merely the accumulations of earth made in, and rejected from, the galleries—but under a larger one, which is placed in the shelter of a hedge, a wall, or the roots of a tree. Here she raises a mound, on the flattened top of which she lays a little bed of dried grass, and deposits her young. This apartment also serves as a sleeping-room for the parent during the winter; but in the summer it generally reposes in one of its open galleries. When one district or pasture-ground is exhausted, the moles usually migrate to some fresh field; and it is stated that in so doing they frequently cross large rivers. The mole displays great and heroic devotion as a spouse or a mother. An instance is on record in which a female having been caught in a trap, the male was discovered lying dead beside it: few, we think, would imagine that the heart of a mole was so easily broken, or that his love was so strong. The eyes and the organs of hearing are so minute in this animal, that it was not formerly supposed to possess either, though men soon discovered that its sense of hearing was remarkably acute—

‘Tread softly: let not the blind mole
Hear thy foot fall.’

Such are a few habits of those animals of our own land which sleep ‘the winter through;’ but there is one common, we believe, to them all, which we state in conclusion, because it is so beautiful an illustration of the instinct by which their Creator leads them. We allude to the care with which, when they store up grain for their winter supply, they bite out the embryo or growing point of the seed, so as to prevent it from germinating, and thus becoming worthless.

PAUPERS AND CRIMINALS.

ONE can scarcely look over a newspaper without perceiving indications of a growing feeling that the recently-fashionable doctrines respecting paupers and criminals act injuriously on society without being beneficial to the parties commiserated. Humanity is felt to be not less commendable than ever it was, but not that blindly-inconsiderate humanity which almost obliterates a sense of justice. The indiscriminate relieving of paupers with weekly doles of money, no matter how the paupers have brought themselves into a state of wretchedness, no matter how they misspend the means placed at their disposal, is found *not to answer*: it is found to manufacture pauperism at so rapid a rate of increase, as to appear to be going on to an absorption of all the available resources of the country, leaving a nation of beggars instead of independent labourers.

England, by its workhouse test, more or less stringently applied, may be said to have escaped the consummation here hinted at; but Ireland and Scotland are too surely gravitating into an abyss of pauperism, and their case demands the most earnest consideration. A few facts will show the working of the new Scotch poor-law:—

In the year ending 1st January 1836 the sum expended on the poor did not exceed L.171,042: in the year ending 1st February 1846 it amounted to L.295,232,

an increase of L.124,190 in ten years: in the year ending 14th May 1847 it was L.433,915, being an increase of L.138,683 in one year: in the year ending 14th May 1848 it was L.544,334, being again an increase of L.110,419.

The number of poor on the rolls at 1st February 1845 was 63,070, or about 1 in 42 of the population: on the 1st February 1846 it was 69,432, or about one in 38: on the 15th May 1847 it was 74,161, or about 1 in 35·3. The total number of paupers of all sorts relieved during that year was 146,370, or about 1 in 17·8 of the population. On the 14th May 1848 the number of poor on the roll was 77,732, or 1 in 37·7 of the population. The total number relieved during that year was 227,647, or 1 in 11·51 of the population.

Besides the evil of an enormously-increased expenditure, there is a rapid deterioration in the general character of the labouring population. This is forcibly stated in a Report by a Committee of Commissioners of Supply for the county of Peebles:—‘The aversion, which was almost universal in rural districts, to relief from the parish is now unknown. The provident habits of the people are giving way, and their friendly societies for provision against sickness are in many instances dissolved; and it is not unlikely that a few years will witness the complete extinction of these beneficial institutions all over the kingdom. Families no longer show any desire to maintain their parents in old age; and from the facility with which illegitimate children are thrown upon the parish, a direct encouragement is held out to immorality, and to the indefinite extension of pauperism. In one word, the working of the law, as it stands, removes all stimulus from the labouring population to exercise habits of industry, frugality, and foresight, and acts as a positive incentive to carelessness and improvidence.’ Such are the unfortunate effects of an act of philanthropy which is now perceived to have proceeded on too favourable a view of human nature.

And so with regard to criminals. A few years ago the national mind was all for tenderness, kindly treatment, reformation. Severity was scouted as unchristian, inhuman, calculated to strengthen rather than weaken evil dispositions. Then was established that beautiful organisation of prison discipline which gave to each delinquent a neatly-furnished apartment to live in, with all the comforts of elegant seclusion. The object was amiable; it was designed as a correction by humane means. Has this end been accomplished? Alas, no! It is found that while you possibly operate beneficially on a few, you give the bulk rather a taste for imprisonment: they contrast the comforts of their cells with the wretchedness of their ordinary garrets and cellars, and act accordingly. In short, the prison has lost its terrors, and the result, as might be expected, is an expansion of the criminal class.

Besides the great Central Prison at Perth, which may be called Downdraught-General for Scotland, each county has been put to an immense expense for palace prisons. One of these establishments, erected near Cupar, for the county of Fife, we some time since had an opportunity of visiting. Nothing could be more perfect in its way: it was a ‘Pentonville’ on a small scale. The Fife Prison Board has just issued a memorial respecting the operation of this institution, in which they present a variety of facts worthy of earnest consideration. After making every allowance for turbulence at railway works, increased vigilance of police, &c. they regret to arrive at the unavoidable conclusion that ‘crime, even amongst the permanent population of the county, has been materially on the increase. To reach some proximate idea how the present prison system has worked in deterring from the repetition of crime, it may be stated that in the county prison at Cupar the recommitments have been nearly in the following proportions:—for the second time, 1 in 11; third time, 1 in 44; fourth time, 1 in 144; fifth time and

oftener, 1 in 216. In Dunfermline prison the proportion for the second committal has been much the same, but greater for those beyond that number. The County Board believe that these statistics show a smaller average of recommitments than the returns of Scotland at large, but still they substantiate the inefficiency of the present system of prison management in preventing the repetition of crime.'

With regard to incarceration, as now regulated, 'they consider that the system aims too indiscriminately at reformation, without reference either to age or length of sentence.

'It must be acknowledged by all who have thought upon the subject, that it is almost impossible to over-estimate the importance of a first punishment on the subsequent character of an offender; and hence the necessity for its nature and severity being such, according to the age of the criminal, as will deter both him and his associates from the commission of crime: this the present system is not fitted to do.

'In their own prisons not only has the separate system become impracticable, but frequently two or three male prisoners are confined together, which, in an apartment heated and ventilated according to the present regulations, and supplied with wholesome food, and allowed entertaining reading and conversation, is not only no punishment, but in their opinion positively holds out a temptation to the commission of crime. And even were the separate system practicable, the County Board believe the comforts enjoyed in prison, in point of cleanliness, food, and lodging, to be so superior to what the majority of the working-classes can command in their own dwellings, or the lodgings which they frequent, as entirely to annihilate the moral effect of incarceration as a punishment. Indeed several prisoners in the county of Fife have admitted that their comforts were greater in prison than in their own homes.'

The Board are of belief that the present prison system has been formed too exclusively with a view to reformation. 'A hardened criminal's mind,' they properly add, 'must be prepared for the influences which the chaplain and teacher may bring to bear upon it; and they consider that it would be beneficial to their future progress that their stubborn hearts should be broken down under 10 or 15 days' close confinement on stinted diet, without work or instruction, before the present system is brought into operation, when they can conceive no treatment more likely to promote a wholesome reformation than kind, religious, and temporal instruction and advice, accompanied by moderate labour in separate confinement, with separate out-of-door exercise. Any treatment with the view of reformation for short-sentenced prisoners without stringent penal accompaniments suited to the age of the convicts, the County Board consider to be worse than futile.

'In their experience many of the long-sentenced prisoners have made wonderful progress in education, and not a few have been taught to read and write tolerably who were in perfect ignorance on their admission. Many also have made professions of repentance, and expressed resolutions of amendment during their confinement; but they know of few who have evidenced the reality of their reformation by a sustained course of good conduct.

'The County Board approve of the present separate system, as likely to lead to reformation in the case of long-sentenced prisoners, provided it were fully carried into operation after a period of more penal regulations after their first short conviction.'

In concluding, the Board observe that, on the whole, their experience has led to the conviction that the present system of prison discipline has proved ineffectual in the objects of prevention, punishment, and reformation; and the remedies which they venture to propose are, a more severely penal system in the case of all short sentences; flagellation exclusively for the petty offences, and flagellation, with imprisonment, for the graver offences of juveniles; and that, in cases of long

sentences, the separate system should be fully enforced.'

Every Prison Board of management could, we believe, tell the same tale, and point to the necessity for a less indulgent system of discipline.

A GUIDE THROUGH LONDON.

'THE limits of London, as defined by act of parliament, are the circumference of a circle, the radius of which is of the length of three miles from the General Post-Office. This would make London about twenty miles in circumference; it is generally said to be about thirty.* This thirty miles of ground, which geologists call the London Basin, is, as everybody knows, crammed with habitations as closely as they can pack. These are arranged—if such a word can be applied 'to a world without a plan'—in streets, alleys, squares, lanes, crescents, &c. in so dense a confusion, that a map of London strikes the stranger as an inexplicable puzzle which no ingenuity can unravel. Most of the streets take such heterogeneous directions, that he often travels east when he thinks he is going west, and finds himself in one of the four counties on which London stands, when he is perhaps in another, two counties off. The Thames, instead of affording him a clue out of the maze, confounds him. 'I began to study the map of London,' says Southey (*Esperella's Letters*), 'though dismayed at the sight of its prodigious extent. The river is no assistance to a stranger in finding his way. There is no street along its banks, and no eminence from whence you can look around and take your bearings.'

There is therefore no place in the world for which a guide is so thoroughly requisite as the Great Metropolis, and it is remarkable that till now such an auxiliary has not existed—at least such a one as gives a comprehensive as well as detailed view of the vast subject. Perhaps no man—till the courageous Mr Cunningham, whose volumes are now before us—has had the nerve to deal with the million of facts London presents; or whoever has, may have been crushed under the mountain of labour it entailed. We heartily congratulate the present author, not only on having survived his task, but on having performed it thoroughly and well.

It is quite clear that Mr Cunningham gave up as hopeless and impossible the notion of guiding his reader through the streets of London. All, however, he could do for the bewildered stranger he has done. He says to him in effect—'Find your way into any locality, street, or public edifice you are interested in or want to know about, and I will tell you everything worth knowing concerning it.' His 'Handbook' is therefore arranged alphabetically. 'The dictionary form, though not a novelty in books about London,' he says in his preface, 'is, I am confident, the very best form the work could have taken. The visitor who finds himself in a certain street, or near a certain building, and wishes to read on the spot whatever is known about them, has, where the alphabetical plan is followed out, only one reference to make—he goes direct to the article itself.'

As a specimen of Mr Cunningham's knowledge of his subject, of his research, of the quantity of knowledge afforded in a small space, and of the collateral information to be instantly got at by cross references, let us take an article at random. You are in Fleet Street—the chief scene in Sir Walter Scott's 'Fortunes of Nigel'—and you turn up the entry in the 'Handbook.'

'FLEET STREET.—A line of street with shops and houses on either side between Temple Bar and Ludgate Hill, one of the largest thoroughfares in London, and one of the most famous, deriving its name from a streamlet called the Fleet, obscure in itself, but widely known from the Ditch, the Prison, and the street to

* A Handbook for London Past and Present. By Peter Cunningham. In two volumes. London: John Murray.

which it has lent its name. There are two churches in the street—*St Dunstan's-in-the-West* and *St Bride's*. The following places of interest are described under their respective titles:—*South or Thames Side*—Middle Temple Gate; Inner Temple Gate; Falcon Court; Mitre Court; Ram Alley, now Hare Place; Sergeants' Inn; Water Lane; Whitefriars; Salisbury Court. *North Side*—Shoe Lane; Peterborough Court; Bolt Court; Johnson's Court; Crane Court; Fetter Lane; Chancery Lane; Apollo Court; Bell Yard; Shire Lane. The Fire of London stopped at the church of *St Dunstan's-in-the-West* on the one side, and within a few houses of the Inner Temple Gate on the other. Fleet Street has been famous for its waxwork and moving exhibitions since Queen Elizabeth's time, "probably," says Gifford, "from its being the great thoroughfare of the City." It has only recently lost its character for waxwork exhibitions.

"*Sogliardo*. They say there's a new motion of the city of Nineveh, with Jonas and the whale, to be seen at Fleet Bridge. You can tell, cousin?"

Fungoso. Yes, I think there be such a thing: I saw the picture.
Ben Jonson, Every Man out of his Humour."

"And now at length he's brought
Unto fair London city,
Where, in Fleet Street,
All those may see't
That will not believe my ditty."—*Butler*.

"I design to expose it to the public view at my secretary, Mr Lillie's, who shall have an explication of all the terms of art; and I doubt not but it will give as good content as the Moving Picture in Fleet Street."—*The Tatler*, No. 129.

Mrs Salmon's celebrated waxwork exhibition (a permanent exhibition like Madame Tussaud's) was shown "near the Horn Tavern in Fleet Street." The house was distinguished by the sign of the Salmon, and has been engraved by J. T. Smith.

"It would have been ridiculous for the ingenious Mrs Salmon to have lived at the sign of the Trout; for which reason she has erected before her house the figure of a fish that is her namesake."—*The Spectator*, No. 28.

"The tent of Darius is to be peopled by the ingenious Mrs Salmon, where Alexander is to fall in love with a piece of wax-work, that represents the beautiful Statira."—*The Spectator*, No. 31.

Eminent Inhabitants.—Sir Symond D'Ewes.

"Sir Henry Spelman, an aged and learned antiquary, came to visit me at my lodgings near the Inner Temple Gate in Fleet Street, where I had lain since my coming to town, who dining with me, we spent a great part of the day in solid and fruitful discourse."—*D'Ewes's Journal*, vol. ii. p. 97.

Michael Drayton, the poet,

"lived at the bay-windowed house, next the east end of *St Dunstan's* ch: in Fleet Street."—*Aubrey's Lives*, ii. 335.

Cowley, the poet.

"He was born in Fleet Street, London, near Chancery Lane. His father was a grocer, at the signe of . . ."—*Aubrey's Lives*, ii. 295.

Praise-God-Barebones. He was a leather-seller in Fleet Street, and owner of a house called "The Lock and Key," in the parish of *St Dunstan-in-the-West*, let to a family of the name of Speight, in whose occupation it was when it was consumed in the Great Fire of London. It was rebuilt by Barebones.*—T. Snelling, known by his works on coins. One now before me has this imprint, "London: printed for T. Snelling, next the Horn Tavern in Fleet Street, 1766, who buys and sells all sorts of coins and medals." The Horn Tavern is now "Anderton's Hotel," No. 164 Fleet Street. *Eminent Printers, Stationers, and Booksellers*.—Wynkyn de Worde, "at the signe of the Sonne." Richard Pynson, "emprentyd by me Rycharde Pynson, at the temple barre of London, 1493." Rastell, "at the signe of the Star." Richard Tottel, "within Temple Bar, at the signe of the Hande and Starre;" now the shop and property of Mr Butterworth, the law bookseller, who possesses the original leases from the earliest grant in the reign of Henry VIII. down to the period of his own purchase.

* Addit. MS. 5070, in Brit. Mus.

John Jaggard, in the reign of James I., and Joel Stephens, in the reign of George I., were law stationers in Fleet Street, using Tottel's old sign of the Hand and Star. W. Copeland, "at the signe of the Rose Garland." Bernard Lintot, at "the Cross Keys," "between the Temple-gates," and next door to *Nando's*. Edmund Curl, "at the Dial and Bible against *St Dunstan's Church*." Lawton Gilliver, "at Homer's Head against *St Dunstan's Church*." Jacob Robinson, "on the west side of the gateway leading down the Inner Temple Lane;" now Groom the confectioner's.

"The friendship of Pope and Warburton had its commencement in that bookseller's shop which is situate on the wayside of the gateway leading down the Inner Temple Lane. Warburton had some dealings with Jacob Robinson the publisher, to whom the shop belonged, and may be supposed to have been drawn there on business; Pope might have a call of the like kind: however that may be, there they met, and entering into a conversation which was not soon ended, conceived a mutual liking, and, as we may suppose, plighted their faith to each other. The fruit of this interview, and the subsequent communications of the parties, was the publication, in November 1739, of a pamphlet with this title—'A Vindication of Mr Pope's Essay on Man. By the Author of the Divine Legation of Moses. Printed for J. Robinson.'"—*Hawkins's Life of Johnson*, p. 69.

Arthur Collins, "at the Black Boy in Fleet Street;" here, in 1709, he published the first edition of his excellent *Peagear*. T. White, at No. 63. H. Lowndes, at No. 77. John Murray, at No. 32. [See Falcon Court.] *Eminent Bankers*.—Child's, at Temple Bar Within, the oldest existing banking-house in London; "Richard Blanchard and Francis Child, at the Marygold in Fleet Street," were goldsmiths with "running cashes" in the reign of Charles II. The old sign of the house, the Marygold, is still preserved. Alderman Backwell, who was ruined by the shutting up of the Exchequer in the reign of Charles II., was for some time a partner with Blanchard and Child; his accounts for the sale of Dunkirk to the French are among the records of the firm. The chief proprietor in the house is the present Countess of Jersey, wife of George Child Villiers, Earl of Jersey. "In the hands of Mr Blanchard, goldsmith, next door to Temple Bar," Dryden deposited his L.50 for the discovery of Lord Rochester's bullies, by whom he was barbarously assaulted and wounded in Rose Street, Covent Garden.—Hoare's; "James Hore, at the Golden Bottle in Cheapside," was a goldsmith, with a "running cash" in 1677; and Mr Richard Hoare, a goldsmith, "at the Golden Bottle in Fleet Street," in 1693. Among the debts of the great Lord Clarendon occurs, "To Mr Hore for plate, L.27, 10s. 3d."—Gosling's, at "The Three Squirrel's, over against *St Dunstan's*;" Major Pinckney, a goldsmith, lived, in 1673-4, at "The Three Squirrels, over against *St Dunstan's Church* in Fleet Street." *Celebrated Taverns and Coffee-Houses*.—The Devil Tavern; the King's Head Tavern, "at the corner of Chancery Lane;" the Bolt-in-Tun; the Horn Tavern; the Mitre; the Cock; the Rainbow; Dick's; *Nando's*; *Peele's*, at the corner of Fetter Lane (in existence as early as 1722). Chaucer is said to have beaten a Franciscan friar in Fleet Street, and to have been fined two shillings for the offence, by the Honourable Society of the Inner Temple; so Speight had heard from Master Barkly, who had seen the entry in the records of the Inner Temple.

Here all that the inquirer wishes to know about this celebrated thoroughfare is compressed into three pages. Mr Cunningham doubtless had not room for Boswell's and Dr Johnson's opinion of the charms of Fleet Street, as reported by the former:—"We walked in the evening in Greenwich Park. He (Johnson) asked me, I suppose by way of trying my disposition, 'Is not this very fine?' Having no exquisite relish for the beauties of nature, and being more delighted with the busy hum of men, I answered, 'Yes, sir; but not equal to Fleet Street.'" Johnson: "You are right, sir."

Fleet Street naturally recalls to the reader's recollection its neighbouring *Alsatia*; and with the burst of Jeremy, in Congreve's 'Love for Love,' on his lips, 'Please your honour, liberty and Fleet Street for ever!'

he will naturally turn to Mr Cunningham's amusing account of that precinct, the unbridled liberties of which were anciently not altogether bounded by its northern limit, Fleet Street.

The dictionary, which of course occupies the bulk of the book, is preceded by concise general information respecting London, and directions as to what 'the painter and connoisseur should see,' and what the architect, the sculptor, and the archæologist should see. There are also lists of the celebrated palaces near to, and the palaces and chief houses of the nobility in, London. The author also informs the weary pedestrian where he can best recruit exhausted nature during his peregrinations. He points out where he can best dine, where a draught of the best London porter is to be had, and where the best cup of coffee; where he can best lodge, and how he can best get from one end of the brick-and-mortar wilderness in omnibuses and cabs to another; and to show how necessary this last sort of information is, he gives the length of some of the streets. We find that the New Road is 5115 yards, and its continuation, the City Road, 1690 yards more; so that this single thoroughfare is nearly 4 miles long. Oxford Street is 2304 yards, Regent Street 1730 yards (or within 30 paces of a mile), and the Strand 1369 yards long.

The 'Handbook' is not only a guide to the surface, but takes the reader into the lower regions of London—its sub-ways. The amount of sewerage within the city of London—that small centre which does not occupy above an eighth of the space on which the metropolis stands, but which, notwithstanding, includes fifty miles of streets—goes under $47\frac{3}{4}$ miles of them. The tunnelling for the purpose of drawing off refuse under the rest of the town must be prodigious, for the ordinary daily amount of London sewerage discharged into the river Thames, on the north or Middlesex side, has been calculated at 7,045,120; and on the south side, 2,457,600 cubic feet, making a total of 9,502,720 cubic feet—a quantity equivalent to a surface of more than 36 acres in extent, and 6 feet in depth. In other words, this vast body of *bane* is allowed to poison the water of the Thames and the air of London, and by consequence the health of the people, when, by judicious management, it might be converted into a blessing; for it is the finest possible manure, and, if properly dealt with, could be made to fertilise the land for hundreds of miles round London. We perceive that the 'Gardeners' Chronicle'—a first authority on this subject—promises half-a-dozen crops per annum on grass land by the use of London sewerage as manure; and Mr Chadwick shows its economy by stating, from actual experiment, that the cost of labour in applying it to the land is no more than 1s. 8d. per acre, while the ordinary cost of a less efficient top-dressing in present use is from 13s. to 14s. per acre. A company has already obtained full legislative powers for diverting the fetid but most valuable refuse into the agricultural districts by means of underground pipes and steam-forcing agency. Thus London will soon become a vast centre of sewerage—and there is great room for the extension of the centre; for a vast portion of the metropolis itself is still without the means of drawing off refuse. It will scarcely be believed that it is only within a year or two that Buckingham Palace, the residence of her Majesty, had the advantage of sewers; and Mr Cunningham states that the parish of St James's, with 168 streets and alleys, has fifty-eight of them totally without sewers. If the court parish be in this condition, what must be the state of those wretched sinks of filth and disease Rotherhithe, Bethnal Green, Jacob's Island, &c.?

There are several hundred miles of water-pipes hidden in the soil of London. These are said to supply 35,000,000 gallons of that fluid to the inhabitants per diem; yet of the 270,000 houses in London, 70,000 have no water supplied to them whatever. The London public are the victims of seven Water-Companies, whose charges are so exorbitant, and their profits so inordinate, that a hundred-pound share in the New River

Company was sold a short time since for £17,000! Yet the water supplied from the sewer-polluted Thames is, despite filtration, so bad, that Mr Cunningham advises his readers by no means to drink it, but to draw on the public pumps, which happily abound.

We have referred to these points because, as they do not lie on the surface, they are less heeded by strangers than more prominent subjects. In relation to the demands of sight-seers, the 'Handbook' will speak most efficaciously for itself; hence we do not allude to the 'show-places' so elaborately described in it. The extraordinary research displayed by the author gives his work a literary charm which is a novelty in a dictionary. It can be read with pleasure, page after page, because of the countless extracts from the works of the best authors illustrative of various localities. Mr Cunningham states in his preface that he has been seven years engaged on this useful undertaking.

STORY OF NORMAN M'LEOD.

I AM the son of a veteran named Daniel M'Leod, who entered the army when he was a mere boy. By good behaviour, he was raised to the rank of lance-corporal in the 72d foot. When the regiment was passing through Darlington, my mother, at that time a young servant-maid, became attached to my father, and shortly afterwards was united to him in wedlock. After sojourning a short time in the south of England, the regiment was shipped on board a transport, and conveyed to Graham's Town, Cape of Good Hope, where they were placed on garrison duty, their only relief from such monotonous employment being in occasionally repelling the attacks of the Caffres. My earliest recollections are of camps, soldiers, red coats, waving plumes, and gaudy military displays; and even yet I have a dim remembrance of calls to arms, of the groans of the wounded, of the ghastly dead, and the wailings of the bereaved; for I was old enough before I left Graham's Town to get such spectacles stamped on my memory.

I had no choice in a profession: I was born a soldier, if I may use such an expression. When a mere boy, I was placed under the charge of the bandmaster, and in a short time became quite a proficient player on the fife. I am still fond of the instrument, though it has frequently led me into trouble. For a number of years I continued doing my duty to the entire satisfaction of my superiors, and altogether I felt pretty comfortable. I had received a passable education in the regimental schools, and as I was fond of reading, I got plenty of books out of the barracks' library. These books consisted chiefly of tales of adventure by 'flood and field,' or such as threw a kind of chivalrous romance round the profession of arms, and fired the imagination with military ardour. When our period of foreign service had expired, we were ordered to embark for England, as we were to be relieved by the 9th regiment of infantry. The vessel which brought us to the shores of Old England was a clumsy old hulk called the 'Ganges;' and instead of sailing, she literally rolled over the billows until she arrived at Portsmouth. Before leaving the Cape I had married a young girl named M'Kenzie, whose father originally belonged to Inverness. He, like many other country lads, had enlisted in a frolic during a 'fair' time in his native town; and afterwards married a Highland servant, whom he became acquainted with in Glasgow. She bore him two sons and one daughter. One of the sons is now in a good line of business in New York, the other is an agent for a West India house, and resides in Liverpool.

In the midst of our rejoicings after reaching England, I was seized with dysentery, and placed in the hospital, where in a short time I was reduced to skin and bone. When getting better, I learned one day that a number of our men, who had been long abroad, and who were advanced in years, were to get their discharge, amongst whom were my father and father-in-law. This was a

severe shock to me, and the parting with them was the greatest trial I had as yet experienced. My father, before leaving, gave me some good soldierly advice, and faintly encouraged a hope that he would 'buy me off.' He went to Perth, where, by dint of telling wonderful stories and selling good whisky, he manages to drive a brisk business as a vintner. My wife's parents took an affectionate leave of us, and many were the 'salt tears' all of us shed. They retired to their native town, Inverness, where they live in comparative comfort; but from some unknown cause, they have never, since the day they left the regiment, recognised me.

After we had been about two years in England, we were sent to Edinburgh Castle, and here an accident occurred that changed the whole current of my after-life. One warm day in the month of June, our band-master, with whom I was a great favourite, went to the Forth to bathe, and when at a considerable distance from shore, he was seized with the cramp, and was drowned. The death of this man snapped the cord that bound me to military life; I never enjoyed a day's happiness in the army after I lost him. An ignorant person, who disliked me, was promoted to his situation; and after he was made my master, he delighted in tormenting me. To such a length did he carry his vexatious annoyances, that they became unbearable. There is no redress for such sufferings. On review day, the general asks if the men have any complaints against their officers; but this is a mere farce—no complaints could be made with safety, or the after-consequences would be indeed galling and bitter. From the circumstance mentioned, and other causes, I took an insuperable dislike to the military profession; and without calculating the cost, I decided on deserting.

When I had formed that resolution, I kept as much aloof from my former companions as possible: the thought of what I was to do made me melancholy, and my comrades tormented me with questions; and advised me, if I was ill, to go to the hospital. My wife, who was an affectionate creature, was unceasing in her efforts to cheer my drooping spirits. She saw I was unhappy, and longed to impart a healing balm to my soul. She was indeed a sweet, lovely creature. Well, one day I announced to her my resolution to desert; and although she burst into tears with the surprise and terror, she made no opposition. With a few shillings which I had saved, I purchased a suit of old moleskins from a broker in St Mary's Wynd, and told my wife to stop for two days after I had gone, as this would lull suspicion. On the 1st September 18—, all my plans being completed, I decamped. I bivouacked for the first night in the woods adjoining Craigmillar Castle, a few miles south from Edinburgh. I here took off my regimentals, and hid them in the branches of a dark, thick-set Scotch fir-tree, where they possibly are to this day. On the following morning I set out, by way of Alloa, Dollar, and Milnathort, for Perth, which I had appointed as the meeting-place of myself and wife.

On arriving in Perth, I went straight to my father's, and asked for refuge until I had arranged plans for my future guidance; but he would not listen to me, and ordered me out of his house, as the harbouring of a deserter would cause him to lose his pension. I was stunned by this unexpected blow: I slowly withdrew; and after I reached the door, I burst into tears. I stood on the opposite side of the street nearly two hours watching the expected arrival of my wife. When she did arrive, the news of my father's reception completely unnerved her, and I was obliged to carry her in my arms to a small public-house in the Watergate, where we got refreshments and lodgings. We settled that, on the following morning, we would proceed to Aberdeen, from whence she would go on to Inverness to her father's.

After much toil and trouble we reached Aberdeen, where we separated, not without mutual anguish and loving protestations. I obtained employment at Devanah Brewery, where I continued for three months in comparative comfort, if I except the slavish fear and jealousy

that always hovered o'er my mind. It was certainly wrong in the first place to desert; for it was a base breach of promise to be faithful to my duty. But it was not less foolish for me to think of escaping detection and capture. Till this day, I am unable to explain my conduct in this respect, unless by a candid allowance for stupidity. Detection, as a matter of course, came. One day I was wheeling a barrow along Union Street, when I was suddenly arrested by two policemen, and thrown into jail as a deserter. On the following morning I was marched off to Perth between two soldiers, fully armed, who had the usual instructions in such cases. Nothing occurred worth mentioning until we arrived at Cupar-Angus, where the people appeared to sympathise with me in my unfortunate condition. We entered a public-house there to get dinner, and were ushered into a large room in the second floor. The servant who attended us upbraided the men for not removing my handcuffs, and ultimately they yielded to her solicitations. We began dinner, and silently despatched a plate of broth each. While one of my guards was filling the plates a second time, I seized the basin of warm soup, and dashed it in his face. In a moment I felled the other to the ground with the wooden ladle; and before they could recover, I was on the street.

I ran in as zig-zag a direction as possible. On reaching the outskirts of the town, I held right east for about a mile, when I came to a wall of great height, which apparently enclosed a gentleman's garden. As I was anxious to see about me, by the assistance of a young tree which was close to the wall, I climbed to the top of it, and stood up to look for my pursuers: in a moment I lost my balance, fell to the ground, and became insensible. When I awoke to consciousness, I found myself stretched on a sofa, and an old lady bathing my temples with cold water. I told her the whole truth; and when I spoke of my poor wife, she feelingly pitied me, and the tears ran down her cheeks. I was invited to stay all night, and next morning she presented me with five shillings and a packet of bread and cheese, and wished me God-speed. I left her with a heavy heart, and made my way to Errol, a small town in the Carse of Gowrie, and situated close to the banks of the Tay. On arriving there, I felt completely prostrated in mind and body. I entered a small shop, and purchased a penny roll, which I ate, seasoning it only with a drink of water. When evening came, I tried to find lodgings, but failed; and I entered a farmer's shed close by the town, and slept amongst the straw.

Next morning I crossed the Tay to Newburgh, from thence I proceeded to Dunfermline, where I got work at a bleachfield in the neighbourhood of the town. Feeling myself pretty secure here, I sent to Inverness for my wife, and on her arrival, we took up house in Dunfermline. Here I suffered severely from the effects of my fall in the garden at Cupar; and for a long time I was very unhappy in my mind. I started at every knock, and my sleep was disturbed by visions of handcuffs, jails, and halberds.

I had continued here fully two years, and amongst the young men of the work I had organized a musical 'band,' and devoted all my leisure hours to instructing them; and by my diligence and knowledge of music, made the 'Dunfermline Band' famous in Fife-shire. One day I was busy at work preparing liquor, when two soldiers entered, and asked me where they could find Norman McLeod. I politely informed them I had not been long about the work, but directed them to the manager's house, that was some distance off, and I had no doubt he could tell them where they would find Norman. They had no sooner turned their backs than I hastened into town, changed my dress, put a few shillings in my pocket, tore myself from my wife, and fled, never stopping till I reached Dundee. I wrote to my wife, requesting her to sell our furniture, and proceed to Liverpool to her brother's, where I would join her; as from thence, by his assistance, we might get out to America. She did as I directed, and I never

saw her more. Worn out with constant terror, anguish, and fatigue, she was seized with fever when passing through Carlisle, and died; and before the people connected with the infirmary could find me out, she was buried. How bitterly I felt this bereavement I need not tell. Indeed my grief, added to the pain I was suffering from the effects of my fall at Cupar-Angus, for a moment allowed thoughts of suicide to enter my mind; but my better nature prevailed.

For eight months did I live unmolested at Cherryfield, Dundee; when one night a few friends, who were fond of music, invited me to a small party in a tavern close to the Magdalen Yard—the place where George Kinloch held the reform meeting that was the cause of his flight from Scotland. On going home to my lodgings, I played all the way on my favourite instrument, the fife, when suddenly I was arrested on the Perth Road as a deserter. My comrades, who were entirely ignorant of my former profession, were astonished, and protested that the policemen were mistaken. I was thrown into the police cells, and next morning was marched off to Glasgow, where my regiment was lying. The sudden shock I thus sustained increased the danger of the malady I was and am suffering from; and my trial was delayed, as the surgeons decided I was in a dangerous condition. While confined in the hospital a letter reached me, announcing the death of an uncle, who was a farmer in the vicinity of Arbroath. He was a bachelor, and bequeathed the sum of £500 to my unfortunate self. Through the medium of one of our surgeons, who was a very feeling-hearted man, I proposed to purchase my discharge; and as his representations were unfavourable to my ultimate recovery, it was granted, and I returned to Dundee to spend the remainder of my days. How thankful I was to escape from the vulgar oppressions of sergeants and bandmasters. No man, I think, can fully know the value of liberty till he has gone through the slavery of soldiering.

Broken in constitution, I feel that my days are not to be long on the earth; but I hope, while I live, that I may be able, by frugality and temperance, to keep myself upon the legacy so providentially left me. But oh, that life of a deserter—that reign of terror and torture! I still start and tremble at the sight of a soldier; and the idea of that profession, which kept me so long in bodily and mental anguish, and murdered my only friend and love, my sweet and gentle wife, makes my blood run cold.

[The above autobiography, we are told, is literally true, and we give it as a curiosity. Norman McLeod is now at rest: the weary, solitary man sleeps soundly in the old graveyard of 'bonnie Dundee.']

THE FEMALE DOCTOR OF PHILOSOPHY.

FROM THE ITALIAN.

LAURA MARIA CATHARINE BASSI was born 29th October 1711. Her parents and friends, remarking in her, from the earliest age, a most ardent desire to learn, and a gravity much beyond her years, believed that by cultivating her mind by study they might develop some remarkable powers. Her rapid progress amply justified the hopes they had conceived. While she was yet very young, she easily acquired a knowledge of the Latin writers, so as to be able to appreciate their beauties. This proved of great advantage to her; for to write Italian with elegance and purity a most careful study of the Latin language is indispensable. In this way the value of the words which have in such large numbers been transplanted from it is estimated, and the majesty of the Latin tongue is imitated within the limits dictated by sound judgment. But as the loftiest genius is, by its very nature, bent upon the search for truth, which alone furnishes repose to the soul, Laura gave herself up to the study of philosophy, and therein discovered such charms, that to the end of her days it remained her favourite pursuit. The study of

the laws of the universe, the observation of natural phenomena, everything which related to general and experimental physics, were for Laura the objects of indefatigable application. It would be difficult to paint the delight with which her friends and instructors observed so much wisdom in one yet in the budding of her youth, and how ardently they desired that her merits should be crowned by public approbation. They conjured her to overcome her sex's bashfulness, alleging that, since she was endowed by superior genius, and the cultivation of her powers had obtained for her so distinguished a position, it became her to demonstrate, in a public disputation on philosophy, that women have a right as well as men to penetrate into the mysteries of knowledge. But Laura, whose natural disposition led her, above all things, to delight in a quiet and retired life, and who also feared she might be accused of pride by acting in a manner so contrary to the usages of her sex, replied, 'I have devoted myself to study in order to find incentives to good actions and models to follow. I know that glory is a vain and fugitive thing, frequently denied to him who is most arduous in its pursuit. I never felt any ambition to become illustrious in the eyes of the world, and am nowise solicitous to furnish arms to envy, which is always ready to tear to pieces even the most worthy. Leave me to continue, unknown to the public, my delightful studies; and greatly will they profit me, if I can by their aid procure some gratification for my relatives, and deserve the esteem of the worthy.' The will and prayers of her relatives at last triumphed over her modesty. On the 17th April 1732 she furnished a brilliant proof of her acquirements, by replying to five of the most celebrated professors of the university of Bologna, who interrogated her on the most important philosophical subjects before a large assemblage of the principal personages of the city. The audience were at a loss which most to admire, her elegant enunciation of the most profound doctrines, or the modest reserve of her demeanour; and as a mark of the esteem and admiration she inspired, by the consent of all present it was determined to invest her solemnly with the degree of doctor of philosophy. The 12th May, when this prize of wisdom was conferred on Laura, was indeed a day of triumphant rejoicing for her friends. Accompanied by ladies of the highest nobility, Laura presented herself before the authorities of the university assembled to receive her, and having assumed the doctor's robe and a silver crown, thanked, with tears in her eyes, those to whose good opinion she felt herself indebted for so remarkable an honour. For several days the entire population celebrated with festivities an event which they regarded as adding to the glory of their town.

The favours which Laura had so deservedly received at the hands of the public were continued to her undiminished as long as she lived. Persons of note arriving at Bologna from foreign countries were at once conducted to her as being the person who could most advantageously represent Italian genius; men rendered eminent by their acquirements or dignities felt honoured by her friendship; and foreigners, who were so sparing in their praises of her contemporaries, lauded her to the skies. All this failed to diminish the simplicity of her manners; her actions and language continued as gentle and benevolent as ever, and she always appeared anxious rather to conceal than exhibit her rare qualifications. Scarcely had she attained her twenty-first year, when the senate confided a professor's chair to her in the university; and her activity, her judgment and quickness, the luminous order in which she expounded the most difficult theories, and the gracefulness of her demeanour, placed her on a level with the most distinguished in the art of teaching. Students flocked from distant countries to hear her, and on their return, celebrated her wisdom and excellence. The church of Rome was at that period governed by Benedict XIV., a pontiff who proved to the world that the sanctity of religion

may be cherished and venerated in the highest degree by one animated by the love of wisdom. In an academy founded by him at Bologna, and named after him the Benedictine, Laura held an appointment, and exacted the usual admiration of her auditors whenever she addressed them. She formed a valuable collection of philosophical instruments, and took great pleasure in making experiments, and in observing natural phenomena.

Those engaged in the pursuit of truth regard the cultivation of literature as an agreeable relaxation; and Laura considered such studies as not only useful, but necessary; and doubtless, had she been a stranger to them, she never could have expounded her theories so eloquently; for it is in vain that we may be endowed with a lofty and fertile understanding if we are ignorant of the art which teaches the expression of the thoughts with grace and dignity, and enables us to render the approaches to science both easy and agreeable. This art can never be acquired if the divine productions of poets and orators are neglected.

In the letters which Laura wrote to her friends, or to the most celebrated personages of her times, we clearly discern the care she took to attain a purity of style, and the great skill with which she expressed her noble thoughts. She made some attempts in poetry, and acquired enough of the Greek language to earn the praises of the erudite. Two treatises which she wrote on the laws of hydraulics and mechanical powers, and which are found in the 'Memoirs of the Institute of Bologna,' exhibit sufficiently her scientific acquirements; and it is to be regretted that she did not publish more of the results of her prolonged studies. From this she was in part deterred by that modesty which continued so remarkable in her, and in part by the cares of her family. Having married Dr Veratti, she fulfilled admirably all the duties of wife, mother, and mistress of a household. Her twelve sons were brought up and educated by herself; and it was indeed as honourable to her as the distinguished renown she had gained, that she never forgot the obligations upon her as a woman and the labours of her sex, and that she never trusted her young children to mercenary hands. To compass her various duties, she guarded, above all things, against indolence—that mortal enemy to every good habit and worthy occupation: she only allowed herself sufficient sleep to recruit her powers, and abstained from all frivolous amusements. The constant and respectful affection of her husband and children amply repaid her. Even in advanced life, though of infirm health, she never abandoned her habitual labours—regarding inactivity of body and mind but as an anticipated and prolonged death; and only a few hours before Bologna had to deplore the loss of one of its brightest ornaments, she took part in a long and learned discussion at the Benedictine Academy. She died 20th February 1778; and although somewhat advanced in years, every one felt that her career had been too short. The ladies of the city erected a monument to her memory.

INODOROUS TURPENTINE.

A most important chemical discovery has been recently made, by means of which oil of turpentine can be freed from its peculiar smell so completely, that not only is it inodorous, but it can be impregnated with any desired perfume, without at all deteriorating from its useful properties. The eminent chemist, Dr Serny, who has analysed the sweet oil of turpentine, states that while all the useful properties of oil of turpentine are preserved intact, all deleterious qualities are completely obliterated. The doctor also states that paint, when mixed with sweet oil of turpentine, is free from smell, and does not emit those noxious vapours which are so prejudicial to health: and that, in short, the use of sweet oil of turpentine is a certain preventive of painter's colic, and by its use house-painting becomes a perfectly inodorous process.—*Newspaper paragraph.*

EYE-DRINK.

BY CALDER CAMPBELL.

With spirit-thirst I wander forth
From towns, with right good-will;
And marvel if on all the earth,
Down dell and over hill,
A brother-spirit pines like mine
For want of rock and rill.

Week after week, month after month,
'Mid crowded streets to live,
Imparts that fever to the blood
Which fatal vapours give;
And life ebbs from us, in a flood,
Like water from a sieve.

The ocean and its margins, then,
They are a pleasant sight;
And heated, from the haunts of men,
The eyes upon them light—
Like birds sun-parched and weary, when
They rest near waters bright!

The fields, all green with grass, all red
And yellow with wild flowers—
The hedges, whence comes fragrance, shed
By blossoms from bird-bowers—
The gardens, near trim cottage-homes,
Refreshed by short soft showers:

The lanes, old lanes near hamlets neat,
Lanes rich in leaf and bloom—
The avenues of elm, where feet
May saunter in cool gloom
When July is at mid-day heat,
As in some quiet room:

And, more than all, the shady woods
Where mossy banks abound;
And dingles, where the painted hoods
Of foxgloves still are found,
Though summer drought hath dried the buds
Of many a plant around:

Where here a glade, and there a glen,
And up and down them twain,
Quaint little brooks run out and in,
As if they tried to gain
The secret life of leafiness
By dint of questings vain!

Woods, where the dove is heard all day,
The nightingale all night;
Where Summer shines a goddess gay,
And Winter, clothed in white,
A cosie carl, with fagots gray
To make his fireside bright!

And mountains, brown with heath—and cliffs
That overtop the sea,
Covered by sea-gulls, ships, and skiffs,
That seem intent to be
Each on its separate track of life,
And each a mystery!

And purple moorlands—yellow tracts
Of golden furze and broom;
And rusby marsh, where music harsh
Swell in the bittern's boom;
And ancient cairn, near wayside barn,
Where gipsy tents find room!

All these make Eye-drink; and the thirst
Of spirits worn and hot,
Assuaged by the delicious burst
Of waters, that flow not
From source impure, here finds a cure
That sweetens nature's lot.

But though I prize the forest best
Which quiet shelter gives,
And wonder how from sun and bough
Such bliss the soul receives,
I love it not for all its wood,
But for its wealth of leaves.

The path of life seems only green
When we ascend the hill;
But though gray shades are on it seen,
Its downward course to fill,
In nature we may sometimes see
A pleasant prospect still.

And so from crowded cities we
Do well, at times, to go;
And when athirst, all heavily
We feel our spirits grow,
'Tis wise to think such sweet Eye-drink
From country sights may flow!

PRICE 1½d.

CHANGE.

A LADY was accustomed to transport her family every summer to the country for change of air, and never without obtaining the desired benefit. The inhabitants of a certain village, however, were far from enjoying robust health themselves, and she expressed to the local doctor her surprise at the pale faces and languid looks she so frequently met in her peregrinations. 'The air here,' she said, 'is so exhilarating, that one would think there is no cause for the kind of exhaustion that seems to prevail among so many of the natives. Why should we derive more advantage from it than they, and carry back to our smoky town a health we do not find?' 'Alas, madam,' replied the doctor, 'if these poor people could return your visit, and spend every year a certain time in some smoky town, there would be fewer pale faces and languid looks in our village. The benefit you derive is not so much from the quality of the air, which you see clearly enough is not of the nature of a specific: it is from the *change of air*.' To many persons this doctrine will be a little puzzling; for it is more common than otherwise to attribute certain mystical qualities to the air of a particular locality. How are these qualities supposed to originate? Is there a different intermixture there of the gases forming the atmosphere? Or is the change produced by exhalations from the earth? In either case the air is not stationary. The village, which is of the earth earthy, has no fields of air it can call its own. The wind bloweth wheresoever it listeth; and the lady in her smoky town enjoys the reversion of that exhilarating fluid, which she found when in the country to have the power of reanimating the drooping health of her family.

The village doctor was right: it is in Change that the curative influence resides; and this fact is demonstrated by all the analogies of life and nature, whether drawn from the history of hours and seasons, of plants and animals, or of men and nations. The only thing constant in this world is change. The lives of human beings are a perpetual alternation of ease and labour, of slumber and waking, of hunger and repletion; and it is these conditions which preserve the balance of health. All are wholesome—all necessary. We must rest, or we cannot work; we must sleep, or our waking energy is lost; we must have an appetite, or we can derive no satisfaction from food. These are truisms; and a man would be laughed at who lectured upon the propriety of resting when one is tired, or eating when one is hungry. So much the better. We thus obtain a firm starting-point from which to proceed in a speculation on the general nature and necessity of change, as a preservative and curative principle.

Change must partake more or less of contrast; and thus the doctor's notion may be philosophically just,

that a villager would be likely to derive as much benefit from his visit to a town as the townsman would from his sojourn in a village. The latter would gain nothing by removing to another town, or the former to another village like his own, where both would find themselves under the same atmospherical and other conditions as usual. It would be useful to establish this fact, if it be one; for it would involve the banishment of sundry local superstitions, which we believe to be as irrational as those of ghosts and dreams. It would destroy the sanctity of many fashionable pilgrimages, and disenchant many sacred wells, hitherto supposed to be haunted in a special manner by the Spirit of Health. The temple of Hygeia would be thrown open to all who have 'the passion and the power to roam;' and we should no longer meet with the pitiable anomaly of crowds of health-seekers converging at some given spot, as if for the double purpose of enhancing the price and neutralising the benefit of change of air. Superstitions of the kind are common, even when they have no connection with fashion. A family derives advantage from their summer sojourn in a particular village, and straightway take it into their heads that this is owing to some mystical quality of the *air*. They return year after year to the same place; and even although the beneficial effect may diminish, they never suspect that this is owing to the scene having become so familiar as to deprive them to a certain extent of the sensation of change.

To establish the fact, however, would be of still higher importance to those who have fewer facilities of migration. If they knew that what they want is simply contrast: that the curative principle does not reside in a particular air, but in change of air; and not in change of air alone, but change of scene—in all things that originate new impressions, and divert the thoughts into new channels; and if they could be made to comprehend that an evening walk, or a holiday stroll, the sight of the green trees, the breath of the fields, the murmur of the river, the dash of the sea, the singing of uncaged birds, the lowing of cattle—any, in short, or all of the sights and sounds of nature, coming upon their wearied senses in contrast with the artificial things of their daily life—would ultimately purify and refresh both soul and body, we should have fewer pale faces and languid looks in our manufactories, and fewer diseased hearts brooding over necessary and manly labour, as if it were a curse instead of a blessing!

Change of employment has a similar refreshing effect to change of air: original authors, for instance, who cannot in the usual way remain long upon the wing with advantage, have been known to extend their hours of labour, by working in the same day upon two or more separate and wholly different compositions. Even during sleep, these individuals tell us, the mind is busy,

although we are unconscious of its operations; and its demand, therefore, is not for cessation, but merely change of occupation. The connection, however, is so close between the mind and body, that it would be unwise to carry this theory too far into practice. The body demands periodical rest, even to unconsciousness; and the mind, whose workings conduce in a still higher degree to the wear and tear of mortal life, must be treated not only with as much, but with greater tenderness. There is no doubt that in this instance of authorship, the intellectual power would depend upon the contrast in the two kinds of composition being sufficiently great to urge the mind into new trains of thought: but still, there is so much general similarity in literary brain-work, that conversation, music, or other social amusements, would be a far better alternation than mere change of labour.

Amusement, in fact, is change of air for the mind; but, in spite of the every-day experience of mankind, its necessity is not recognised by modern legislators. Among the ancients, and up to the close of the middle ages, it was a matter of grave consideration how to entertain the people; but in the present new Iron Age, we act upon the principle that amusement—except in the case of those who want it least—is mere waste of time. The sovereign patronises the Opera, and sets the good example to her well-bred subjects of dancing, and fête-making, and travelling for change of air; but her Majesty, we fear, has never been taught to consider that something analogous is still more necessary for the masses of the people. The efforts of parliament and of the moralists are directed, and very properly so, against such popular recreations as are inconsistent with the comparative refinement of the time. They give no quarter to boxing, bull-baiting, cock-fighting, and other barbarities; but while saving human and animal life, they have depressed the tone of the national mind, for they have provided no substitute for these sports of a ruder age—no change of air. Under the influence of their well-meant crusade against barbarism, the knife has now taken the place of the fist in the decision of vulgar quarrels; poison, the most dastardly, as well as the most atrocious of all weapons, has come in to the assistance of the knife; and the instances of crime given by our historian Hume, in proof of the barbarism of the epochs he describes, seem positive virtue when compared with the gigantic horrors of the passing day. This is the result of a disease, a moral typhus, occasioned simply by the want of change of air. The popular amusements we have referred to were brutal and abominable; but we are clearly of opinion that they were less hurtful than no amusement at all.

We may be told that in mechanics' institutions, lectures, and cheap reading-rooms, we have both the substitute and the contrast sought for: but this is a mistake. The province of these excellent novelties is to rival the taproom. Like it, they offer sedentary occupation, but of a totally different nature. They elevate the mind, and not merely the spirits, with an excitement which is followed by no reaction; and they inspire a sacred thirst which is more reviving, and yet more eager, after every draught. They are the natural combatants of low desires and mean indulgences, and transport the liberated soul from a poisonous to a wholesome atmosphere. But they are not, in the popular sense of the word, amusement, which can only contrast with work. The artisan can be expected neither to perform his duties nor enjoy his book without a frequent release from thought and care, such as his ruder ancestors sought in games of

blood. We ask too much of him, and give too little. We demand that he will lay aside his ancestral tastes, but never think of providing him with the means of gratifying the new ones we would substitute. We restrain him from unwholesome amusements, but take no care to provide him with others. We surround him with personal restrictions, and congratulate him on his intellectual emancipation. Read the commentary in this voice from the workshops of our country:—

'Air! air! We are sick with the breath of this iron civilisation: we are faint for want of air. Give us parks and promenades instead of enclosed fields, which we can only look at over the wall. Throw wide open to us your miscalled public gardens, and let us sit on the grass with our wives and children, and watch the flitting figures of the picture, and listen to the music till our souls comprehend it. Refinement! approximation of character! What refinement, what approximation can you expect from us with these iron rails between? You have taken from us our rudeness, and will you not give us something better in its stead? You have touched our imaginations, you have roused our longings, you have troubled our spirits with gleams and visions, and will you keep us panting and gasping here for ever? Give space to the limbs you have set free, and freedom to the souls you have made too big for their habitation. Air! air!' And these are not the humble longings the unreflecting imagine; for in the wholesome exhilaration of such amusements, contrasting with the monotony of daily toil, there resides an influence more powerful than that of all the moral lectures in the world. If our governors studied political philosophy as much as politics, they would know that to open places of harmless recreation to the people is to shut jails and work-houses. Nay, the very desire to enter the former argues an advance in refinement; there is something tranquillising even in the restlessness of this aspiration, like the murmuring motion of a stream; and though it be but a day-dream, yet doth it—in the words of Rare Old Ben—

'Yet doth it like an odour rise
On all the senses here,
And fall like sleep upon the eyes,
And music on the ear!'

But change in this respect being necessary for the moral health of the people, it is sure to come. History does not flow in England in the spasmodic gushes that make France a marvel. Change, whether social or political, is slow with us, but it is certain and effectual; and already we can see the dawn of a coming time when we shall all, now and then, set to play together like philosophers. The Scottish games in London, for instance, were a good omen; but independently of individual facts, there is on all sides a growing tone of good-humour. Even in those parts of the country where the Reformation confounded vice with gaiety, and recreation with irreligion, we can see the brow of orthodoxy begin to smooth its wrinkles. It is fully time for this, for we have now had leisure to separate things essentially distinct, though accidentally grouped together. We are weary of restrictions no longer necessary, and want change of air.

Is it not to the desire of change, intuitive in human bosoms, that we owe nearly everything that is great or good? Is it not this which has in all ages lighted the torch of discovery, and sent forth the pilgrims of science to the ends of the earth? Is it not this which has built up the civilisation of the present world into a form so peculiar? And is it not this principle in our being on

which the ministers of religion more especially rely, when exhorting us to press forward to the world to come? But the desire of change and contrast, like everything else, must be regulated by good sense; and, as usual, we must take for our guide the analogies of nature. More sleep than is required to repair our faculties, more food than suffices to allay our hunger, and more amusement than is necessary to unbend our minds after mental or bodily toil, are all equally injurious. One day of rest in the week (setting aside its religious character) is among the wisest of our social provisions; but more than one, even if permitted by economical considerations, would be a very questionable good. Amusements, in like manner, depend for much of their zest upon their periodicity; and as for the literal change of air with which we began, if our country sojourn be too much prolonged, it is no change at all.

But even while recognising the urgency of our aspirations after change, there is no occasion to mistake their other characteristics. If genuine, they will take advantage of circumstances, but not war against them. We have no right, before exhausting the indulgences at our command, to clamour for those beyond our reach. The artisan who does not enjoy sometimes an evening walk or a plunge in the river, who does not stop to look with tranquil pleasure upon the trees and fields, who does not listen with a glowing countenance to the natural music that floats upon the air, has no claim to be admitted to the resorts of the more refined. We have all access to a thousand humble and inexpensive pleasures, if we only choose to enjoy them. At this moment the town is going into the country; houses are shutting up on all hands, and dingy old women posting notices in the window that 'letters and parcels are to be left at No. 10.' Some families, who find inconvenient a further migration than to their back rooms, ashamed of remaining behind, have closed the shutters in front, to make-believe that they are in the country. And what becomes of us, whose pen betrays the ungenteel secret that we are at home? Why, a ramble now and then by the banks of Forth, a tour of the Calton Hill, a buffet with the breezes of Arthur's Seat, and a joke with some other last man in town—these are our change of air!

L. R.

THE INFANT KING.

THE day had not yet dawned on the 7th October 1715 when a little boy of about five years of age, who occupied one of the most splendid apartments in the palace of Versailles, started from his sleep, and sitting up in bed, fixed his eyes eagerly on a man who was seated in a large arm-chair by his side. The light of a bronze lamp which hung suspended from the ceiling showed him that his companion slept. He coughed two or three times, as if undecided whether or not to disturb his slumbers, but at length cried, 'Comtois—Comtois!' 'Sire?' replied Comtois, rousing himself hastily. 'Do pray look out, and tell me whether much snow has fallen in the night.'

Comtois approached the window, and lifting the curtain, quietly replied, 'Yes, sire, a great deal.' But the young king, who had followed with anxious eyes the movements of his valet, and had caught a glimpse through the window of the snow-covered landscape, exclaimed, 'How glad I am! Oh, take me up quick, Comtois! quick—quick: dress me—but do make haste, Comtois.'

'What can have put it into your majesty's head to wish to get up so early this morning?' replied Comtois, seating himself quietly in his arm-chair.

'You do not know, perhaps, that I have a great battle to fight this morning, Comtois; and I would lay a wager that the enemy is already under arms. I would not for anything he should be in the field before me.'

'The enemy is asleep, sire; and if you take my advice, you will follow his example.'

'Sleep! the day of a battle? Who ever heard of such a thing? But take me up, Comtois, I say,' continued the child, tossing himself impatiently in the bed.

'Calm yourself, sire; you must be more reasonable. Madame de Ventadour has forbidden me to allow you to get up so early.'

'And I, Louis XV., king of France, I command you to take me up!'

'Your majesty must please to understand'—

'I do not understand anything; I choose to get up,' said Louis more eagerly. 'The little Duke de Chartres sent me a challenge yesterday: he is the head of one party, I of another. I am sure, Comtois, you would not wish your king to appear either lazy or cowardly in the eyes of his subjects?'

'You may be quite easy, sire, on that head—the kings of your race have never been either cowardly or indolent.'

'Take me up, then, if you please, before the sun rises.'

'What, sire! has the sun also sent you a challenge?'

'No, no, good Comtois; but it would melt my arms.'

'What arms have you then chosen, sire, which melt before the sun?'

'Excellent ones, Comtois, I can assure you—good balls of snow. You need not laugh, Comtois: a ball of snow, well thrown, can give a famous blow I can tell you.'

'I have not the slightest doubt of it, sire,' replied Comtois, still laughing.

'You shall be present at the battle, Comtois, and you shall see what a grand affair it will be. Just fancy—we shall form two camps: the Duke de Chartres will command one, and I the other. I shall have all the best under my orders—the Duke d'Harcourt, the Count de Clermont, the Marquis de Nesle. Oh, I have not been able to sleep all night thinking of it, and I have so longed to get up! Now, like a good Comtois, do make haste—the sun will melt all our weapons; and I am sure that those who are to fight under my banners are waiting for me already on the field of battle. Oh, how unhappy kings are, that they cannot get anybody to obey them!'

A slight tap at the bedroom door interrupted Louis in the midst of his speech; Comtois opened the door, and was not a little surprised on seeing the Duke de Villeroy, the governor of the young king, entering the chamber at this early hour.

'Is the king awake yet?' inquired the marshal.

'He has been wanting to get up for this hour past, monseigneur,' replied the valet de chambre.

The Marshal de Villeroy approached the bed. 'Sire,' said he, 'the Duke of Orleans is this day to be appointed to the regency; it is necessary that you should make a short speech on the occasion. Do me the honour of listening to me, I beg of you; for you must learn this speech by heart, so as to be able to repeat it before the whole court.'

'Yes, sir, I will,' replied Louis, who was in reality a timid boy, and who did not venture to show his dissatisfaction at this delay.

'Listen to me attentively, then, sire: say after me, "*We declare*"'—

'Don't you think the sun, whenever it rises, will be sure to melt the snow?' interrupted Louis, whose attention was suddenly attracted by the glittering whiteness of the park, as its snowy vestment reflected the first beams of the rising sun. He had not heard a word of the commencement of his speech.

'Very possibly, sire,' replied Villeroy with an impatient gesture; 'but repeat after me now—" *We declare the Duke of Orleans*."

'*We declare the Duke of Orleans*,' said Louis; then, almost in the same breath he added, 'Comtois, just look whether the snow is still hard.'

'No matter whether it is or not, sire,' interrupted the marshal, who did not attempt to conceal his impatience at the inattention of his royal pupil. 'Now let us proceed, then—" *regent of this kingdom*."

'I daresay that the Duke de Chartres has a pile of snowballs as high as this ready by this time.'

'If you do not pay more attention, sire,' said Marshal de Villeroy in a tone of severity, 'you will never learn your speech.'

'But I should much rather play in the park with the other children,' replied Louis petulantly.

'You shall go there, sire, after the ceremony.'

'But the snow will be melted, sir, by that time.'

'Well, sire, then it *must* be melted.'

'But then I shall not be able to make snowballs.'

'Well, then, you must do without them, sire.'

'And my battle, and my warriors, and all the other children who will be amusing themselves, while I am here shut up in my room!'

'Kings, sire, are not like other children; they cannot be allowed to be always running about and amusing themselves.'

'Then if so, it is not at all an amusing thing to be a king, Marshal de Villeroy.'

'I must really insist, sire, upon your learning this speech: you ought to have known it an hour ago.'

'Well, I *will* listen now,' said Louis.

The marshal, somewhat softened by this promise of docility on the part of his pupil, seated himself by the bedside, and repeated, word by word, a very short speech, which his pupil recited after him with great exactness. He then retired, feeling fully assured that the young Louis was well prepared to perform his part in the approaching ceremony.

Louis bounded with joy when he saw the door close upon his governor. 'Now, then, for the park!' he exclaimed.

'Here is Madame de Ventadour, and your tutor Monsieur de Fleury,' said Comtois, as he ushered in these two new personages, followed by some domestics belonging to the palace, who carried a complete suit of clothes fitted for the royal child. When the divers articles which composed it were spread upon the table, the sight of so brilliant a costume helped to divert the mind of the young king for a moment from the fixed idea which had hitherto occupied his thoughts. But suddenly the idea seemed to strike him that this equipment was just the thing which would do to wear on the field of his intended battle.

'How beautiful it is—how very beautiful! Are you going to dress me in all these pretty things, dear mamma?' said he to his governess, of whom he was very fond, and whom he always called by the sweet name of mother.

'Certainly, my dear king,' she replied, as she began to perform his toilet. 'It is a pretty costume; is it not?'

'Oh how pleased my comrades will be to serve under my orders!' said Louis, as he examined separately each article.

First, there was a little jacket with falling sleeves of violet-coloured cloth (*violet* being the colour appropriated to royal mourning, and the little Louis having only lately lost his grandfather, Louis XIV.); then there was placed upon his head a cap of violet *crêpe*, lined with cloth of gold; and finally a blue ribbon was passed around his neck, to which hung suspended the Cross of the Order of St Louis, and that of the Order of the St Esprit. Up to this point everything went on as smoothly as possible; the child, absorbed in the contemplation of this rich and brilliant costume, was beginning to forget his morning vexations: he longed to be dressed, in order that he might escape from the hands of his governess; and he was just on the point of asking Comtois to hand him his miniature weapons, in order to be ready for the battle, when, to his great surprise, Madame de Ventadour handed him a pair of splendid leading-strings in cloth of gold.

'What are these for, mamma?' said he.

'They are leading-strings, sire,' she replied.

'And what are you going to do with them?'

'To put them on you, sire.'

'On me! leading-strings! You are joking, mamma?'

'They complete your costume, sire: they must be put on.'

'I cannot put them on, mamma: I really *will* not!'

'I am very sorry to be obliged to do anything which annoys you, my dear king; but it has been decided that, in order to mark your age, leading-strings should form a part of your costume.'

'But I do not choose to have them on, dear mamma. I do not want them, and I will not put them on!'

'But they cannot be dispensed with, sire.'

'Not dispense with leading-strings! Indeed I can, dear mamma. What is the use of putting them on me? Do you ever see me tumble when I am walking? How long is it since I have given myself a bruise on my forehead? You do not put leading-strings on me to run all day in the woods, to go up and down stairs, to skip over the trenches, and now you want to put them on me when I am only going to ride in a carriage, and then to sit in an arm-chair. Indeed, mamma, you are not reasonable: leading-strings are only put on *little* children.'

'Every one knows, sire, that *you* are not a little child; certainly one is no longer a child at five years and a-half; but still it cannot be helped—etiquette requires that on grand occasions you should wear leading-strings until your education is confined to the care of men.'

'Etiquette, custom! You say that every minute, dear mamma. The custom *ought* to be only to put leading-strings on little children who do not know how to walk. But if people are so anxious to use leading-strings, why not put them on all those old seigneurs we have here—on the Duke de Bourbon, who can hardly stand; or on the old Bishop de Troyes, who stumbles at every step; they, indeed, may be in want of them: but as for me, it is quite decided—I will not have them!'

'I intreat you, sire, to comply.'

'Do not talk to me any more about it, dear mamma. The sun is already risen; I have a battle to fight this morning, and my munition of war is not yet prepared; so pray do not keep me any longer.'

'Your leading-strings will not be the least in your way, sire. Pray put them on.'

'And how my companions would laugh at me, especially the Duke de Chartres!'

'They would not dare to do so, sire. Indeed it is not well done of you to require so much pressing about such a trifle. You ought to show yourself a little more ready to obey one whom you honour with the title of mother.'

'If the other children had them too, mamma, then I should not mind; but look at the Duke de Nangis, the little Marquis de Nesle, &c.: did you ever see them in leading-strings?'

'But they are not kings, sire, as you are.'

'And I am sure, then, it is very tiresome to be a king. How I have been teased ever since I got up this morning on account of my kingdom! My battle has been delayed; I have had a long speech to learn by heart; and now you want to put on these ugly leading-strings. But it is of no use talking to me: I will not do it!'

'Monsieur de Fleury,' said Madame de Ventadour to the king's tutor, who stood in the window reading his breviary, 'will you have the kindness to come here and make the king listen to reason?'

'Monsieur de Fleury,' said the child, 'as you are at the window, will you be so good as to tell me whether the snow is beginning to melt?'

'Not yet, sire,' replied M. de Fleury, approaching the fire, in front of which stood Madame de Ventadour with the leading-strings in her hand, whilst the young king kept his hands clasped behind him, to prevent her from taking him by surprise, and slipping them on.

'Why are you so obstinate, sire? Give me your hand, and let me see you do cheerfully, and for the sake of pleasing Madame de Ventadour, that which, sooner or later, *must* be done.'

'But I want to go to the park,' said the little Louis with a swelling heart, and tears starting to his eyes: 'I have snowballs to make.'

'You have, in the first place, *duties* to perform, sire; and *you*, sire, more than all other children: for, as a king, you ought to set *them* the example. Begin to do so at once by yielding to the wishes of your governess: raise your arm, sire, if you please: well; now, the other. There, now, it is done, sire, and I thank you for your obedience.'

'If kings are happy, it is not while they are children at all events,' said Louis XV., as he looked with tearful eyes on the gold belt of his leading-strings.

'You are right, sire,' said M. de Fleury. 'It is later: it is when they have learned to make their people happy.'

'The king's carriage is at the door,' said a gentleman-in-waiting, opening the folding-doors of the king's apartment. Madame de Ventadour rose, took the king by the hand, and led him down the grand staircase to the carriage, whilst M. de Fleury and the royal pages followed. The day was bitterly cold; but the poor little king rejoiced in the freezing blast, for he thought it would keep the snow from melting, and he could yet have his battle on his way back. With this hope he cheerfully entered the carriage, and waited with patience for M. de Villeroy and the Duke du Maine, who had both the right of entering the royal carriage. They reached the step at the same moment; and the foot of the one having accidentally touched that of the other, each measured his opponent with a disdainful glance.

'I beg to observe to the Marshal de Villeroy,' said the Duke du Maine, 'that, in the quality of prince of the blood, I have a right to the seat of honour in his majesty's carriage.'

'And I,' replied the marshal, without yielding a step, 'beg to observe to the Duke du Maine, that, as governor to the king, I have a right to the seat of honour, and am only bound to yield it to a legitimate prince of the blood, and not to M. le Duc du Maine.'

'We shall see that,' replied the duke, stepping into the carriage. The marshal, with a fiery glance, laid his hand on the intruder's arm. During this discussion the carriage door was necessarily kept open, and the young king was freezing with the cold. At length he exclaimed impatiently, 'For goodness' sake, gentlemen, come in, and both of you take the place of honour: I should just as soon sit with my back to the horses.'

'That is out of the question, sire,' replied the marshal.

'Well, then,' replied the young king, shivering with the cold, 'draw lots to see who shall sit by my side, or else both take your seats with your backs to the horses.' This last advice of the young king was at length followed, and the eight horses started at full gallop.

The carriage was no sooner in motion than the Marshal de Villeroy, bending forwards towards the young king, asked him if he remembered his speech; but at that moment they were passing the park of Vincennes, and his heart was too full to answer. He heard the joyous cries of his young companions, who were fighting the battle of which he had dreamt all the preceding night; he saw the hard, glittering snow, which would have made such glorious bombs; and then, when he began to think that before he was free again all the fun would be over, the tears started to his eyes.

'What are you thinking of, sire?' inquired the marshal. Louis made no reply, but pointed to the battlefield, and his large black eyes looked so full of sorrow, that it touched the heart of the marshal.

'What can we do, sire?' he observed, as M. de Fleury had already done. 'The children of kings are not like other children: they have duties to fulfil; and as it is their business to set an example to their people, *no* duty must be left undone.'

By this time they had reached the Faubourg St Antoine, and the people, both in the windows and the streets, were assembled to look at their king. A thousand acclamations welcomed him on every side, but the poor little fellow was sad and pale—he still thought of his

lost battle. They at length reached the palace of the Tuileries, and the young monarch was conducted to his throne in the Chamber of Peers by the Duke de Tresme, who filled the office of Lord High Chamberlain. Madame de Ventadour was already seated upon the steps of the throne, and the countenance of her little pupil brightened as he saw her. He exclaimed aloud with childish glee, 'Madame de Ventadour!' 'Hush!' said his governess kindly, whilst with an expressive glance she designated to him the imposing assembly by which they were surrounded. Louis XV. immediately resumed a little air of grave dignity which was natural to him, and began to look composedly around him on the striking spectacle which the court of France of that day offered when assembled in full costume. The young king himself, who formed the centre of attraction in this brilliant circle, was well formed to grace the high post he occupied. He stood erect upon his throne, and awaited with a dignified patience the commencement of the ceremony. It might almost have been imagined that he felt the importance of the functions he was called to fulfil.

Soon the mass of courtiers began to move around the throne, and one great functionary of state after another approached the little king, and addressed him in speeches prepared for the occasion—all of which had one point in common, which was not a little distressing to their young auditor—namely, their interminable length. However, he bore the infliction with great apparent tranquillity, although it must be avowed that his glances were more frequently directed towards the window, where might be seen a tree bending beneath its sparkling, snowy burthen, than towards the grave speakers of very grave and very heavy speeches. When the moment at length arrived for the young king to deliver his speech, the Marshal de Villeroy bent forward, and asked him in a whisper whether he remembered what he had taught him in the morning.

'Perfectly,' he replied.

'Now, then, is the time to say it aloud, sire,' said the marshal.

With perfect grace, and with a certain infantile timidity of manner, which added yet more to the charm of his appearance, Louis XV. repeated aloud, and with perfect correctness—'We, king of France and of Navarre, declare the Duke of Orleans regent of this kingdom, to administer the affairs of state during our minority, conformably to the decree of parliament made on the 3d of September.'

The Duke of Orleans advanced to kiss the young sovereign's hand in token of gratitude, the Council of Regency was then named, and each member of it came forward in turn to perform the same act of homage. Then followed the administration of oaths, more speeches, and an endless routine of ceremonies, which became wearisome to all, but insupportable to the poor child. He at length ceased to listen, his eyes wandered towards the door, he stood up, sat down, yawned, played with the crosses which hung suspended from his blue ribbon, and then pettishly throwing them from him, began to yawn anew. Suddenly his attention seemed arrested by some object in the far corner of the room; his eyes ceased to wander, and were filled with an expression of comic surprise. The marshal, who had been following with anxiety every movement of his pupil, looked in the direction to which the child's glance was directed, and soon discovered that the object of his attention was the old cardinal of Noailles, a prelate of pre-eminent ugliness, which was shown off still more by his scarlet costume, and who was as yet unknown to the young prince, as he had only lately returned to the court, having been disgraced in the reign of Louis XIV.

The marshal, fearing doubtless that the old courtier might be displeased at this marked attention, whispered to his pupil a request not to look so steadfastly in that direction.

'But I choose to look that way,' replied the child.

'It is not polite,' replied his governor.

'So much the worse,' said the king.

'But it is very wrong of you, sire.'

'I am sorry for it; but it amuses me.'

'Listen to this gentleman who is making you a speech, instead of looking about you.'

'I am very tired of hearing him,' replied Louis.

'I beg of you, sire—sire—sire—pray attend to me.'

'Leave me alone,' said Louis impatiently, quite wearied out by the admonitions of his governor and the interminable speeches of his courtiers.

'But, sire, I cannot leave you alone,' replied the marshal: 'you are not here for the purpose of being amused.'

'Ah, my snow, my beautiful snow!' said the king, to whose mind the word *amusement* recalled with vividness his morning disappointment.

'You must not think about that now, sire, but attend to what is going on here.'

'Oh, do leave me alone!' said the king, bursting into tears.

'Sire, sire; pray hold up your head, and do not disgrace yourself in this way.'

The poor little king's tears were, however, unheeded; the wearisome ceremony lasted till the close of the day; and when poor Louis passed the park on his way back to Versailles, the finishing stroke was put to his sorrows, for—the snow had melted!

'Oh, my battle, my snowballs!' he exclaimed, weeping bitterly. To add to his mortification, as he mounted the stairs of his palace of Versailles, he met all his young playmates talking and laughing over the divers feats of prowess which had been performed during the day. They were all glowing with health and animation; and as the pale, wearied Louis passed the merry group, there was not one of them who envied his royal lot.

'Who gained the day?' inquired Louis mournfully.

'The Duke de Chartres,' was the reply; 'but the Marquis de Nesle fought very well too.'

'Come, then, at least, and tell me all about it,' said the little king.

'Sire,' interposed Madame de Ventadour, 'this is the hour for you to retire to rest.'

'Well, then, the hour must be put off,' said Louis pettishly.

'That, sire, is impossible; your gentlemen of the bed-chamber are in waiting.'

'Oh how tiresome it is to be a king!' said Louis XV., his tears commencing to flow afresh as his governess led him to the bedchamber. 'I am always unfortunate: in the winter, I am not allowed to make snowballs; and in the summer, when it is so fine, and everybody walks out, I am kept at home in the palace.'

'Oh, sire,' said his governess, as she began to undress him, 'are you not taken out whenever you please?'

'Am I indeed? And do you think I have forgotten the day of the fête of St Germain, when I was at the window, and saw such numbers of children passing by, and they all looked so happy? I asked you where they were going, and you told me to the fair; and when I asked what this fair was, you told me it was a place where they amused themselves under the trees, and bought toys and sweetmeats; and that in the evening I should see all these children returning with their playthings and their cakes. Oh, how I did long to go! But you were sick, mamma, and so I was obliged to stay at home.'

'You shall go, sire, next year.'

'And in the winter,' resumed the king, 'it is so pleasant to run upon the snow, to make snowballs, to throw them at one's companions, and have them thrown at one's self in return; and now, to-day, they have made me miss the finest battle in the world! When will some snow fall again?'

'Come, sire, you must not think any more of that now, but try to go to sleep.'

'I can't go to sleep: I suppose I shall be told presently that this is the hour at which I must go to sleep, because I am a king!'

'Console yourself, sire,' replied his governess; 'when

you are a man, you will be happier.' As Madame de Ventadour said this, she sighed, for she knew but too well that the future happiness of her little pupil was, if possible, even still more uncertain than the present.

LYELL'S SECOND VISIT TO THE UNITED STATES.

Four years ago, we had occasion to notice the 'Travels of Sir Charles Lyell in the United States,' chiefly in relation to the geological explorations of the author. A 'Second Visit' to the States by the same writer having just made its appearance,* we are enabled to revert to this deeply-interesting subject. On the present, as on the previous occasion, Sir Charles travelled with a special view to the investigation of natural phenomena; but we can assure all who feel inclined to peruse his second production, that it abounds likewise with observations on matters of social concern, and is, on the whole, one of the most amusing works which has for some years appeared on the United States. Having travelled with his wife, the author possessed more than the usual means of acquiring a knowledge of the people among whom he travelled.

Passing over one or two of the earliest chapters, we take up Sir Charles as he journeys through the New England States. Here he has occasion to refer to that very curious phenomenon, the discovery of organic remains in ice. How the bodies of animals become so imbedded, is a question of much interest. It appears that in extreme northern and southern parts of the world, the ground is a mixture of rock and ice, the ice lying in strata below the general surface. In 1821, when the captain of a merchant ship wished to enter the body of a sailor in one of the South Shetland Islands, he set a party 'to dig a grave in the blue sand and gravel; but after penetrating in nearly a hundred places through six or eight inches of sand, they came down everywhere upon solid blue ice. At last he determined to have a hole cut in the ice, of which the island principally consisted, and the body of the man was placed in it.' This body was afterwards found as fresh as when buried. The bodies of whales and other creatures often get imbedded in icebergs, and it is then discovered after the ice has become partially mixed with sand and gravel, that has led to so much learned investigation. The rise and fall of masses of ice, according to the action of the tides, when in contiguity with land, accounts for no small part of the phenomenon.

Talking of icebergs, we are led to remark, that to these floating masses in the Northern Atlantic much of the irregularity of our summer climate may be imputed. Icebergs are occasionally seen as far south as the 36th degree of north latitude, and of immense size. 'Sir James Ross saw icebergs which had run aground in Baffin's Bay in water 1500 feet deep.' An iceberg of much less dimensions than this turns the climate to winter wherever it goes, and its approach to any coast is a terrific visitation. A military officer told our author 'that last year, when he was in garrison in Newfoundland, an iceberg continued aground in the harbour of St John's for a year, and they used to fire cannon-balls at it from a battery.' We have heard of more ridiculous projects than would be the fitting out of an expedition to clear the Atlantic of icebergs by bombardment.

Sir Charles made a pilgrimage to the top of Mount Washington (one of the White Mountains), which reaches to a height of 6225 feet above the level of the sea. Here a Flora was observed similar to that of lands bordering on the sea in the extreme north of America, Europe, and Asia. How did these plants attain this height in an inland mountain in a comparatively southern latitude? 'Geology,' says our author, 'teaches us that the species living at present on the earth are older than many parts of our existing continents—that is to say, they were created before a large part of the

* London: John Murray. 2 vols. 1849.

existing mountains, valleys, plains, lakes, rivers, and seas were formed. That such must be the case in regard to the island of Sicily, I announced my conviction in 1833, after first returning from that country. And a similar conclusion is no less obvious to any naturalist who has studied the structure of North America, and observed the wide area occupied by the modern or glacial deposits before alluded to, in which marine fossil shells of living but northern species are entombed. It is clear that a great portion of Canada, and the country surrounding the great lakes, was submerged beneath the ocean when recent species of mollusca flourished, of which the fossil remains occur more than 500 feet above the level of the sea near Montreal. I have already stated that Lake Champlain was a gulf of the sea at that period, that large areas in Maine were under water, and, I may add, that the White Mountains must then have constituted an island, or group of islands. Yet as this period is so modern in the earth's history as to belong to the epoch of the existing marine Fauna, it is fair to infer that the Arctic Flora now contemporary with man was then also established on the globe.' We have thus to consider that many of the higher mountains were at one time islands, in a sea chilled by the melting of floating ice. 'As the continent grew by the slow upheaval of the land, and the islands gained in height, and the climate around their base grew milder, the Arctic plants would retreat to higher and higher zones, and finally occupy an elevated area, which probably had been at first, or in the glacial period, always covered with perpetual snow. Meanwhile the newly-formed plains around the base of the mountain, to which northern species of plants could not spread, would be occupied by others migrating from the south, and perhaps by many trees, shrubs, and plants then first created, and remaining to this day peculiar to North America.'

Intermingled with interesting disquisitions of this kind are graphic notices of the odd sectarianism—which might almost be called the religious derangement—in many parts of New England. 'At the Franconia hotel I first heard of the recent fanatical movement of the Millerites, or followers of one Miller, who taught that the millennium, or final destruction of the world, would come to pass last year, or on the 23d day of October 1844. A farmer from the village of Lisbon told me that, in the course of the preceding autumn, many of his neighbours would neither reap their harvest of Indian corn and potatoes, nor let others take in the crop, saying it was tempting Providence to store up grain for a season that could never arrive, the great catastrophe being so near at hand. These infatuated people, however, exerted themselves very diligently to save what remained of their property when the non-fulfilment of the prophecy dispelled their delusion. In several townships in this and the adjoining states the parochial officers or "select men" interfered, harvesting the crops at the public expense, and requiring the owners, after the 23d October, to repay them for the outlay. I afterwards heard many anecdotes respecting the Millerite movement, not a few of my informants speaking with marked indulgence of what they regarded simply as a miscalculation of a prophecy which must be accomplished at no distant date. In the township of Concord, New Hampshire, I was told of an old woman who, on paying her annual rent for a house, said, "I guess this is the last rent you will get from me." Her landlord remarked, "If so, I hope you have got your robes ready" (alluding to the common practice of the faithful to prepare white ascension robes) "for going up into heaven." Hearing that there had been advertisements from shops in Boston and elsewhere to furnish any number of these robes on the shortest notice, I took for granted that they were meant as a hoax; but an English bookseller, residing at New York, assured me that there was a brisk demand for such articles, even as far south as Philadelphia, and that he knew two individuals in New York who sat up all night in their shrouds on the 22d of October. . . . In a subsequent

part of our tour, several houses were pointed out to us between Plymouth (Massachusetts) and Boston, the owners of which had been reduced from ease to poverty by their credulity, having sold their all towards building the Tabernacle, in which they were to pray incessantly for six weeks previous to their ascension. Among other stories which, whether true or not, proved to me how much fraud was imputed to some of the leaders, I was told of a young girl who, having no money, was advised to sell her necklace, which had been presented to her by her betrothed. The jeweller, seeing that she was much affected at parting with her treasure, and discovering the object of the sale, showed her some silver forks and spoons, on which he was about to engrave the initials of the very minister whose dupe she was, and those of the lady he was about to marry on a fixed day after the fated 23d of October.' The society of Millerites has since become bankrupt, and their tabernacle has been transformed into a theatre, where the author had the pleasure of seeing Mr and Mrs Kean perform 'Macbeth.'

In a conversation with one of the managers of the Lowell factories, Sir Charles elicits what may be considered a good hint as to an improvement in the position of the working-classes. These factories, it appears, are joint-stock concerns. The shares are often as low as 500 dollars, and held by operatives. 'By this system the workpeople are prevented from looking on the master manufacturers as belonging to a distinct class, having different interests from their own. The holders of small shares have all the advantages of partners, but are not answerable for the debts of the establishment beyond their deposits. They can examine all the accounts annually, when there is a public statement of their affairs.' Unfortunately the law of partnership prevents plans of this kind being carried out in England. To procure an abolition of this law, the working-classes in Great Britain ought to make a strenuous exertion; but when do we find these classes aiming at anything half so practical?

At Boston our author makes the common observation that the New Englanders have generally a pale, careworn look, arising 'partly from their striving and anxious disposition, and their habits of hard work, mental and bodily, and partly from the effects of the climate. One of their lawyers expressed to me his regret that the members of his profession, and their most eminent politicians, physicians, and literary men, would not spare themselves, and give up some time to relaxation. "They seem determined," he said, "to realise the sentiment so finely expressed by Milton—

'To scorn delights, and live laborious days.'

Our ancestors had to work fifteen hours out of every twenty-four, in order not to starve in the wilderness; but we persist in straining every nerve when that necessity has ceased." He then reminded me how much more cheerful, plump, and merry the young negro children looked in the south than those of New England, who had all the appearance of having been forced in their education, and over-crammed at school. I suspect, however, that the principal cause of the different aspect of the Anglo-Saxon race in England and America is the climate. During both our tours through the United States, my wife and I enjoyed excellent health, and were delighted with the clearness of the atmosphere, the bright sun, and the great number of cloudless days; but we were told that, if we stayed a second year, we should feel less vigorous. Many who have been born in America, of families settled there for several generations, find their health improved by a visit to England, just as if they had returned to their native air; and it may require several centuries before a race becomes thoroughly acclimatised. English travellers often ascribe the more delicate health of the inhabitants here to their in-door habits and want of exercise. But it is natural that they should shrink from exposing themselves to the severe frosts and long-continued snows of winter,

and to the intense heat of the summer's sun. An Englishman is usually recognised at once in a party by a more robust look, and greater clearness and ruddiness of complexion; and it is surprising how distinguishable he is even from persons born of English parents in the United States. It is also a curious fact, which seems generally admitted, that the native Anglo-Australians bear a considerable resemblance to the Anglo-Americans in look and manner of speaking, which is a mystery, for there is certainly in that case no analogy between the climates of the two countries.'

New England, as every one knows, is greatly in advance of Great Britain with respect to national education; and on this subject the author speaks of the Americans in language of just commendation. Where all are called on to take part in the action of government, it is felt that the safety of society depends on all being educated. The education imparted is under a general, not party or sectarian management; and every attempt made by religious denominations to acquire a special control over the public schools has been promptly checked. The affected belief that this unsectarian education would lead to irreligion and discontent has been completely falsified. Nowhere are the people more religious or better citizens. 'It is acknowledged by the rich, that when the free schools have been most improved, the people are least addicted to intemperance, are more provident, have more respect for property and the laws, are more conservative, and less led away by Socialist or other revolutionary doctrines. So far from indolence being the characteristic of the labouring-classes, where they are best informed, the New Englanders are rather too much given to overwork both body and brain. They make better pioneers when roughing it in a log-house in the backwoods, than the uneducated Highlander or Irishman; and the factory girls of Lowell, who publish their "Offering," containing their own original poems and essays, work twelve hours a day, and have not yet petitioned for a ten-hour bill.' Further on, the author observes, in reference to the independent position which schools and teachers have attained:—'There is in no state any dominant ecclesiastical body sufficiently powerful to thwart the maxims of those statesmen who maintain that as the people are determined to govern themselves, they must be carefully taught and fitted for self-government, and receive secular instruction in common schools open to all. The Roman Catholic priests, it is true, in the state of New York, where there are now 11,000 schools in a population of 2,500,000, have made some vigorous efforts to get the exclusive management of a portion of the school fund into their own hands, and one at least of the Protestant sects has openly avowed its sympathy in the movement. But they have failed, from the extreme difficulty of organizing a combined effort, where the leaders of a great variety of rival denominations are jealous of one another; and fortunately the clergy are becoming more and more convinced that, where the education of the million has been carried farthest, the people are most regular in their attendance on public worship, most zealous in the defence of their theological opinions, and most liberal in contributing funds for the support of their pastors and the building of churches.'

Sir Charles speaks regretfully of the tendency in New England to cultivate a sour conventional spirit, which discourages innocent recreation, without finding a suitable substitute. The injury arising from this social defect is only in part remedied by the growing taste for reading. In every district there are lending libraries, which prove of great use. 'Towards the purchase of books for these libraries the State grants a certain sum, if an equal amount be subscribed by the inhabitants. They are left to their own choice in the purchase of books; and the best English poets and novelists are almost always to be met with in each collection, and works of biography, history, travels, natural history, and science. The selection is carefully made with reference to what the people will read, and not what men of higher educa-

tion or station think they ought to read.' When will our own legislature vote sums in aid of public district-libraries? Not, it may be supposed, till something less is spent in the apparatus of naval and military armament.

As a matter of course, the author, in travelling, was exposed to the usual amount of questioning as to his age, family, and objects of pursuit; but though annoying, this enabled him to question in return, and by that means to procure valuable information. An American related to him many diverting anecdotes to illustrate the inquisitive turn of his countrymen. Among other stories he gave a lively description of a New Englander, who was seated by a reserved companion in a railway car, and who, by way of beginning a conversation, said, 'Are you a bachelor?' To which the other replied dryly—'No; I'm not.' 'You are a married man?' continued he. 'No; I'm not.' 'Then you must be a widower?' 'No; I'm not.' Here there was a short pause; but the undaunted querist returned to the charge, observing—'If you are neither a bachelor, nor a married man, nor a widower, what in the world can you be?' 'If you must know,' said the other, 'I'm a divorced man!'

INCONSTANCY OF THE DOVE.

In a paper in No. 280, we referred to the unpleasant ideas associated by the Hindoos with the cooing of the dove; a sound which, however sweet and loving to us, seems to them like the wail of a doomed creature commemorating the cruelties it committed in a former state of existence. We still clung, notwithstanding, to the constancy of the dove. We might abandon the minor graces of gentleness, innocence, and timidity; but fidelity in love it still retained in our imagination—

—'all other virtues gone,
Not guilt itself could quench that loveliest one!'

Philosophy, however, is always bursting bubbles, or blowing up steamboats, and Poetry is ruined in breakage by her awkward or malicious handmaid Science. Here is a letter stripping our favourite dove of the last of its fine feathers!

The letter has been presented to us by the courtesy of Mr Waterton, the well-known naturalist; and it is addressed to himself by Mr Ord of Philadelphia, to whom the scientific world is indebted for various contributions to natural history, and for a life of Wilson the ornithologist:—

'I promised you, in one of my late letters, an anecdote concerning the common pigeon, tending to show that inconstancy in conjugal affection is a failing by no means peculiar to the human kind, but may be discerned in the inferior animals. My dovecot, from its position and economy, is an attractive object for the pigeon: hence every apartment is occupied; and when a male disappears, even for a single day—an occurrence by no means unfrequent—an adventurer, always on the look-out for advantages, steps into the vacant domicile, and asserts his right of possession on the principle of pre-emption. A poor little vagrant pigeon, driven from its natal home, sought refuge on my premises. Its flagging wing and simple countenance denoted its youth and its poverty. I enticed it by food: daily acts of kindness produced familiarity. It proved to be a male of uncommon docility and sprightliness; and it soon became a favourite of the whole family. The period of connubial attachment arrived, and my little stranger soon felt the influence of the universal passion. A wandering female responded to his vows of affection; and their union, after the usual ceremonies, was duly consummated.

'The first care of our youthful couple was to procure a dwelling. Day after day did they endeavour to secure some comfortable quarters: even attempts at encroachment upon the rights of others were made; but all in vain. At length one of the residents of the columbary, a fine old male, disappeared: his home-

stead was enviable; and our couple took possession of it, in defiance of the opposition of the widowed occupant, who stood no chance in such a contest. The happy pair, thus domiciliated, lost no time in their domestic economy. A nest was arranged, eggs were laid and incubated, and one squab was the reward of the toil and solicitude of its parents. The offspring grew and flourished until near maturity, when I perceived a commotion in the dovecot: my protégé was engaged in mortal combat, in his own premises, with an intruder, who, from his superior size and strength, rendered the strife unequal, and who finally succeeded in ousting the possessor. While I stood sympathising with my favourite on this unexpected calamity, what was my surprise to find that the supposed intruder was no other than the former proprietor of the mansion, who had been entrapped by some neighbouring poacher, and who had returned to assert his rights! My sense of justice would not allow me to interfere in this affair, although I was tempted to take a part for the sake of the poor youngling, that I observed was maltreated by the wrathful victor. In battles for the acquisition of a home, the male pigeons alone are generally the warriors: hence the difficulty of success, as the pair in possession, by mutual assistance, almost always prove to be too powerful for the assailant.

But in the case in question I noticed a singularity: my favourite's mate appeared to be a passive spectator of the contest; she afforded no succour to her partner in his desperate struggle; and when he was finally expelled, she evinced no disposition to associate with him. Her affection for her offspring, however, seemed to be unabated, as she continued to feed it, and, what I thought strange, she was permitted to do so without any molestation from the conqueror. The mystery was soon explained by the revelation of the fact, that the faithless creature had actually abandoned him whom she had vowed to love and cherish, and had united herself to his enemy. Well might the poet exclaim—"Frailty, thy name is woman!" What! forsake her youthful partner at a crisis when commonly the best feelings of the heart are called into action! Yet such was the fact. Long did the forsaken make the groves vocal with his murmurs; but all in vain. At length his pathetic complaints touched a congenial soul: a kind female tendered him the consolations of sympathy; her love was reciprocated, and former griefs seem now to be forgotten in present enjoyment.

The dove or pigeon is represented by the poets as the emblem of innocence and constancy:—

In constancy and nuptial love,
I learn my duty from the dove.—*Guy.*

The domestic kind are eminently gregarious, and yet they are eternally at war; the slightest cause will provoke their pugnacious habits during the day; but no evening passes without a fight, as if the hour of rest required excitement to render it salutary. As to their connubial constancy, the above-mentioned circumstance will show that there are exceptions to the law of sexual affinity, which, however, should seem to be more faithfully observed in those animals that pair, than in the nobler part of creation, which is so eminently distinguished by the superiority of reason.

THE LANGUAGE OF THE TOMBS.

'EGYPT offers subjects of conversation and meditation which no one can entirely neglect, whoever he may be, if he have eyes to see, a memory to remember, or a sprinkling of imagination wherewith to dream. Who can be indifferent to the tableaux of unaccountable nature on the banks of the Nile? At the spectacle of this river-land, that no other land resembles? Who will not be moved in the presence of this people, which of old accomplished such mighty deeds, and now are reduced to misery so extreme? Who can visit Alexandria, Cairo, the Pyramids, Heliopolis, Thebes, without

being moved by reminiscences the most imposing and the most diverse? The Bible, Homer, philosophy, the sciences, Greece, Rome, Christianity, the Monks, Islamism, the Crusades, the French Revolution: almost everything great in the world's history seems to converge in the pathway of him who traverses this memorable country! Abraham, Sesostris, Moses, Helen, Agesilaus, Alexander, Pompey, Cæsar, Cleopatra, Aristarchus, Plotinus, Pacomus, Origen, Athanasius, Saladin, St Louis, Napoleon—what names! what contrasts! Thus exclaims an eloquent writer in the '*Revue des Deux Mondes*:' but his list of memorabilia, M. Ampère very well knows, begins where the really marvellous ends; and to arrive—not at the origin of Egyptian civilisation, but merely at the epoch where our researches are lost in the darkness of antiquity—we must go back at least fifteen centuries before the calling of Abraham! With Moses, between two and three hundred years after the first patriarch, begins the procession of the historians, lawgivers, and warriors of a world now passed away; but in the tombs of Egypt there are written, with a freshness that endures to this day, the annals of a long anterior greatness—a greatness earlier than antiquity itself.

Egypt is now the great highway between the East and West; and one may as well stay at home as pretend to travel without seeing the Pyramids. To enjoy, however, the descriptions we receive from every succeeding tourist of a buried people, who, 2400 years ago, reproached the ancient Greeks with their modern juvenility, it is necessary to know from what sources these records are drawn, and what are the claims to authenticity possessed by the Language of the Tombs. To do this, we do not require to understand the ancient tongues, or any other modern one than English; Colonel Vyse having thrown into an appendix, in the second volume of his quarto work, all that is known on this subject.* But a much smaller book has recently been published, touching upon all the Egyptian questions together; and although, from the highly-condensed form in which the knowledge is conveyed, it is somewhat difficult of study for persons previously ignorant of the subject, we are in hopes of being able to extract from it, for the benefit of our readers, some rudimentary information. It consists of a series of reports, taken from several American newspapers, of the lectures of the distinguished Egyptian antiquary Mr Gliddon; and the whole has been revised by himself, and enriched with learned notes and appendices.†

Previous to the year 1802, the hieroglyphics, or sacred characters of the Egyptians, found in the sepulchres and on monuments, were a mystical scrawl, the unknown signs of an unknown tongue, which the learned gazed at with unavailing longings. But a stone, found three years before between Rosetta and the sea by a French officer of engineers, was destined to give the hint, which fell like a sudden spark of light upon their conjectures. This was the celebrated Rosetta Stone (now in the British Museum), a fragment of black basalt, 3 feet in length, and originally 2 feet 5 inches in breadth, and from 10 to 12 inches in thickness. The sculpture was not in itself of great antiquity, dating 196 years before the Christian era. It contained two inscriptions—one in the Greek, and one in the popular Egyptian character, called Demotic or Enchorial, afterwards discovered not to have been much used before 700 years B.C.: but there was likewise a third, in hieroglyphics; and it may be supposed with what interest it was discovered that these three were identical in substance! They were an edict chiselled at Memphis, in honour of Ptolemy Epiphanes, and the concluding sentence was in these words:—"That this

* Operations carried on at the Pyramids of Ghizeh from 1837 to 1839. See also Gliddon's Chapters on Early Egyptian History, 1843.

† *Otia Egyptiaca*: Discourses on Egyptian Archaeology and Hieroglyphical Discoveries. By George R. Gliddon. London: Madden. 1849.

decree should be engraved on a tablet of hard stone, in hieroglyphical, enchorial, and Greek characters, and should be set up in first, second, and third-rate temples, before the statue of the ever-living king.'

The inscriptions being identical, would of course repeat the name the same number of times; and the word Ptolemy, in its various inflections, being found in the Greek eleven times, the first business was to look for a corresponding word in the Demotic character. In this inscription a group of seven letters was found repeated eleven times; and these were discovered to compose the word Ptolmis, thus giving seven letters of the alphabet, from which the whole was afterwards deduced. But the hieroglyphic inscription? How was it possible to interpret those representations of animals and things, intended though they must be for the symbols of a language? Here and there some of them were enclosed in an oval. This was repeated again and again, and must no doubt be the name sought for. The middle figure was a recumbent lioness, the Coptic name of which is *laboi*. Might not the lioness represent the *sound* of the initial letter of her own name? It was a wild and fantastic conjecture, to which the explorer was no doubt driven by mere despair; but it was inspiration. The moment it was taken for granted that this was one letter of the name, the others were read with comparative ease; and thus were obtained to begin with the signs of seven hieroglyphical letters, PROLMEEES.

We of course cannot pretend to follow here the course of the discovery; but Mr Gliddon declares, that with the aid of the published literary resources, any intelligent person may at this day read into English, direct from the hieroglyphics, words, phrases, and consecutive sentences, as easily as he would acquire any other Oriental tongue. The revelations thus made have released Egypt from the plague of darkness. She is no longer a land of sorcery and mysticism, such as she appeared to the Hebrews, Greeks, and Romans; but thousands of years ago, her every-day life appears a prototype of our own. The hieroglyphics are at once manuscripts and pictures—illustrated books, speaking at once to the eye and the mind; and the genius of the people seems to have delighted in perpetuating themselves in their records. 'If we enter a tomb,' says Mr Gliddon, 'we see the deceased surrounded by his family, who offer him their remembrances. The—I had almost said Christian—name, the profession, rank, and blood-relationship of each member of the family, are written against him or her. The scenes of ordinary life are painted on the walls. Study, gymnastics, feasts, banquets, wars, sacrifices, death, and funeral, are all faithfully delineated in these sepulchral illustrations of manners, which are often epic in their character. You have the song with which the Egyptian enlivened his labour in the field; the anthem that, when living, he offered to his Creator; and the death-wail that accompanied his body to the grave. Every condition, every art, every trade figures in this picturesque encyclopædia—from the monarch, priest, and warrior, to the artisan and herdsman. Then these tombs are real museums of antiquities—utensils, toilet-tables, inkstands, pens, books, the incense-bearer, and smelling-bottle, are found in them. The wheat which the Egyptian ate, the fruit that adorned his dessert-table, peas, beans, and barley, which still germinate when replanted, are also discovered. The eggs, the desiccated remains of the very milk he had once used for his breakfast, even the trussed and roasted goose, of which the guests at his wake had partaken—all these evidences of his humanity, and a myriad more, exist, in kind, in the museums of Europe, to attest their former owner's declaration to us, modern occidentals, athwart the oceans of time and the Atlantic, *Homo sum; humani nihil a me alienum puto*. But not only do the scenes sculptured or painted on the temples or in the sepulchres furnish every detail concerning the Egyptians; they give us the portraits, history, geographical names, and characteristics of an infinitude of Asiatic and African nations existing in days long anterior to the

Exode—many of whom have left no other record of their presence on earth, and others again whose names are preserved in the Hebrew Scriptures.'

Not the least curious and important of the hieroglyphical revelations, is the synchronism which exists between the Scriptural annals and the monuments of Egypt. The names of some of the Pharaohs are not only the same, but they are identified in particulars of their history; and authenticated *portraits* of sovereigns incidentally referred to in the Bible are now exhibited in engravings throughout the Christian world. These portraits are carried back to 3500 years ago (about the time of Joseph), but the synchronism cannot be traced earlier than 971 B.C. This is unfortunate, as it would be very interesting to identify in their monuments the Pharaohs who were contemporary with Solomon, Moses, Joseph, and Abraham. The earliest, however, as yet reached is Shishak, the conqueror of Rehoboam, son of Solomon; and indeed, as the Bible does not mention by name the earlier sovereigns of Egypt, there is little probability of farther advance in this interesting study. As for the supposed death of the Mosaic Pharaoh in the Red Sea, it is neither countenanced by the text of the Pentateuch—which merely relates the destruction of Pharaoh's host, chariots, and chosen captains—nor by the traditions of the Talmud, which expressly state that the king returned and reported the loss of his army. The hieroglyphics, however, are silent on both points. Neither has any trace at all been found in them of the patriarchal relations with Egypt. We may add that Mr Gliddon makes the pertinent remark, that if the validity of hieroglyphical history be proved 'from the Scriptures for the times succeeding Moses, in all those cases where either record refers to the events mentioned in the other, the authenticity of hieroglyphical monuments in affairs whereon the Bible is silent, and which antedate Moses by twenty centuries, cannot fairly be called in question.' While mentioning portraits, let us descend to later times, and say that the portrait of Cleopatra, taken from the temple of Dendera, by no means establishes the Shakspearian authority with regard to the personal beauty of that 'serpent of old Nile.' The Cleopatra of history appears to have been celebrated only for her powers of fascination and the splendour of her court.

The earliest date of the sacred language is not known; but if the antiquaries are correct, there must be an error in the commonly-received interpretation of Bible chronology, the original fifteen hieroglyphic letters having been in *common use* only 250 years after Menes the first Pharaoh. This would carry back the origin of hieroglyphics to near the time commonly assigned to Cain and Abel! The emblem of the scribe's palette, reed-pen, and ink-bottle, is found about 3400 years B.C.; and books, indicated by the sign of the papyrus or scroll, are long antecedent to the time of Abraham. This language received afterwards some change, and in that form became more current as the hieratic or sacerdotal. About 700 years B.C. there was introduced an alphabetic kind of writing called the Demotic, Enchorial, or Epistolographic; and this remained in popular use till it was suppressed by Roman imperial authority, and replaced by the Coptic alphabet, formed of Greek and Egyptian letters intermixed.

The prayer-book of the Egyptians, called the Book of the Dead, is traced as far back as 3200 B.C. It was a collection of hymns and liturgical prayers offered by and for the departed Egyptians; and extracts from it are met with on mummy cases, and every other object connected with death or religion. In this antique ritual are taught the doctrines of the soul's immortality and resurrection of the body; but instead of the Jewish commandments, and the Christian petitions for Divine aid to observe them, they present only a series of self-righteous assertions of innocence, supposed to be made by the departed spirit. In these, however, which are forty-two in number, is found the whole, and more than the whole, decalogue.

It is impossible to ascend to the origin of the mummies that are covered with extracts from this ritual. Mummification, as the science is now called, is supposed to have been earlier than the Pyramids or tombs, the first mummies having been buried in the sand. The Necropolis at Memphis is twenty-two miles in length by about half a mile in breadth, and here, it is supposed, one-fourth of the population of Egypt was buried. The Great Pyramid was built 4000 years ago; but supposing the period of mummification to be only 3000 years, Mr Gliddon calculates that the number of mummies in Egypt is about 500,000,000. A Cairo journal, a year or two ago, went further: it counted up the quantity of cloth in the wrappers, and came to the conclusion that if the linen were manufactured into paper, it would bring into the pasha's treasury L.4,200,000! The objection as to the vast space so many mummies would fill, is met by a calculation which shows that they could be contained in a cube half a mile in length, breadth, and height; although, so far from being cramped in room, the tombs of a single individual sometimes cover several acres of subterranean ground.

Under the fourth dynasty the bodies were prepared by saturation with natron, and were baked in ovens, and wrapped in woollen cloth. The sarcophagus of Cheops was a plain monolithic bin, and that of Mycerinus a rectangular chest, with an inscription in which the dead Osirian king is saluted with a sublime simplicity, 'Live for ever!' Under the twelfth dynasty linen is found in use, the bodies are partially gilded, and all the luxury in coffins had commenced which, from the eighteenth dynasty down to the time of the Romans, remained at a great pitch of extravagance. Under the eleventh dynasty, round the 'sides are usually painted the whole sepulchral equipment of the dead—his bows, arrows, quivers, shirts, wigs, mirrors, sandals, and cosmetics. They are, in fact, the pictorial portmanteau of an Egyptian gentleman twenty centuries before our era, as well as a bill of fare: his ducks, geese, haunches, shoulders, chops, bread, cakes, biscuits, flour—his drinks, water, beer, wine, white, northern, or Maræotic—his salt and pastiles—are detailed at the head of these coffins.' The eighteenth dynasty is the era of the introduction of bitumen, which became known to the Egyptians through their conquests of Assyria; and the new fashion changed the colour of the mummies, which, since that epoch, are black, while those earlier embalmed are of the natural hue. By this time the system of idolatry had attained its full development; even the bodies of animals were at length embalmed as well as those of men; and the religious simplicity of the earlier mummies existed no more. About the Augustan period the shape of the sarcophagus was changed, and the mummies were not wrapped in the human form, but of an equal thickness all down, and swathed in a coarsely-painted cloth exhibiting portraits of the deceased.

The cost of these embalments varied from L.4 up to L.250, according to the rank in life of the deceased, and the luxury of the coffin and ornaments. There are specimens still in existence which contain above 1000 yards of linen, varying in texture from good calico to superfine cambric. The majority, however, belong to the middle-classes, and their cost is estimated at L.60: but calculating them all at the cheapest—namely, L.4—this would give an annual expense for manufacture of L.666,000. For our own part, however, unless the lowest classes were mummified at the public cost (which is very improbable), we do not see how even L.4 could have been paid for their funeral expenses; and as Mr Gliddon remarks that only a single negro mummy has been found, although negroes were always very numerous in Egypt as domestic servants, there must, we think, have been a portion of the population allowed to moulder in the usual way. The whole of the revenue arising from this process belonged to the priests, 'who were the physicians, apothecaries, mummy-makers, undertakers, scribes, and sextons, and who, besides, leased out the sepulchral excavations in which the bodies were to

repose.' They held also the monopoly of the linen cloth used for wrapping the body, the flax for which was grown and manufactured by themselves. The mummies made, however, were so strictly the property of the purchasers, that a debtor was obliged to give up in pledge to his creditors the remains of his ancestors; and if he died insolvent, his next relations were held bound, both in honour and law, to redeem them.

The Pyramids, it is now known, were sepulchres for containing the mummies of the Pharaohs. 'As to the epoch of those of Memphis,' says Mr Gliddon, 'these were all built between the times of Noah and Abraham in the scale of Biblical chronology, and those of Menes, the first Pharaoh of Egypt, and the founder of the first dynasty at Memphis, and the thirteenth dynasty in collateral Egyptian hieroglyphical chronology. Thus all the Memphite pyramids existed and were ancient 2000 years before Christ. All the pyramids in Lower Egypt are 4000 years old; and taking the pyramid of Mæris, according to Lepsius' letters, built between 2151 and 2194 years before Christ, as the last of this series, the remainder will successively recede to above 5000 years ago.'

When a king commenced his reign, a small isolated hill of rock was fixed upon for his tomb, and a chamber excavated in it, with a passage communicating with the surface. Around and over this a course of masonry was built in a four-sided figure, converging at the top, in general of limestone, but in four instances of sun-dried brick; and if the death took place during the year, this was immediately cased over, and thus a small pyramid formed. If the king lived a second year, another course of stone or brick was added, and so on another and another, till, as in the case of the Great Pyramid, the solid materials thus piled over the chamber in the rock would suffice for the construction of a city. 'The pyramid continued to be increased every year until the death of the king in whose reign it was erected, fresh courses being added each year of his life. When the king died, the work of enlargement ceased, and the casing was put on the pyramid. This was done by filling up the angles of the masonry with smaller stones, and then placing oblong blocks one upon another, so as to form steps from the base to the apex; after which, beginning at the top, and working downwards, these stones were bevelled off at the corners, so as to form one uniform angle, and give a smooth surface to the pyramid, leaving a perfect triangle. . . . Two conclusions will strike the observer: first, that a pyramid, being smooth from its base to its summit, was by its builders never meant to be reascended: secondly, that the entrance was hermetically closed, never to be reopened; although its location, to judge by classical and Arabian traditions of hieroglyphics on the exterior, was probably indicated by a royal tablet, or stele, commemorative of the Pharaoh interred in each sepulchre. . . . The philosophical deduction from all this is, that the size of the pyramid is in direct proportion to the length of the king's reign in which it was constructed, having been begun at his accession, and finished at his death. Large pyramids indicate long reigns, and small pyramids short reigns. The sixty-nine pyramids, therefore, represent some seventy or eighty kingly generations (two kings having been sometimes buried in the same pyramid), the last of which race died before Abraham was born. Such is the law of pyramidal construction. Of its importance in chronology the reader can judge.'

In the Great Pyramid there are several chambers: the Great Hall, the Kings' and Queens' Chamber, the Well, as it is called, &c.; and there are air-passages communicating from these with their external surface. The casing-stones were eight tons in weight, but were removed by the caliphs, so that the edifice can now be ascended as if by the steps of a stair. There is no danger either in the ascent or descent; although, in 1831, Mr James Mayes, an English traveller, contrived to commit suicide by throwing himself from the summit.

The private tombs scattered around the regal pyramids are full of interest of the same kind; being covered with paintings of the manners, customs, genealogies, &c. of the ancient Egyptians to such an extent, that the antiquary Lepsius promises to write the *Court Journal* of the fourth Memphitic dynasty, which flourished five thousand years ago! 'The manufacture of glass,' Mr Gliddon tells us, 'was known in Egypt 2000 years previously to its reported discovery by the Phoenicians; and the decimal system of numeration, *units, tens, hundreds, thousands,* and upwards, was current in the days of the Pyramids, or 4000 years before the Arabs of Mohammed's era. In the tomb of Eimeï, architect of the pyramid of Shopho, of the fourth dynasty, is an inventory of his wealth. There are, amongst other details, "835 oxen, 220 cows, with their calves, 2234 goats, 760 asses, and 974 rams." The numerals are hieroglyphical *ciphers*; and the same decimal system is found in the *quarriers' marks* on all the pyramids. Indeed it became evident that perhaps, with the exception of steamboats, electrotypes, Daguerreotypes, the magnetic telegraph, chloroform, printing-presses, and cotton gunpowder, the arts and sciences, were much the same at that early period in the Valley of the Nile as at this time in our own country. The drawings of the trades, as found pictured on the walls in the tombs, show the practical sort of people the Egyptians were.' Corroborations of the last remark are to be found in the various paintings now extant of 'carpenters at work, boat-building, musicians, poulterers, veterinary surgeons, wine-pressing, brick-making, weaving, ploughing, transporting of columns,' &c. All these are illustrated by, and serve as illustrations of, that sacred language which, at the end of fifty ages, speaks to us from the tombs almost as intelligibly as it did to the priests at a time which could only be known to the Jewish patriarchs as an old-world tradition.

Having now run through these lectures—although not in a cursory manner, for one must pick his steps while traversing such a mass of erudition—we have only to recommend the volume to the studious reader, as one from which he will receive as much general information on Egyptological science as he could obtain by the perusal of a variety of more bulky, though not more learned, productions.

NEW HYPOTHESIS OF CONSUMPTION.

[We have received the following communication from Mr D. B. Stone of Bristol; and our readers will probably be interested by the novelty of the author's conjectures, and more especially by the hopeful view he takes of a disease which has hitherto remained a standing opprobrium of the medical art. We are not competent ourselves to form any judgment of the real value of the hypothesis; but nothing which serves to stimulate thought and inquiry can be useless.]

I have ventured to address the following remarks to you (for reasons which I shall by and by state), believing that they contain the true explanation of the nature and causes of that fearful malady, 'pulmonary consumption;' fearful, not so much from the number of its victims, as from the circumstance that it is most fatal—not in infancy, when life is without plan, and attachments are but vague—not in old age, when the powers of mind and body are feeble, and seem but to wait to be suspended by an attack of some disease incidental to that period of life—but from its ravages being almost confined to youth and dawning maturity, when life is in its spring, and when those attachments are formed, and engagements entered into, intended to cease but with existence. I shall not now attempt to point out the reasons why this disease has hitherto baffled the inquiries of physiologists, but proceed at once to explain what I, with great confidence, believe to be its nature and causes.

Life, or at least animal life, may be considered to be a prolonged struggle between opposing forces: the oxygen of the air endeavouring to unite with the various tissues and fluids of the body, and the vital forces preventing this union beyond the extent required for the maintenance of the conditions of health. Death is a suspension of those forces, and the consequent decay is but a recombination of the constituents of the body among themselves with the oxygen of the air. The various organs of which animal bodies are composed consisting almost entirely of carbon, hydrogen, oxygen, and nitrogen, the products of decomposition are carbonic acid, from the union of oxygen and carbon; ammonia from that of the nitrogen with part of the hydrogen; the remaining hydrogen escaping either free, or in combination with the small quantities of sulphur and phosphorus found in some of the tissues of sulphuretted or phosphoretted hydrogen. I have conceived it to be better thus to explain scientifically the nature of decay; the popular idea not getting beyond destruction or perishing.

It is now well understood that the office of the lungs is to expose the blood to the action of the atmosphere, and bring about the union of the carbon of the one with the oxygen of the other, producing animal heat. Now it seems impossible to effect this if the substance of the lungs were of a compact or hard nature, or without their presenting a very extended surface to the inspired air; this being contrived by their minute subdivision into an incalculable number of cells. Bearing these facts in mind, and remembering also that the materials of which the lungs are composed are obtained from the constituents of the blood, and are chemically identical with them, there will be no difficulty in perceiving that there is extreme liability of the substance of the lungs, in breathing, to enter into combination with the oxygen of the air, or, in other words, decay. To counteract this tendency, the vital forces are in action, and, in a state of health, are quite adequate to prevent the structure of the lungs from being impaired; but if these forces be from any cause so reduced as not to produce this result, decay of their substance, indicated by tubercular deposits, as they are termed, follows.

It seems here necessary to say something of the vital force. Of its higher manifestations the writer is here silent; but of that portion constituting animal and vegetable life, there seems to be every reason to believe it to be either electricity (as Mr Smee in his late work has attempted to show), or some modification of that surprising agent. Consumption, then, I conceive to be simply a decay of the lungs, and other soft tissues occasionally (tubercles being frequently found in consumptive patients in the brain, and various other parts of the body), from a deficient supply of this protecting influence; and tubercular deposits, to be organic matter in an early stage of decay. To explain my meaning further, take an illustration in close analogy:—The function of the stomach is to digest or dissolve, by the action of the gastric juice which it secretes, organic bodies submitted to it; but this secretion has no action whatever on the substance of the secreting organ, which is protected by the agency of the vital force; though it readily dissolves muscular fibre, or even part of the stomach of a dead animal: just such an influence does vitality exert over the lungs and other soft tissues which it protects from the oxygen of the atmosphere.

It will be seen how completely these views are in accordance with what has been observed of this disease. Persons so afflicted suffer most, and the consummation is hastened most rapidly during the colder months, when, as modern chemistry has revealed to us, a larger quantity of oxygen, principally through the displacement of aqueous vapour, is contained in a given volume of atmospheric air inspired by the lungs, and which at each inspiration is a constant quantity. In an enumeration of the causes of consumption in the 'Penny Cyclopædia,' we find: 'Next to hereditary transmission of the consumptive diathesis, the causes in producing this

state of constitution are a sedentary life, more especially when associated with a confined posture of the body and impure air; bad quality, or insufficient quantity of food; insufficient clothing; excessive mental or bodily labour; mental depression; and abuse of spirituous liquors.

I need scarcely point out in detail the harmony of the preceding theory with this statement. And it will, I think, be admitted, that in the great majority of consumptive cases a want of buoyancy of feeling manifests itself, indicating, from whatever cause it may arise, a deficiency of nervous energy; and although to this it may be objected that the nervous stimulus supplied to the lungs is not from the brain, but from the ganglions of the excito-motory system, yet every physiologist is aware of the intimate sympathy existing between the brain and that portion of the nervous arrangements. It is not a little remarkable, if this theory be the true one, that *phthisis*, the scientific name for consumption, means decay or corruption; thus arriving at the very threshold of the true explanation, and shadowing forth, as in numerous other instances in science, important discoveries arrived at by a better method.

The mode of treatment, then, which these views suggest as a remedy for consumption, is to strengthen, in most cases, by increasing the healthy activity of the nervous system; just in the same way in which cures have taken place, to appearance spontaneously in some individuals, after unmistakable symptoms have presented themselves; when, on removing to a warmer climate, or from a painful or monotonous occupation, which has depressed the nervous system, new scenes and incidents have excited a vivid interest; thus increasing the power, or, to vary the phrase, the quantity of the vital force. The present practice of acting as though there were no remedy, because *medicine* furnishes none, is obviously calculated to aggravate the existing causes by further depressing the nervous powers.

A word before closing on the method employed in the preceding explanation. Mr J. S. Mill, than whom there does not exist a higher authority, in his 'System of Logic,' after explaining and illustrating the inefficiency of the methods of direct observation and experiment in investigating physiological phenomena, says: 'Neither, again, after physical science had attained a certain development, could there be any real doubt where to look for the laws on which the phenomena of life depend, since they must be the mechanical and chemical laws of the solid and fluid substances composing the organized body, and the medium in which it subsists, together with the peculiar vital laws of the different tissues constituting the organic structure;' and again: 'The insufficiency of these resources (those of direct induction) is so glaring, that no one can be surprised at the backward state of the science of physiology; in which, indeed, our knowledge of causes is so imperfect, that we can neither explain, nor could, without specific experience, have predicted many of the facts certified to us by the most ordinary observation.' He then shows that the *à priori*, or deductive method, is that which is alone practicable; and this I have endeavoured to apply, proceeding from the known laws of the oxygen of the air and of the elements of organized bodies, and their tendency to enter into combinations with the influence, so far as known, of the preservative power of the vital forces; and then verifying the results, by showing them to be in harmony with what is known empirically of the disease to be accounted for. I cannot help remarking in addition, that in the above quotations from Mr Mill must be found the reasons why the elaborate works on consumption extant, with their tables of duration, and microscopic appearance of the tubercles, have hitherto furnished no explanation, and consequently no remedy, beyond a palliative for that fearful disease.

The novelty of the above views rendering their rejection all but certain with the medical periodicals and profession, there remained but a single resource: I have

therefore submitted them to you as editors of a periodical of general literature, and now place them at your disposal.

INCOMBUSTIBLE MEN.

THE following extracts from a paper by Mr P. H. Bouligny, having for title 'Quelques Faits relatifs à l'état Sphéroïdal des Corps. Epreuve du Feu. Homme Incombustible,' &c. which appeared in the 'Comptes Rendus' of the French Academy for May 14, will probably interest our readers:—

In France, in England, in Italy, in all places where I have had occasion to speak of bodies in a spheroidal state, I have met with persons by whom the question has been put to me, 'Should not some relation exist between these phenomena and those of men running barefooted over liquid brass, of a white heat, or those where we hear of the hand being plunged into melted lead, &c.?' I have invariably replied, 'Yes, I believe there to be an intimate connection between all these facts and the spheroidal state;' and I have afterwards, in my turn, asked, 'Did you witness any *one* of the instances to which you refer?' and the answer invariably has been in the negative. I confess that these queries, added to the marvellous tales which I had perused in various works concerning the proof by fire, and incombustible men, admitted without reserve by some, and by others as obstinately disbelieved, warmly excited my curiosity, and rendered me extremely desirous of establishing the truth of such phenomena, and recalling them to the memory of the present day; for it is all, alas! as old as the hills—*Nil sub sole novum*.

I wrote, in the first instance, to my friend Dr Roché, who passes his life in the midst of the furnaces of the Department de l'Eure, and who is the healer of bodily ills to a portion of the Cyclopean population which it supports. His answer was to the effect, that a man named La Forge, aged about thirty-five or thirty-six, and very robust, frequently walked with naked feet upon the melted metal, immediately after its being poured into the trenches for casting into pigs: but he had not witnessed it himself. This was not sufficient to dissipate my doubts. I then betook myself to a foundry in Paris, where they smiled, and showed me the door. I said nothing, but withdrew, musing on the difficulties attending the verification of a solitary fact—*itself very simple*.

A short time subsequently I was fortunate enough to meet with M. Alphonse Michel, who resides among the forges of Franche-Comté. M. Michel with great kindness promised that he would institute careful inquiries, and communicate to me the results. The subjoined is an extract from a letter which I have received from him, dated 26th March last:—

'On my return, I did not omit to speak with the workmen concerning the subject of our conversation, and generally was laughed at for my pains. This, however, did not rebuff me. One day, at length, finding myself at the forge of Magny, near to Lure, I renewed my questions to a workman, who assured me that nothing was more common; and to prove his assertion, at the moment when the brass in a state of fusion was pouring forth from a *Wilkinson*, he passed his finger through the incandescent jet. An employé of the house repeated the experiment with impunity; and I myself, emboldened by what I beheld, likewise effected it. I would remark, that in making these trials, neither of us moistened our fingers.

'I hasten to make you acquainted with this fact, which appears to me to support your ideas in relation to the globular state of liquids; for the fingers being naturally more or less humid, it is, I think, to this humidity passing into the spheroidal condition, to which their momentary incombustibility must be attributed.'

I have made the following experiments:—I have divided or cut with my hand a jet of melted brass, exceeding two inches in diameter, which sprang from the plug-hole of the melting pot, and immediately afterwards I have plunged my other hand into a mass of incandescent metal truly frightful to gaze upon: I shuddered involuntarily.

Nevertheless both hands remained perfectly unscathed; and at the present moment, if anything give me cause for astonishment, it is that such experiments are not altogether common and every-day matters.

It will probably be demanded of me, what precautions are necessary to preserve one's self from the destructive action of incandescent matter? I reply, *None!* Have no fear, but make the experiment with confidence, and pass the hand rapidly, yet not too much so, through the liquid brass: otherwise, if the trial be made timidly, and the action be too rapid, the resisting power possessed by all incandescent bodies will exhibit itself at the cost of the experimentalist.

The experiment succeeds best when the skin is in a state of perspiration; and the trepidation occasioned by the vicinity of such masses of fire is highly conducive to placing the body in the state of moisture necessary for its proper performance: but on taking certain precautions we become absolutely invulnerable. I have found the following mode to answer best:—After rubbing my hands with soap, so as to give to them a polished surface, I at the moment of making the experiment steep the one I am about to employ in a cold solution of sal-ammoniac, impregnated with sulphuric acid; or, in place of that, fresh water. Regnault, who is engaged on this subject, says, 'Those whose profession is the handling and eating of fire, sometimes employ a mixture composed in equal parts of spirit of sulphur, sal-ammoniac, essence of rosemary, and onion juice.'

M. Bouigny concludes by saying that the experiment, so formidable in appearance, is almost insignificant in reality, and that he has frequently repeated it with lead, bronze, &c. and invariably with like success.

THE SHORT-TIME AND RELAY SYSTEMS IN FACTORIES.

A QUESTION affecting the wellbeing of a large class of operatives, and the prosperity of their employers, is now agitating the manufacturing districts. It relates to the duration of daily labour in factories, and may be called the 'Long-Time Question,' in opposition to the 'Short-Time Discussion,' till that was resolved by the Ten Hours' Act passed in 1847.

This measure having come into operation about a year since, we are now able, from data supplied from authentic sources, to judge of its effects in connection with what the other factory acts have done for women and children,* and to remark upon a means of evading these acts, which the masters have recently adopted by what is called the 'Shift and Relay System.'

It would appear that, on the whole, the Short-Time System has worked well. It was at first feared that the reduction in the hours of labour, necessarily lessening the amount of wages, would diminish the personal comforts of the operatives, and that they—for whose especial benefit the act was passed—would be eager to have it rescinded; that, moreover, their spare time would be spent in idleness and profligacy.

Happily these fears have not been realised. There has been no diminution of wages that has not been practically made up by equivalent advantages. It has been found that the lessened amount of money received at the end of the week or fortnight is by no means in proportion to the reduction in the number of hours, except in Scotland, where it is precisely the same—namely, one-sixth. In England, under the old system, the two last hours of the twelve were not those in which the greatest energy and vigilance were shown; while under the new, the hands are enabled in ten hours to do more work, and in a better style, than they could in the first ten hours of a working-day; hence their wages are not so liable to abatements for bad work, and to fines for negligence. The masters have also found it necessary to accelerate the speed of the machinery, so that a

greater amount of work is turned out in the shorter time. The reports of the English factory inspectors inform us that the operatives get through their tasks with more hearty good-will, with greater care and attention, and in better spirits, than heretofore. We are also told that the spare hours have been employed profitably and well; so much so, as to aid materially in counterbalancing any pecuniary loss sustained by the daily loss of two hours' pay. The females are able to attend to their household duties themselves, instead, as under the old system, of being obliged to employ hirelings; and, in consequence, their households are better and more frugally kept. The factory children have now time to acquire some education; for one clause in the act of 1844 provides that where there is a good school in the neighbourhood, children from eight to thirteen years of age shall attend them half the day, and work the other half. 'A combination of trade and school for such young persons,' says Mr Leonard Horner, one of the factory inspectors, 'is attended with great advantages. Their intelligence and powers of observation are quickened by their employment, and by living more amongst older people; school is made less wearisome; and their wages, small though they be, are more than sufficient to clothe them, and to pay for their education.' It would appear, indeed, that, with few exceptions, all the educational clauses of the Factories' Acts relating to children and young persons have worked well.

The effects of the new system upon the adult males have been equally beneficial. The strict enforcement of the former acts applicable to women and young persons employed in factories has had a tendency to increase the demand for the labour of men, and to keep up their wages. Neither has their spare time been misapplied. 'I find much more garden ground is cultivated in the suburbs of large towns than formerly,' writes the inspector over one-third of the manufacturing districts of England. 'It is no uncommon occurrence for hands who are employed at a factory to be residing in surrounding villages at a distance of four and sometimes five miles from their work. This reminds me not to pass over unnoticed a remark made to me by a medical practitioner of much experience—"That the hands under the Ten Hours' system enjoy an advantage which you cannot appreciate in money, but to the value of which they are keenly alive—improved health." In truth, it needs not medical authority to prove that all, especially young girls and boys, must be benefited by walking long distances to and from their work, which, if not always sedentary, is often performed in close apartments. The benefits of the Short-Time movement are, it would seem, fully and extensively appreciated by the operatives themselves: there is a common expression among them, 'I would rather give up a meal a day than go back to long hours.'

To the workpeople, therefore, it would appear that the Short-Time Acts have been generally, though not universally, acceptable. The exception is Scotland; and it may be noticed as characteristic, that the operatives here so much prefer, if not performing the maximum amount of work, receiving the maximum amount of wages, that many of them have struck in consequence of the reduction of hours and pay. Mr Stuart, the Inspector of Factories for Scotland, reports as follows:—'Very many of the persons employed seem to have taken it for granted that when trade revived, as it has done, they would be able to prevail on their employers to pay them twelve hours' wages for ten hours' work; and their disappointment that wages are not raised to the old standard is such, that while I was in Glasgow for a fortnight in the month of April, several thousands of them discontinued to work, and about 4000 I hear still (1st May) hold out, refusing to receive less than their old wages. I had frequent opportunities at Glasgow of communicating with the employers and employed of all classes; and I am very much inclined to think, from all I heard or observed, that the latter, with the excep-

* The 'Factories' Act,' passed in 1844 (7th Vic. c. 15), and the 7th and 8th Vic. c. 29, solely applicable to print-works.

tion of married women having families to attend to, and of overseers, clerks, and enginemmen, who, on account of skill or superior qualifications, must have extra wages, would far rather have twelve hours' wages and twelve hours' work, than ten hours' wages and ten hours' work.'

Taking, however, the whole population of operatives in Great Britain, it may be with confidence stated that the Factories' Acts relating to women and children, and the more recent 'Ten Hours' statute, have worked well for those on whose behalf they were enacted. They have appreciated the benefits so conferred on them, and have not misused the leisure the legislature has been the means of affording them.

But as there are two sides to every question, and as there is no good unmixed with evil, so the interference of the legislature with factory labour has already caused some serious difficulties and embarrassments to the masters, and will eventually do so to the workpeople. Unhappily the operations of commerce from exterior causes are so intermittent and capricious, that the manufacturers of this country are sometimes overwhelmed with orders, and at others their machinery is but partially employed, or stands wholly idle. The consequence is, that on some occasions they are called upon to manufacture a vast quantity of goods in a short time; for if delay takes place, the market flies from them like an *ignis-fatuus*; or else they have nothing to do, and work their mills at a loss. It is then that these restrictions upon the periods of labour operate disastrously. Under ever so great a pressure, the law forbids them to allow their operatives to be employed longer than ten hours during each day, although for months previously a deficiency of trade may have prevented them from employing them at all or only in part. Thus neither the master nor the man can make up for previous losses. It is not to be wondered at, therefore, that, in times of manufacturing prosperity, means should be taken to evade the law in respect of the hours of labour. This has happened to a very considerable extent of late by resorting to what is called the 'Shift and Relay System.'

This consists of working the operatives in classes or 'relays' during the day, one gang succeeding another at stated intervals, yet each not working in each factory more than the legal number of hours; by which the manufacturers have endeavoured to keep on the safe side of the law in the face of the 26th sec. of the 7 Vic. cap. 15, which expressly states that 'the hours of work of children and young persons shall be reckoned from the time when any child or young person shall first begin to work in the morning,' &c. According to this plan, a relay of operatives may begin work at half-past five in the morning; work four hours; be idle four more; and then continue to work till half-past eight at night: making the whole number of hours, as computed by act of parliament, fifteen instead of ten. The contrivance of 'shifts,' indeed, makes the whole number actually working hours; for by that the relay is not idle, but works the 'off' four hours at another factory. By this 'shift' a combination of mill-owners get fifteen hours' work out of a given number of persons who get fifteen hours' wages. This is a virtual repeal of all the Factories' Acts.

To show how extreme the pressure for manufactured goods is on some occasions, and of what value even minutes are, we may quote from Inspector Saunders's Report:—'Statements have been made to the sub-inspectors and myself of overwork, by certain mill-occupiers running their machinery five minutes (a little more or less) over each meal hour, and in the same manner commencing work a few minutes before the meal hour had been actually completed; thus in the course of each day running the machinery from twenty to thirty minutes more than the ten hours.' The Scottish inspector mentions the case of a Paisley firm, which, by means of the Relay System—but by employing adult males only for ten hours' night-work—kept their machinery going for some time during twenty

hours per diem, the other four being occupied for meals. This was done to supply a pressing demand for the American markets. This gentleman also reports that the system of Relays is very general in Scotland, existing, in fact, in forty factories, and is perfectly satisfactory both to employers and employed. In some instances, indeed, as in the one case we have mentioned, it is, though illegal, indispensable. It does not appear that the less legitimate and proper contrivance of shifts is resorted to anywhere north of the Tweed.

The inferences to be drawn from the facts we have adduced are—1st, That when work is plentiful, and danger exists of too much labour being exacted from operatives, especially from women and persons of tender age—the factory laws now in force are everything to be desired for all parties; but that, 2dly, at times when slackness of trade is succeeded by too great an influx of it, some relaxation of the Short-Time statutes might with safety and advantage be allowed, in order to admit of both master and man making up for lost time and capital. In print-works propelled by water-power, the hardship is grievously felt; for in them the time lost by floods or drought cannot be recovered on streams that are much subject to such fluctuations; and these losses, added to the ordinary vicissitudes of trade, cause the Short-Time Acts to be felt as a serious inconvenience by calico and silk printers. The difficulties which surround the whole question are doubtless great; but it is to be hoped that the practical experience of those concerned, sifted and weighed by the government—whose constant exertions in favour of the working-classes must be warmly felt by them—will eventually bring the matter to a satisfactory adjustment.

ON THE TREATMENT OF YOUNG LADIES.

This is a most difficult subject—How to treat young ladies. If you are a married man, your course is clear enough; they regard you with perfect indifference; allow you to take your seat at their father's table without troubling themselves to criticise either your demeanour or your dress. To them you are a dummy—a monk—a monopolised individual; you are safe in their indifference, except when you officiously offer your arm to them, and so stand in the way of a younger or single man. A married man, therefore, derives at least one advantage from his double state—the advantage of being regarded by the book muslin and bare shoulders that crowd metropolitan drawing-rooms with indifference, or, may be, contempt. Let a married man presume to pester a young lady to dance with him twice in one evening, and he would be sorry to overhear her comments on him at the morrow's breakfast. A Benedict must submit to be snubbed by virgins. The truth must go forth; in the estimation of young ladies a family man is a ball-room nuisance. Leaving, then, all married men to meet virgin contempt with their best philosophy, to bear all the weight of the blame if the bachelors remain long over wine (for young ladies invariably declare that the married men detain the bachelors), let me turn to the unfettered men of England—to those epicures not yet betrothed to conjugal skirts, and who, moreover, with a moderation worthy of all honour, are content to have for a home, at some £20 per annum, one of those west-end palaces called clubs, from the contemplation of which the virgin minds of England shrink with instinctive horror. The unmarried epicure, if his wishes are bounded with the moderation to which we have referred, has a stormy path to traverse. Live and die a bachelor! Ha! ha! shout a hundred silvery voices in derision. It is no easy matter, let me tell you, my single friend. Did you hear the mocking music of that plotting hundred? Well, they have each netted a mesh in the net that is to catch you. And how will they lure you to the snare? Why, with baited smiles and dimples, and pearly rows of teeth, and scented breath, and fairy forms, and mountains of muslin, and yards of ringlets, and rarest perfumes, and crimson blushes, and whispered vows, and pouting pulpy lips. And these are snares, believe me, that count their thousands of victims, your humble servant among the number. Once defy beauty, and you must remain on guard against her for ever. You will know no cessation of hostilities—she will pursue you to the grave—therefore it is indispensable for the single epicure to enter upon life with a

tough and a stout heart; to him the dulcet accents of the virgin must ever recall the marriage bell; he must touch her hand as he would a red-hot cinder. He must be a block of ice, defying thaw, keeping at the same time in coolest places; yet must he, for the satisfaction of his stomach, so act, that he may not give offence to his host's daughters. He may not behave coldly towards them, and to treat them with marked attention would endanger his own peace of mind; the safest course, therefore, for him to pursue, is to talk seriously with their father on the subject of marriages, to say incidentally that his host's daughters will make charming wives, that, in fact, they deserve to marry into the very best families in the kingdom; and then (it must be dexterously done) let him advise their father to watch them narrowly, and to seek to ally them to titled husbands. By acting in this way, he will secure the good-will of the father, and, if the matter come to the ears of the daughters, flatter their pride, and make them turn their thoughts to coronets. He will of course have prefaced this discourse by declaring that he is not a marrying man; that, in fact, his habits are those of a confirmed bachelor; besides, he is too humble and limited in his means to provide what he considers a suitable home for a specimen of nature's masterpieces.—*Knife and Fork.*

ELECTRIC TELEGRAPH IN IRELAND.

This invention has been introduced into Ireland, and is now in operation on a portion of the Great Southern and Western Railway. 'One peculiarity of this telegraph,' says Saunders's News-Letter, 'is, that the wires usually placed upon poles are in this instance buried at a considerable depth in the ground. No person travelling on the line would suppose that such a mysterious agent as the Electric Telegraph was at all in operation. Two great advantages are gained by the adoption of this plan—namely, security from the effects of lightning and depredations. The means employed for generating the electric fluid is somewhat novel, and consists in the use of a certain salt known to chemists as chloride of calcium, being, in fact, the pure base of lime. This salt has the property of attracting sufficient moisture from the atmosphere for keeping up the supply necessary to work the telegraph, thereby entirely dispensing with the use of acids, found by all electricians so destructive to the metals employed.'

COST OF PRISON ACCOMMODATION.

The sums hitherto expended on prison buildings have in some cases been enormous. The cost is seldom less than L.100 to L.150 per prisoner (a sum sufficient for building two or three neat cottages, each able to contain a whole family); and in some instances it has been much more. A portion only (the newest) of the County Prison at York, capable of accommodating only 160 prisoners, cost L.200,000, which is more than L.1200 per prisoner—enough, if it had been desired, to build for each prisoner a separate mansion with stable and coach-house.—*Fourteenth Report of Prison-Inspectors.*

THE ZICZAC AND THE CROCODILE.

On one occasion I saw, a long way off, a large crocodile, twelve or fifteen feet long, lying asleep under a perpendicular bank, about ten feet high, on the margin of the river. I stopped the boat at some distance, and noting the place as well as I could, I took a circuit inland, and came down cautiously to the top of the bank, whence with a heavy rifle I made sure of my ugly game. I had already cut off his head in imagination, and was considering whether it should be stuffed with its mouth open or shut. I peeped over the bank; there he was, within ten feet of the rifle. I was on the point of firing at his eye, when I observed that he was attended by a bird called a ziczac. It is of the plover species, of a grayish colour, and as large as a small pigeon. The bird was walking up and down, close to the crocodile's nose. I suppose I moved, for suddenly it saw me; and instead of flying away, as any respectable bird would have done, it jumped up about a foot from the ground, screamed 'ziczac!' 'ziczac!' with all the powers of his voice, and dashed itself against the crocodile's face two or three times. The great beast started up, and immediately spying his danger, made a jump into the air; and dashing into the water with a splash which covered me with mud, he dived into the river, and disappeared. The ziczac, to my increased admiration, proud apparently of having saved his friend, remained walking up and down, uttering his cry, as I thought, with an exulting voice, and standing every now and then on the tips of his toes in a conceited manner, which made me

justly angry with his impertinence. After having waited in vain for some time to see whether the crocodile would come out again, I got up from the bank where I was lying, threw a clod of earth at the ziczac, and came back to the boat, feeling some consolation for the loss of my game in having witnessed a circumstance, the truth of which has been disputed by several writers on natural history.—*Curzon's Visits to Monasteries in the Levant.*

THE SHEPHERDESS'S CRADLE-SONG.

FROM THE GERMAN.

SLEEP, baby, sleep,
Thy father tends the sheep;
Thy mother shakes the little tree,*
Down falls a pretty dream for thee—
Sleep, baby, sleep.
Sleep, baby, sleep,
The skies are full of sheep,
Each starlet's but a little lamb,
The moon it is the lambkin's dam—
Sleep, baby, sleep.
Sleep, baby, sleep,
The Saviour tends his sheep;
Himself the gentle lamb indeed,
Who for us all was made to bleed—
Sleep, baby, sleep.
Sleep, baby, sleep,
And thou shalt have a sheep;
A sheep with golden bells so fine,
A playmate he shall be of thine—
Sleep, baby, sleep.
Sleep, baby, sleep,
And bleat not like a sheep;
Or else the shepherd's dog so wild
Will come and bite my naughty child—
Sleep, baby, sleep.
Sleep, baby, sleep—
Away and herd the sheep;
Away, thou shepherd's dog so wild,
And do not wake my darling child—
Sleep, baby, sleep.

* The cradles are suspended to the trees.

PHILOSOPHY OF HAPPINESS.

Whoever judges of things by appearance, finds that Providence has distributed his gifts in a very unequal manner. I could show that we often attribute to Heaven what is alone due to our own ignorance, but I confine myself to the affirmation that Providence has conferred on all men the conditions necessary to happiness. Seeing that we are all able to perfect and develop our faculties, we have within ourselves a prompt and facile means of obtaining interior peace, and at the same time contentment and repose in ordinary life. If, therefore, education accustomed us better than it does to live with and in ourselves, to seek in faith and confidence the pleasures of conscience, by preferring them to the deceitful and fugitive pleasures of the passions, we should find at all times, and in every condition of life, the means of satisfying our innate desire for happiness.—*Signora Ferrucci.*

CHAMBERS'S EDUCATIONAL COURSE, CLASSICAL SERIES.

This CLASSICAL SERIES, it is proper to mention, is not a mere reprint of the usual editions: every work is from carefully-collated texts of the best scholars and modern philologists, printed in a form to suit schools, and having Explanatory English Introductions and Notes, also Maps and Engravings where they appear requisite. The series is intrusted to the editorial care of Dr ZUMPT of the University of Berlin, and Dr SCHMITZ, Rector of the High School, Edinburgh. Already five works have appeared; the last, just added, being Q. CURTIUS RUFUS, DE GESTIS ALEXANDRI MAGNI, illustrated with a Map of Alexander's empire and celebrated route to India.

** The works are sold by all Booksellers.

Published by W. & R. CHAMBERS, High Street, Edinburgh. Also sold by D. CHAMBERS, 20 Argyle Street, Glasgow; W. S. ORR, 147 Strand, London; and J. M'GLASHAN, 21 D'Olier Street, Dublin.—Printed by W. & R. CHAMBERS, Edinburgh.

CHAMBERS'S EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF 'CHAMBERS'S INFORMATION FOR THE PEOPLE,' 'CHAMBERS'S EDUCATIONAL COURSE,' &c.

No. 291. NEW SERIES.

SATURDAY, JULY 28, 1849.

PRICE 1½d.

THE KOH-I-NOOR, OR MOUNTAIN OF LIGHT.

If there is one object in nature more interesting to human beings than another, it is the Diamond. Why this should be so, Philosophy might perhaps be able to tell if we consulted her; but it is not surprising that Poetry, who is always more or less inclined to superstition, should refer the influence of the stone over our judgments and imaginations to some occult talismanic power working upon us like fascination. This idea is fortified in a curious manner by a consideration of the history of the most remarkable of all diamonds, now rendered, by circumstances, an object of public curiosity and interest to both hemispheres: the celebrated gem which has been named, with Oriental extravagance, the Mountain of Light.

Some time ago Sir Charles Napier assured us in this country that it was on its way from the Punjaub to England, destined for the treasury of Queen Victoria; but a more general opinion now is, that Gholab Singh, alarmed for its safety during the Sikh convulsions, carried it off to Jamoo, and that it still remains in his possession. The whole Punjaub, however, having become a portion of our dominions, this famous historical diamond, it is to be presumed, will fall ere long to the British crown: and at anyrate our readers will probably not be displeased to have before them an account of the Koh-i-noor and its singular fortunes.

Like other subjects of history, the Koh-i-noor has its fabulous as well as authentic era; but of the former we shall only say that the diamond is believed by the Hindoos to have belonged to mythological Pandoos before it came to illumine with a fatal gleam the close of the Mogul dynasty. Although we spare the reader, however, on this point—and perhaps derogate thereby from our own character as an orthodox historian—we may at least advert to one of the omens which preceded its actual appearance. The anecdote is given by Captain Hamilton;* and although obviously wrong in chronology (the royal pair referred to having been married before their accession to the crown), it is sufficiently characteristic to be probable. Shah Jehan, he tells us, was led by his well-known love of the arts and sciences, and by his constant patronage of foreigners, into strangely-liberal notions of the rights and true social position of women. 'He was sorry,' says the captain, 'to see the most beautiful part of the creation caged in seraglios, bred up in ignorance, and kept from useful and pleasant conversation, by the heavy fetters of blind and unreasonable custom;' and the plan he took to break through the conventionalities of his court was to get up a *fancy fair*. In those days, however, the doctrine of free trade was unknown; and when the ladies on the appointed

day had established themselves in their booths, provided with jewels and trinkets for sale, the courtiers were compelled to buy at whatever prices they chose to ask, and the emperor himself was among the purchasers.

Shah Jehan, in his progress among the booths, was struck by the engaging expression of one of the sellers, and inquired what she had to dispose of; on which she told him that she had still one large rough diamond on hand, and would not object to part with it for a consideration. Hereupon she produced in a grave, business-like manner, the object in question; and the emperor, unaccustomed to that feminine freedom he had himself desired to call into existence, was no doubt much amused, as well as surprised, to find it a piece of fine transparent sugar-candy cut in the diamond form. He asked her how much she demanded; and with a pleasant air, which passed off very agreeably the pretty assurance, she replied that it was well worth a lac of rupees—£10,000! Shah Jehan gave an order for the money upon the spot; and in this way began his acquaintance with his future empress, the mother of Aurungzebe. When Ranoo died, her husband perpetuated her name by building for her one of the most remarkable mausolea in the world, the famous Taj, the construction of which, we are told by Tavernier, occupied 20,000 men for twenty-two years, and cost £3,174,802 sterling. When Colonel Sleeman visited the place with his wife, he asked her what she thought of it. 'I cannot tell you,' she replied, 'what I think, for I know not how to criticise such a building; but I can tell you what I feel: I would die to-morrow to have such another over me.*'

Aurungzebe, born of this marriage, came into the world, it may be supposed, with an air-drawn diamond glittering in his imagination; and perhaps it was his knowledge of the prodigious effect of his mother's sugar-candy which led to the introduction of the Koh-i-noor into the treasury of the Great Mogul! Shah Jehan, notwithstanding his magnificence in building—exemplified in the Taj Mahal alluded to, and in the great mosque at Delhi—had filled the coffers of the state; for the celebrated Peacock Throne, likewise his work, was not a mere extravagant bauble, but a receptacle for the jewels of the crown, with which it was incrustated. In his later years, however, unprotected by the influence of his queen, now no more, he had sunk into intemperance, and consequently disease; and on a report of his death in 1658, his four sons, as was always the fashion in India, flew to arms to scramble for the throne. But Aurungzebe made no pretensions for himself: his thoughts were fixed upon another world. He was never seen without the Koran under his arm, and never failed to say his prayers five times a day in a loud and

* Hamilton's New Account of the East Indies, from 1688 to 1723.

* Sleeman's Rambles and Recollections of an Indian Official.

melodious voice. He professed himself to be a faquir, or religious mendicant—a kind of Mohammedan friar—lived upon rice, roots, and water, and dressed in plain white, without a single jewel or other ornament. His sole object of ambition was to retire to Mecca, to spend the rest of his life in prayer near the tomb of the Prophet; and in the meantime he espoused the cause of the youngest brother, joining his army with his. But even in this union they were not a match for the other two separately, and something more remained to be done.

Aurangzebe governed the province of the Deccan, and there had formed a strict though secret alliance with a man as extraordinary as himself. This was a Persian adventurer, Ameer Jumla, who had come to Southern India as an attendant upon a merchant, and risen in the service of the king of Golconda till he became viceroy over the richest portion of the country, containing its celebrated diamond mines, and commander-in-chief of the army. His wealth was so immense, that the king at length looked upon him as a rival in the state; and Ameer Jumla, whose grand ambition was to be the founder of a royal dynasty somewhere or other, was glad to enter into a union with the Mogul prince even at a sacrifice of a portion of his prodigious fortune. As arranged between them, therefore, he repaired to the court of Shah Jehan, the report of whose death had been premature, and offered to lead an army against Golconda, and deliver up to him its boundless wealth; as a specimen of which, he presented to the dazzled emperor, not a piece of sugar-candy, but the veritable Koh-i-noor, the Mountain of Light!

The Koh-i-noor being our theme, we can spare but a few words for the human personages of the great Indian drama. Ameer Jumla was intrusted, by the avarice of the fated king—in spite of the remonstrances and intreaties of his eldest son, whom he had destined for the throne—with the army he prayed for; which he first carried against Golconda, and then added to the forces of Aurangzebe. The two eldest brothers in the meantime had met in the field, when one was worsted, and forced to fly; and Aurangzebe led his combined strength against the victor, whom he completely routed in a pitched battle. The farce of the faquir was therefore at an end. He deposed and confined his father, who still clung to the cause of the eldest of his children; and making his youngest brother drunk at an entertainment, sent him quietly off to a state prison, and mounted the imperial throne himself in 1658.

The Koh-i-noor was by this time set in the Peacock Throne, and from that proud seat looked with its large, cold, bright, uninking eye upon the approaching crisis. It witnessed the rise in a few years of the peasantry of its own Golconda and the neighbouring countries into a great power, known as the Mahratta Empire; it watched the new inundation roll over the Mogul dominions, sweeping away their political demarcations; it admired the firmness and intrepidity with which the brave, unscrupulous, and crafty Aurangzebe fought and finessed by turns, and struggled with his destiny even to extreme old age; and it read the will in which the last of the really great Moguls proclaimed in these words the vanity of human life:—'I came naked into the world, and naked I go out of it. Let no ensigns or royal pomp accompany my funeral: let a faithful servant convey my corpse to the place of Shah Zen al Din, and make a tomb for it in the simple manner of dervishes: let not my fortunate children give themselves any concern about a monument.* Long ere now the family competitors of Aurangzebe had perished; and Ameer Jumla, while planning the conversion of the government of Bengal, which had been bestowed upon

him, into an independent sovereignty—the grand ambition of his life—had died quietly in his bed. In the twelve years succeeding the emperor's death, no fewer than five other princes reigned and died successively, each leaving the Mogul empire deeper in decay. But still the Koh-i-noor continued to gaze and glitter from the Peacock Throne, till its mocking gleams were at length beheld afar off in the visions of Nadir Shah.

Nadir Shah was a soldier of fortune, who had seized upon the throne of Persia; and after conquering, as had been done more than once before, the then imperial territories of Ghizni and Cabul, he yielded to the temptations of the Koh-i-noor and the other treasures of India, and resolved to snatch a booty even from under the beard of the emperor himself at Delhi. There was nothing very surprising in this, as the riches of Mohammed Shah, the great Mogul of the time, were very dazzling to a *parvenu* king; and as the state of the acclimatised Tartars, who had gradually sunk into effeminacy, seemed to point them out as the prey of the first comer of the many enemies who were now gathering like vultures round the dying empire. Nadir advanced into India, defeated Mohammed Shah in a general engagement at Kurnaul; and then the two kings, the conqueror and conquered, proceeded together to Delhi.

Here the pretext chosen by Nadir was an insurrection of the populace; and so savage were the Persians, who had hitherto been kept down by the policy of their commander, that even the animals found in the streets and houses were not spared, far less the men, women, and children. 'As the great number of dead bodies that lay about the castle, and in the bazaars and other places, caused a very offensive stench, they pressed most of the people they met with in the streets, and employed them in removing the bodies. Some, by tying cords to the feet, they dragged without the city; some they threw into the river; and those whom they imagined to be Hindoos, they piled forty or fifty of their bodies a-top of each other, and burnt them with the timber of the demolishing buildings.* Nadir now proceeded to the main object of his inroad—robbing the treasury, and then the inhabitants individually, and torturing or slaying all who were refractory. In this manner he collected in money and plate about L.12,000,000, not including the Peacock Throne, the crown jewels, and, above all, the Koh-i-noor. This booty cost in all, according to Fraser, 200,000 lives.

On his march homewards, he distributed large sums among his soldiers; and at Herat made a display of his acquisitions, of which the following description is given by a Kashmirian writer of credit, who was an eye-witness:—'When Nadir Shah was at Delhi, he had such a profusion of jewels, that he ordered the *moabir bashy* to make up arms and harness of every kind, inlaid with precious stones, and to ornament a large tent in the same manner. For this purpose the best workmen that could be procured were employed a year and two months during the march; and when Nadir Shah arrived at Herat, the *moabir bashy* informed him that a great number of the following articles, richly inlaid with precious stones, were prepared—namely, horse harness, sword sheaths, quivers, shields, spear-cases, and maces, with *sundeels* or chairs of different sizes, and a large tent lined with jewels. The tent was ordered to be pitched in the *devan khaneh*, in which were placed the *tukht taou-see*, or Peacock Throne, brought from Delhi the *tukht nadery*, with the thrones of some other monarchs, together with the inlaid *sundeels*. Publication was made by beat of drum throughout the city and the camp, that all persons had liberty to come to this magnificent exhibition, such as had never before been seen in any age or country. Nadir Shah was not pleased with the form of the tent; and besides being lined with green satin, many of the jewels did not appear to advantage:

* Fraser's History of Nadir Shah.

* Fraser's History of Nadir Shah.

he therefore ordered it to be taken to pieces, and a new one to be made, the top of which, for the convenience of transportation, should be separate from the walls, such as in Hindoostan is called a *rowty*. When he returned to Meshed from his expedition into Turan, this new tent being finished, was displayed in the same manner as the former one; but its beauty and magnificence are beyond description. The outside was covered with fine scarlet broadcloth, the lining was of violet-coloured satin, upon which were representations of all the birds and beasts in the creation, with trees and flowers, the whole made of pearls, diamonds, rubies, emeralds, amethysts, and other precious stones; and the tent poles were decorated in like manner. On both sides of the Peacock Throne was a screen, upon which were the figures of two angels in precious stones. The roof of the tent consisted of seven pieces; and when it was transported to any place, two of these pieces packed in cotton were put into a wooden chest, two of which were a sufficient load for an elephant; and the screen filled another chest. The walls of the tent, the tent poles, and the tent pins, which latter were of massy gold, loaded five more elephants; so that for the carriage of the whole were required seven elephants. This magnificent tent was displayed on all festivals in the dewan khaneh at Herat during the remainder of Nadir Shah's reign. After his death, his nephew, Adil Shah, and his grandson, Shahrokh, whose territories were very limited, and expenses enormous, had the tent taken to pieces, and dissipated the produce.*

The monster Nadir is represented by the same writer as having been tall, with a beautiful complexion of red and white, and a fine animated countenance. Fraser reports, from one who knew him, that he was upwards of six feet high, well proportioned, of robust make and constitution, with an inclination to be fat, counteracted by the fatigue he constantly underwent. His diet was simple, his wine of moderate quantity; and even these indulgences gave way, when necessary to business, the king satisfying his hunger rather than his appetite with a few parched peas, which he always carried in his pocket, and a draught of water. He was extremely generous, but yet a strict man of business, and a fierce disciplinarian, punishing offences with death or mutilation without mercy. In the evening, he was accustomed to unbend freely with a few chosen companions; but on one occasion two of them chancing to address him the next day, as if remembering their intimacy, he caused them instantly to be strangled.

Nadir now proceeded from conquest to conquest, becoming more cruel every day, and unluckily, according to honest Khojeh Abdulkurreem, neglecting those prayers and prostrations which had given success to his former cruelties. He now rarely prayed at all, and yet continued to indulge himself as usual in depriving his friends of their eyes or lives on the most trifling pretences; till at length his 'imprudence' in this particular ended in his forming a design for a wholesale massacre of his Persian troops by the Affghans and Uzbecks, whom he preferred. This was a little too much. A cabal was formed against him; and one morning the body of Nadir Shah was found in his tent, with the head cut off, and an old woman lamenting over it. The Koh-i-noor was not a witness of this tragedy: it had been previously sent off with the other diamonds to Kelat; and when the successor of Nadir mounted the throne, he found himself the possessor of £10,000,000 in money, besides gold and silver bullion, and the Peacock Throne.

This prince, however, was not allowed to preserve long either the diamond or his own eyes. His rebellious subjects deprived him of the latter; and Ahmed Shah, the commander of Nadir's Affghan cavalry, who had thought fit, in the confusion of the time, to make himself a king in Affghanistan, relieved the blind man of

the charge of the Koh-i-noor. This fatal gem may be thought to have acted like a talisman upon its possessor. He first wrested the Punjaub from India, and then, by an uncontrollable impulse, threw himself headlong into the *mêlée*, when the Mogul empire, convulsed with its last throes, was in the death-gripes with the Mahrattas. At Paniput, within fifty miles of Delhi, in the year 1761, the battle was fought which decided the fate of all parties. The Mahrattas were beaten and dispersed; Ahmed Shah returned to his own dominions, after having assisted at the slaughter of 200,000 men; and the empire, already mortally struck, fell to pieces, and made way for a company of foreign merchants, to raise an English sovereignty upon its ruins.

The Koh-i-noor remained at Cabul, emitting its sardonic gleams over the vicissitudes of the Affghan monarchy. The third in succession from Ahmed—for reigns are short in such times and countries—was driven from his throne by a younger brother, and taking refuge with his diamond in a distant castle, found himself there in confinement. He hid the Koh-i-noor in a crevice in the wall; and even when betrayed into the hands of his brother, and blinded by his orders, he refused to discover the treasure, affirming that he had thrown it into the river as he crossed. The third and youngest brother of this amiable family—well known to our readers as the Shah Shoojah—now set both the others aside, mounted the throne himself, and endeavoured to satisfy poetical justice by blowing from the mouths of cannon the treacherous castellan and his wife and children! In gratitude for this vengeance, the blind brother disclosed to Shoojah the place where the diamond was concealed: and when the latter was soon after compelled to fly into the Company's territories, he carried with him the Koh-i-noor. The Affghan portion of this narrative we take from Colonel Sleeman, who received it from the old blind king himself.

When Shoojah and the Koh-i-noor arrived at Lahore on their way to the Company's territories, they were at first received with great distinction by Runjeet Singh; but this did not last long. If the royal fugitive had left the diamond in the wall, he might have passed on in peace; but Runjeet felt as powerfully as any of the others who had been exposed to it that spectral gleam which, like some fatal meteor, had always been the herald of strife and disaster. The Koh-i-noor, in fact, even before its recorded history commences, had perhaps *always* been the object of violence and robbery. In Golconda, as we are informed by the Venetian traveller Marco Polo, the richest diamonds were obtained from a small valley so completely surrounded by inaccessible rocks, that it afforded no approach for human beings. It was the custom of the people, therefore, to throw large pieces of meat over the cliffs, and when the white eagles of the region darted down upon the prey, to pursue them to their retreats, and in their turn rend away the spoil. Adhering to the meat, they found diamonds of great value. This, for aught we know, may be a fiction; but the story is repeated in the 'Arabian Nights,' and was the faith of all Asia.

The unlucky Shoojah was offered a territory and a fort, and all sorts of things, for the diamond; but he denied that he had it in his possession, and his wife, drawing upon her feminine imagination, declared that it had been pawned for supplies. 'Runjeet, disbelieving these assertions, placed guards round the Shah's residence, and allowed no access or egress without strict search. The exiled family, however, being proof against the severity of mere restraint, the prohibition of food was added, and for two days the shah, with his wives, family, and servants, suffered absolute deprivation; but their firmness was even proof against this trial; and Runjeet, from a regard to his own reputation, determined to proceed with more art, and ordered food to be supplied.' A letter was now forged, implicating Shoojah in some correspondence with Runjeet's enemies; and it 'was now assumed to be indispensable to take precautions against the intrigues and machinations of the

* Memoirs of Khojeh Abdulkurreem. Translated from the Persian by Francis Gladwin.

shah; and a guard of two companies of Sikhs, from the newly-raised corps, being added to that previously set over the premises where he resided, threats of a transfer of the shah's person to Govindgurh, with treatment of the most galling and injurious kind, were resorted to, in order to enforce compliance with the demand for the jewel. Having tried remonstrance in vain, the shah next resorted to artifice, and solicited two months' delay, to enable him to procure the diamond from certain *mahajuns* with whom it was asserted to be pledged, and he said that some lacs of rupees must be expended to effect this. Runjeet reluctantly consented to allow the time solicited, and severities were accordingly suspended for a season. They were renewed, however, before the period expired; and Shah Shoojah, wearied out by them, and seeing that the rapacity of the Sikh would not hesitate, even at the sacrifice of his life for its gratification, agreed at last to give up the precious jewel. Accordingly, on the 1st of June, Runjeet waited on the shah, with a few attendants, to receive it. He was received by the exiled prince with much dignity, and both being seated, a pause and solemn silence ensued, which continued for nearly an hour. Runjeet then, getting impatient, whispered to one of his attendants to remind the shah of the object of his coming. No answer was returned, but the shah with his eyes made the signal to a eunuch, who retired, and brought in a small roll, which he set down on the carpet at an equal distance between the chiefs. Runjeet desired Bhoonnee Das to unfold the roll, when the diamond was exhibited and recognised, and the Sikh immediately retired with his prize in hand.* Runjeet, however, was enraged with Shoojah for having kept him so long from the object of his desire, and another attempt was made to implicate him in political intrigues. According to the anonymous author above quoted, however, he was finally permitted to purchase his liberty with L.2000; but another writer says that he made his escape only by climbing over the roofs of some houses, and creeping under the walls of the city through a sewer.† Runjeet remained in possession of the diamond till his death, and by his last will bequeathed it to the temple of Juggernaut; but although the other bequests of the dead Lion of the Punjab were carefully attended to, his successors disregarded this one, and the Koh-i-noor remained in the royal treasury. Since then, it continued to glare steadily upon the distractions of the country, till all on a sudden it disappeared.

It cannot, however, remain long in obscurity. Before these sentences see the light, it will in all probability have been discovered, and have returned, after passing through so many strange adventures, into the hands of the Masters of India.

Having now brought our historical narrative to a close, we must proceed, after the manner of our betters, to give some account of the appearance, character, and value of our subject. The Koh-i-noor, like many other great personages of history, is not indebted much to external form. It is not cut so as to sparkle like a brilliant, but returns the beholder's gaze with a cold, steady glare, fit to make a nervous man wink. It is plainly set in gold. With regard to its pecuniary value, the common superstition is, that it is worth L.3,500,000 sterling; but this will not stand the test of figures for an instant. The professional mode of estimating the value of a diamond is to square the number of carats it weighs, and then to multiply the product by the price of a single carat. Thus a rough diamond of eight carats' weight, at L.2 for one carat, is worth L.128, the arithmetical process standing thus: $8 \times 8 \times 2 = 128$. But although a rough diamond is estimated at L.2, when cut brilliant-fashion the price is L.8, and rose or table-fashion L.6. The carat, let us further premise, is four grains diamond weight, which is equivalent to 3.174 grains Troy.

Now our diamond, though said, when in the rough state, to have weighed 900 carats, has been diminished by cutting and polishing to 279, and not being shaped as a brilliant, its price must be based upon L.6 for one carat. This, by the rule above stated, would give L.467,000—a splendid sum, no doubt, but not a seventh part of the commonly-assigned value. A similar exaggeration is current as to the value of the great diamond of the Emperor of Russia, a splendid stone which we had once the honour of gazing at in the Kremlin at Moscow. It is said to be worth L.4,804,000; whereas, taking it at the most favourable estimate, it would not come to more than L.264,200. But the truth is, the rule we have given is rarely extended to stones of more than 20 carats, after which weight the valuation is arbitrary. The Empress Catharine is said to have given for the Russian diamond L.90,000 in ready money, and an annuity of L.4000; and our diamond, we say, is worth—just as much as it will fetch. We have only to add, that the Koh-i-noor is the second largest diamond in the world; that of the Rajah of Mattan, found in Borneo, weighing 367 carats. As for the Brazil stone of 1680 carats, it is supposed to be nothing more than a colourless topaz.

L. R.

THE PROGRESS OF PENNY POSTAGE.

A SET of tabular returns has recently been issued by order of parliament, which will afford some curious and interesting information respecting the Post-Office to those whose patience and arithmetical powers are equal to the task of extracting it. These tables exhibit a history of the Penny Postage: the first shows the number of chargeable letters which have passed through the London General Post, inwards and outwards, since the first reduction of postage from distance-rates to the uniform rate of fourpence, which happened on the 5th December 1839, to the beginning of the present year, dividing the time into periods of four complete weeks each. This of course takes in the whole period of the Penny Postage, which was commenced on 10th January 1840. That a means of comparison may be afforded, there is shown on the same page the estimated average number of letters for the four weeks immediately preceding the introduction of uniform rates.

The conservative character of our nation, and the tardiness with which we avail ourselves of anything that is new, even though highly beneficial, is strikingly shown in this document. It appears to have taken eight years for the public to find out the advantages of Penny Postage; and even now, it is by no means clear that these are as extensively appreciated as they will be. The number of letters passing through the General Post-Office to and from London, and every other part of the world, has, it is true, increased in the eight years above eightfold; but the increase has been curiously slow and gradual. In 1839, the estimated average number of letters per lunar month was 1,622,147: in the first four complete weeks noted in these returns as having elapsed after the Penny Post began—namely, from the 1st to the 29th February 1840—the number little more than doubled, being 3,338,074. From this point the augmentation goes on in progressive numbers with extraordinary stealthiness, as is seen by running the eye down the column of totals, where we find the initial figures representing millions mounting up by units, at almost regular intervals of time, to 9,268,457, which is given as the total number of letters which passed through the London General Post-Office during the four weeks ending on the 17th February 1849.

To show the influence of cheapness on the amount of public correspondence, we need only adduce the returns

* History of the Punjab. London: Allen.

† Fane's Five Years in India.

respecting the district or local post of London. Up to 1840, when the tax was twopence per letter 'on the stones'—as the inner circle of the metropolis was then called—and threepence 'off the stones,' or to the extremity of the outer circle or suburbs, the estimated average number of letters for four weeks was two-thirds as many as that which passed through the London Post-Office to and from the rest of the world. In other words, in 1839 the average local correspondence of London occasioned the passage through the post of 1,021,386 epistles per *mensum*; while for its provincial and foreign correspondence, with the excessive distances then enacted, the number was no more than, as before stated, 1,622,147 per month during that year. Another singular revelation tending to show the influence of cheapness may be discovered in studying these returns; for it would appear from them that the increase in the public interchange of letters through London has been in almost exact proportion to the decrease in the charges for transmitting them. Thus, as we find the reduction for the London district post was from an average of twopence and a fraction to one penny, so we also find that the number of letters has more than doubled; being—instead of 1,021,386, as in 1839—2,601,951 for the month ending the 20th January in the present year. We have also already seen that the increase in the number of London General Post letters has been above eightfold; and eightpence was about the average per letter charged under the old system.

Although London, being the great mart and centre of the empire, would appear to present a matter of this kind in its most magnified aspect, yet if we turn to another table, which includes, besides the London, the local district, and cross posts of the English provinces, Ireland, Wales, and Scotland, the ratio of increase in public correspondence occasioned by the Penny Postage which we have named is not overstated, even when applied to the whole of the United Kingdom. We glean from a comparative statement of the number of letters *delivered* in one week of each calendar month, beginning with November 1839, and ending with the present time (20th March 1849), that during the week terminating with the 24th November 1839, there were delivered in the United Kingdom 1,585,973 letters. That was under the old rates of charge. In the week that ended on the 21st of last February, the number was 6,849,196. This is an increase of more than five million letters per week, *delivered* at a penny each, to which must be added, to make up an approximation of our former estimate, letters *sent* to the colonies and to foreign parts, and those misdirected, or, from other causes, not delivered at all, and destroyed in the Dead-Letter Office. As a matter of curiosity, we may add, that the number of letters which was delivered in the United Kingdom in the year 1848 was about 328,000,000, and the number which passed through the London General and District Post-Offices during the same year was something over 144,000,000!

When Mr Rowland Hill first proposed the uniform Penny Rate, one of his calculations—in the correctness of which the public found it most difficult to place faith—was that which prognosticated that in time the gross revenue of the Post-Office would be as great under his cheap as it then was under the dear system. That calculation is now very nearly verified in accounts returned three or four weeks ago to an order of the House of Commons. The gross sum paid for postage by the public in the official year ending 5th January 1838 was L.2,339,737, and their contributions of pennies in 1848 amounted to a sum not very far short—namely, to L.2,192,478. Neither has the cost of management kept pace with the eightfold accession of business, for that has not quite doubled. In 1838 it was L.687,313, and in 1848 it was L.1,386,853. It is, however, well known that Mr Rowland Hill has met with much official resistance to his plans of economy; and that were they fully carried out, the cost of the establishment would be so

materially diminished, as to be brought much nearer the former expenditure than it remains at present. The new regulation, forbidding the reception of unstamped paid letters, will relieve the Post-Office of much expense and trouble. The public were not sufficiently aware that the effect of paying a penny with a letter, instead of putting a stamp on it, was to help in occasioning some half-dozen unnecessary entries on postmasters' bills, cash accounts, &c. in its transit to its destination.

Although the expenses of the Post-Office department have doubled, yet the net revenue or profit accruing to the treasury has not been diminished in like proportion. The net revenue in 1837-8 was L.1,652,424; in 1848-9 it was L.740,429. There is no doubt, however, that when all the obstacles which have been thrown in the way of Mr Rowland Hill's plans have been removed, and his plans efficiently carried out—together with such improvements in them as have been suggested by his own practical experience in office, and by his colleagues—the Post-Office will become a source of revenue as great, if not greater, than it ever was.

Not the least benefit which the Penny Post has conferred, is the facility it has created for the transmission of small sums of money. The progress of the Money-Order Office has been commensurate with that of the other branches of the vast establishment. In the three months which ended on the 5th April 1839—when the old system was in force, and when a commission of 6d. was charged for transmitting L.2 and under, and 1s. for over that sum up to L.5, besides the postage of the money order itself, which was from London to Edinburgh 1s. 1½d.—the number of money orders issued in England was 54,623 for various sums, amounting in all to L.92,734. Now each order costs only 3d. or 6d., and one penny for transmission; consequently in the quarter which ended on the 5th of January 1849, the number of money orders issued was 1,775,783 for sums amounting in all to L.3,544,250, 19s. 11d. During the whole year, L.16,303,781 passed through the Money-Order Offices of the United Kingdom!

The uniform Penny-Postage rate is no longer, then, an experiment, but a fact achieved; and achieved against an amount of official resistance and lukewarmness which would assuredly have discouraged and appalled a less energetic and well-balanced mind than, happily for this country, that which Mr Rowland Hill possesses.

LYELL'S SECOND VISIT TO THE UNITED STATES.

SECOND NOTICE.

In going southwards, Sir Charles has frequent occasion to speak of the 'domestic institution' which is the great bone of contention in the States. He of course greatly laments the existence of slavery, nor does he conceal its more odious and dangerous features; but we should infer that he considers the proceedings of the Abolitionists as not always warranted by good-feeling or sound policy. It seems at least certain that the uncompromising violence of the Northerners has greatly offended the Southerners, and contributed in no small degree to perpetuate the very evils which it was wished to eradicate. Many Southern planters would gladly liberate and dismiss their slaves, if they could be assured of having their fields cultivated at a reasonable expense by free labour. An intelligent Louisianian, conversing with our author, observed that emancipation 'must be the work of time; the prejudices of owners have to be overcome, and the sugar and cotton crop is easily lost, if not taken in at once when ripe—the canes being damaged by a slight frost, and the cotton requiring to be picked dry as soon as mature,

and being ruined by rain. Very lately a planter, five miles below New Orleans, having resolved to dispense with slave labour, hired 100 Irish and German emigrants at very high wages. In the middle of the harvest they all struck for double pay. No others were to be had, and it was impossible to purchase slaves in a few days. In that short time he lost produce to the value of 10,000 dollars.' Notwithstanding this unfortunate attempt, it could be demonstrated that free labour, in general circumstances, is greatly more profitable and satisfactory than the employment of slaves, who must not only be bought, but supported in childhood and old age. The author mentions a case in which free settlers completely outstripped their slaveholding neighbours only by their more active industrious habits. It is pleasing to know that whenever free negroes are allowed fair-play, they manifest a disposition to improve. Various instances are mentioned of able coloured preachers, and many of this unjustly-persecuted race are making fortunes in trade. 'One of them, by standing security for a white man, had lately lost no less than 17,000 dollars, or 3400 guineas; yet he was still prospering, and kept a store, and being a free man, would willingly have sent his son to the college of Tuscaloosa, had he not been prevented by the prejudices of a white aristocracy, ostentatiously boastful of its love of equality. In consequence of similar impediments, many thriving artisans of the coloured race remain uneducated, and are obliged to have white men to write for them and collect their debts; and I found that many cabinetmakers, carpenters, builders, and other mechanics earning high wages, who in New England would send their sons to college, do not contribute here even to the maintenance of common schools, their children not being permitted by law to learn to read and write. I cannot believe, however, that this state of things can endure many years.'

We are presented with some amusing anecdotes of electioneering. In some parts of the country there is the strongest indisposition to elect wealthy men to office, in consequence of a belief that they would not be sufficiently subservient. 'One who had for some time held a seat in the legislature, finding himself in a new canvass deserted by many of his former supporters, observed that he had always voted strictly according to his instructions. "Do you think," answered a former partisan, "that they would vote for you, after your daughter came to the ball in them fixings?"' His daughter, in fact, having been at Mobile, had had a dress made there with *flounces* according to the newest Parisian fashion; and she had thus sided, as it were, with the aristocracy of the city, setting itself up above the democracy of the pine woods. In the new settlements there the small proprietors, or farmers, are keenly jealous of thriving lawyers, merchants, and capitalists. One of the candidates for a county in Alabama confessed to me that he had thought it good policy to go everywhere on foot when soliciting votes, though he could have commanded a horse, and the distances were great.' The doctrine of political equality appears to have been carried on one occasion to a remarkable length. Natchez, a populous and commodiously-situated town, was decided to be no longer a metropolis, from being discovered to be several miles away from the centre of the state. A search for the true centre being ordered, it was found to be a spot in the middle of a swamp, accessible only by a canoe. 'This was welcome news; all might now be placed on a footing of equality, the spot being equally inaccessible and inconvenient for all. When the architect, however, came to build the Capitol, he took the liberty, instead of erecting the edifice on piles in the centre of the swamp, to place it on an adjoining rising ground, from which they had cleared away the native wood—a serious

abandonment of principle, as it was several hundred yards from the true geographical centre.' We hope our American friends can laugh as heartily at this as we do.

At New Orleans, Sir Charles was struck with the difference between the English and French quarters of the town, as well as the dissimilarity existing between the Anglo-American and French-American character. In the First Municipality, you would almost consider yourself in Paris; in the second, all is English and go-ahead. It seems that here, as elsewhere, the tendency of French society is to stand still. How strange the following circumstance:—'Hearing that a guide-book of New Orleans had been published, we wished to purchase a copy, although it was of somewhat ancient date for a city of rapid growth. The bookseller said that we must wait till he received some more copies from New York, for it appears that the printing even of books of local interest is done by presses 2000 miles distant. Their law reports are not printed here, and there is only one newspaper in the First Municipality, which I was told as very characteristic of the French race; for, in the Second Municipality, although so much newer, the Anglo-Americans have, during the last ten years, started ten newspapers.'

On going up the Mississippi, the author makes similar remarks on the comparative backwardness of the French settlers. 'My attention was next called to the old-fashioned make of the French ploughs. "On this river, as on the St Lawrence," said an American, "the French had a fair start of us by more than a century. They obtained possession of all the richest lands, yet are now fairly distanced in the race. When they get into debt, and sell a farm on the highest land next the levee, they do not migrate to a new region farther west, but fall back somewhere into the low grounds near the swamp. There they retain all their antiquated usages, seeming to hate innovation. To this day they remain rooted in those parts of Louisiana where the mother country first planted her two colonies two centuries ago, and they have never swarmed off, or founded a single new settlement. They never set up a steam-engine for their sugar-mills, have taken no part in the improvement of steam navigation, and when a railway was proposed in Opelousas, they opposed it, because they feared it would 'let the Yankees in upon them.' When a rich proprietor was asked why he did not send his boy to college, he replied, 'Because it would cost me 450 dollars a year, and I shall be able to leave my son three more negroes when I die, by not incurring that expense.'" Dr Carpenter informed me that the legislature of Louisiana granted, in 1834, a charter for a medical college in the Second Municipality, which now, in the year 1846, numbers 100 students, and is about to become the medical department of a new university. The Creoles were so far stimulated by this example, as to apply also for a charter for a French college in the First Municipality. It was granted in the same year, but has remained a dead letter to this day.'

As might have been anticipated, this 'Visit' has not been unproductive in a geological point of view. Besides corroborating certain opinions formerly advanced in reference to the occurrence of gypseous strata in connection with the Coal measures of Nova Scotia, the comparatively recent emergence of the North American continent from the waters of the ocean, new evidences of the glacial or drift period, the existence of air-breathing reptiles during the Coal era, and other facts of importance, Sir Charles is now satisfied that the coal-field of Richmond in Virginia belongs to the Oolitic period. The data upon which this opinion rests are stated with his usual accuracy and minuteness, and must now be admitted as one of the great truths of the science. That coal beds (in one instance forty feet thick) should have been formed at so recent a period as that of the English oolite, is certainly a startling fact to those geologists who regard each formation as creative distinct efforts, and that nature never, as it were, repeats herself. All

the hypotheses formerly advanced to account for the formation of coal, such as an excessive temperature, an atmosphere surcharged with carbonic acid, and the like, must now be in a great measure abandoned as mere fancies; and we must return to the wider, but more sober notion, that the creative energies of nature are inexhaustible, and that there is no phenomenon connected with the past which it is not in the power of the present or of the future again to unfold.

Sir Charles also made some extensive investigations with respect to the delta of the Mississippi, and the changes effected on the banks of the river by alterations in the course of the stream. The Mississippi occasionally overflows its usual channel, and forms inland lakes, which, strange to say, sometimes acquire a rich vegetable surface. In the preceding paper, we noticed the discovery of ice as a substratum; but it will seem not less remarkable that lakes are found beneath pastoral meadows. 'A curious description was given me by one of my fellow-travellers of that same low country, especially the region called Attakapas. It contains, he said, wide "quaking prairies," where cattle are pastured, and where you may fancy yourself far inland. Yet, if you pierce anywhere through the turf to the depth of two feet, you find sea-fish swimming about, which make their way in search of food under the superficial sward, from the Gulf of Mexico, through subterranean watery channels.'

For a large amount of original and highly-valuable information respecting the geological features of the Northern States we must necessarily refer to the work before us, which in all its details is the production of a gentleman and a scholar. We would, however, add, that it is still more remarkable for the honest explicitness of the writer's sentiments on matters usually the subject of controversy. Alluding to recent discoveries of vast organic remains and fossil foot-prints of animals, inferring a prodigious antiquity in our planet, Sir Charles speaks of that 'moral phenomenon,' the persecution of men of science in Pennsylvania for daring to propound undeniable truths to the world. 'Goldsmith, in the "Vicar of Wakefield," makes his traveller say, that after he had walked through Europe, and examined mankind nearly, he found that it is not the forms of government, whether they be monarchies or commonwealths, that determine the amount of liberty enjoyed by individuals, but that "riches in general are in every country another name for freedom." I agree with Goldsmith that the forms of government are not alone sufficient to secure freedom—they are but means to an end. Here we have in Pennsylvania a free press, a widely-extended suffrage, and the most perfect religious toleration—nay, more than toleration, all the various sects enjoying political equality, and, what is more rare, an equality of social rank; yet all this machinery is not capable, as we have seen, of securing even so much of intellectual freedom as shall enable a student of nature to discuss freely the philosophical questions which the progress of science brings naturally before him. He cannot even announce with impunity results which half a century of observation and reasoning has confirmed by evidence little short of mathematical demonstration. But can riches, as Goldsmith suggests, secure intellectual liberty? No doubt they can protect the few who possess them from pecuniary penalties, when they profess unpopular doctrines; but to enable a man to think, he must be allowed to communicate freely his thoughts to others. Until they have been brought into the daylight and discussed, they will never be clear even to himself. They must be warmed by the sympathy of kindred minds, and stimulated by the heat of controversy, or they will never be fully developed, and made to ripen and fructify. . . . "To nothing but error," says a popular writer of our times (T. Carlyle), "can any truth be dangerous; and I know not," he exclaims, "where else there is seen so altogether tragical a spectacle, as that religion should be found standing in the highways, to say, 'Let no man learn the simplest laws

of the universe, lest they mislearn the highest. In the name of God the Maker, who said, and hourly yet says, *Let there be light*, we command that you continue in darkness!'"

RECOLLECTIONS OF A POLICE-OFFICER.

A LITTLE more than a year after the period when adverse circumstances—chiefly the result of my own reckless follies—compelled me to enter the ranks of the metropolitan police, as the sole means left me of procuring food and raiment, the attention of one of the principal chiefs of the force was attracted towards me by the ingenuity and boldness which I was supposed to have manifested in hitting upon and unravelling a clue which ultimately led to the detection and punishment of the perpetrators of an artistically-contrived fraud upon an eminent tradesman of the west end of London. The chief sent for me; and after a somewhat lengthened conversation, not only expressed approbation of my conduct in the particular matter under discussion, but hinted that he might shortly need my services in other affairs requiring intelligence and resolution.

'I think I have met you before,' he remarked with a meaning smile on dismissing me, 'when you occupied a different position from your present one? Do not alarm yourself: I have no wish to pry unnecessarily into other men's secrets. Waters is a name common enough in *all* ranks of society, and I may, you know'—here the cold smile deepened in ironical expression—'be mistaken. At all events, the testimony of the gentleman whose recommendation obtained you admission to the force—I have looked into the matter since I heard of your behaviour in the late business—is a sufficient guarantee that nothing more serious than imprudence and folly can be laid to your charge. I have neither right nor inclination to inquire further. To-morrow, in all probability, I shall send for you.'

I came to the conclusion, as I walked homewards, that the chief's intimation of having previously met me in another sphere of life was a random and unfounded one, as I had seldom visited London in my prosperous days, and still more rarely mingled in its society. My wife, however, to whom I of course related the substance of the conversation, reminded me that he had once been at Doncaster during the races; and suggested that he might possibly have seen and noticed me there. This was a sufficiently probable explanation of the hint; but whether the correct one or not, I cannot decide, as he never afterwards alluded to the subject, and I had not the slightest wish to renew it.

Three days elapsed before I received the expected summons. On waiting on him, I was agreeably startled to find that I was to be at once employed on a mission which the most sagacious and experienced of detective-officers would have felt honoured to undertake.

'Here is a written description of the persons of this gang of blacklegs, swindlers, and forgers,' concluded the commissioner, summing up his instructions. 'It will be your object to discover their private haunts, and secure legal evidence of their nefarious practices. We have been hitherto baffled, principally, I think, through the too hasty zeal of the officers employed: you must especially avoid that error. They are practised scoundrels; and it will require considerable patience, as well as acumen, to unkennel and bring them to justice. One of their more recent victims is young Mr Merton, son, by a former marriage, of the Dowager Lady Everton.*

* The names mentioned in this narrative are, for obvious reasons, fictitious.

Her ladyship has applied to us for assistance in extricating him from the toils in which he is meshed. You will call on her at five o'clock this afternoon—in plain clothes of course—and obtain whatever information on the subject she may be able to afford. Remember to communicate *directly* with me; and any assistance you may require shall be promptly rendered.' With these, and a few other minor directions, needless to recapitulate, I was dismissed to a task which, difficult and possibly perilous as it might prove, I hailed as a delightful relief from the wearing monotony and dull routine of ordinary duty.

I hastened home; and after dressing with great care—the best part of my wardrobe had been fortunately saved by Emily from the wreck of my fortunes—I proceeded to Lady Everton's mansion. I was immediately marshalled to the drawing-room, where I found her ladyship and her daughter—a beautiful, fairy-looking girl—awaiting my arrival. Lady Everton appeared greatly surprised at my appearance, differing, as I dare say it altogether did, from her abstract idea of a policeman, however attired or disguised; and it was not till she had perused the note of which I was the bearer, that her haughty and incredulous stare became mitigated to a glance of lofty condescending civility.

'Be seated, Mr Waters,' said her ladyship, waving me to a chair. 'This note informs me that you have been selected for the duty of endeavouring to extricate my son from the perilous entanglements in which he has unhappily involved himself.'

I was about to reply—for I was silly enough to feel somewhat nettled at the noble lady's haughtiness of manner—that I was engaged in the public service of extirpating a gang of swindlers with whom her son had involved himself, and was there to procure from her ladyship any information she might be possessed of likely to forward so desirable a result; but fortunately the remembrance of my actual position, spite of my gentleman's attire, flashed vividly upon my mind; and instead of permitting my glib tongue to wag irreverently in the presence of a right honourable, I bowed with deferential acquiescence.

Her ladyship proceeded, and I in substance obtained the following information:—

Mr Charles Merton, during the few months which had elapsed since the attainment of his majority, had very literally 'fallen amongst thieves.' A passion for gambling seemed to have taken entire possession of his being; and almost every day, as well as night, of his haggard and feverish life was passed at play. A run of ill-luck, according to his own belief—but in very truth a run of downright robbery—had set in against him, and he had not only dissipated all the ready money which he had inherited, and the large sums which the foolish indulgence of his lady-mother had supplied him with, but had involved himself in bonds, bills, and other obligations to a frightful amount. The principal agent in effecting this ruin was one Sandford—a man of fashionable and dashing exterior, and the presiding spirit of the knot of desperadoes whom I was commissioned to hunt out. Strange to say, Mr Merton had the blindest reliance upon this man's honour; and even now—tricked, despoiled as he had been by him and his gang—relied upon his counsel and assistance for escape from the desperate position in which he was involved. The Everton estates had passed, in default of male issue, to a distant relative of the late lord; so that ruin, absolute and irremediable, stared both the wretched dupe and his relatives in the face. Lady Everton's jointure was

not a very large one, and her son had been permitted to squander sums which should have been devoted to the discharge of claims which were now pressed harshly against her.

I listened with the deepest interest to Lady Everton's narrative. Repeatedly during the course of it, as she incidentally alluded to the manners and appearance of Sandford, who had been introduced by Mr Merton to his mother and sister, a suspicion, which the police papers had first awakened, that the gentleman in question was an old acquaintance of my own, and one, moreover, whose favours I was extremely desirous to return in kind, flashed with increased conviction across my mind. This surmise I of course kept to myself; and after emphatically cautioning the ladies to keep our proceedings a profound secret from Mr Merton, I took my leave, amply provided with the resources requisite for carrying into effect the scheme which I had resolved upon. I also arranged that, instead of waiting personally on her ladyship, which might excite observation and suspicion, I should report progress by letter through the post.

'If it *should* be he!' thought I, as I emerged into the street. The bare suspicion had sent the blood through my veins with furious violence. 'If this Sandford be, as I suspect, that villain Cardon, success will indeed be triumph—victory! Lady Everton need not in that case seek to animate my zeal by promises of money recompense. A blighted existence, a young and gentle wife by his means cast down from opulence to sordid penury, would stimulate the dullest craven that ever crawled the earth to energy and action. Pray Heaven my suspicion prove correct; and then, oh mine enemy, look well to yourself, for the avenger is at your heels!'

Sandford, I had been instructed, was usually present at the Italian Opera during the ballet: the box he generally occupied was designated in the memoranda of the police: and as I saw by the bills that a very successful piece was to be performed that evening, I determined on being present.

I entered the house a few minutes past ten o'clock, just after the commencement of the ballet, and looked eagerly round. The box in which I was instructed to seek my man was empty. The momentary disappointment was soon repaid. Five minutes had not elapsed when Cardon, looking more insolently-triumphant than ever, entered arm-in-arm with a pale aristocratic-looking young man, whom I had no difficulty, from his striking resemblance to a portrait in Lady Everton's drawing-room, in deciding to be Mr Merton. My course of action was at once determined on. Pausing only to master the emotion which the sight of the glittering reptile in whose poisonous folds I had been involved and crushed inspired, I passed to the opposite side of the house, and boldly entered the box. Cardon's back was towards me, and I tapped him lightly on the shoulder. He turned quickly round; and if a basilisk had confronted him, he could scarcely have exhibited greater terror and surprise. My aspect, nevertheless, was studiously bland and conciliating, and my outstretched hand seemed to invite a renewal of our old friendship.

'Waters!' he at last stammered, feebly accepting my proffered grasp—'who would have thought of meeting you here?'

'Not you, certainly, since you stare at an old friend as if he were some frightful goblin about to swallow you. Really?—'

'Hush! Let us speak together in the lobby. An old friend,' he added in answer to Mr Merton's surprised stare. 'We will return in an instant.'

'Why, what is all this, Waters?' said Cardon, recovering his wonted *sang froid* the instant we were alone. 'I understood you had retired from amongst us; were in fact—what shall I say?—'

'Ruined—done up! Nobody should know that better than you.'

'My good fellow, you do not imagine'—

'I imagine nothing, my dear Cardon. I was very thoroughly done—done *brown*, as it is written in the vulgar tongue. But fortunately my kind old uncle'—

'Passgrove is dead!' interrupted my old acquaintance, eagerly jumping to a conclusion, 'and you are his heir! I congratulate you, my dear fellow. This is indeed a charming "reverse of circumstances."'

'Yes; but mind I have given up the old game. No more dice-devilry for me. I have promised Emily never even to touch a card again.'

The cold, hard eye of the incarnate fiend—he was little else—gleamed mockingly as these 'good intentions' of a practised gamester fell upon his ear; but he only replied, 'Very good; quite right, my dear boy. But come, let me introduce you to Mr Merton, a highly-connected personage I assure you. By the by, Waters,' he added in a caressing, confidential tone, 'my name, for family and other reasons, which I will hereafter explain to you, is for the present Sandford.'

'Sandford!'

'Yes: do not forget. But *allons*, or the ballet will be over.'

I was introduced in due form to Mr Merton as an old and esteemed friend, whom he—Sandford—had not seen for many months. At the conclusion of the ballet, Sandford proposed that we should adjourn to the European Coffee-house, nearly opposite. This was agreed to, and out we sallied. At the top of the staircase we jostled against the commissioner, who, like us, was leaving the house. He bowed slightly to Mr Merton's apology, and his eye wandered briefly and coldly over our persons; but not the faintest sign of interest or recognition escaped him. I thought it possible he did not know me in my changed apparel; but looking back after descending a few steps, I was quickly undeceived. A sharp, swift glance, expressive both of encouragement and surprise, shot out from under his penthouse brows, and as swiftly vanished. He did not know how little I needed spurring to the goal we had both in view!

We discussed two or three bottles of wine with much gaiety and relish. Sandford especially was in exuberant spirits; brimming over with brilliant anecdote and sparkling badinage. He saw in me a fresh, rich prey, and his eager spirit revelled by anticipation in the victory which he nothing doubted to obtain over my 'excellent intentions and wife-pledged virtue.' About half-past twelve o'clock he proposed to adjourn. This was eagerly assented to by Mr Merton, who had for some time exhibited unmistakable symptoms of impatience and unrest.

'You will accompany us, Waters?' said Sandford, as we rose to depart. 'There is, I suppose, no vow registered in the matrimonial archives against *looking on* at a game played by others?'

'Oh no; but don't ask me to play.'

'Certainly not;' and a devilish sneer curled his lip. 'Your virtue shall suffer no temptation be assured.'

We soon arrived before the door of a quiet, respectable-looking house in one of the streets leading from the Strand: a low peculiar knock, given by Sandford, was promptly answered; then a password, which I did not catch, was whispered by him through the key-hole, and we passed in.

We proceeded up stairs to the first floor, the shutters of which were carefully closed, so that no intimation of what was going on could possibly reach the street. The apartment was brilliantly lighted: a roulette table and dice and cards were in full activity: wine and liquors of all varieties were profusely paraded. There were about half-a-dozen persons present, I soon discovered, besides the gang, and that comprised eleven or twelve well-dressed desperadoes, whose sinister aspects induced a momentary qualm lest one or more of the pleasant party might suspect or recognise my vocation. This, however, I reflected, was scarcely possible. My beat during the short period I had been in the force was far distant from the usual haunts of such gentry, and I was otherwise unknown in London. Still, questioning

glances were eagerly directed towards my introducer; and one big burly fellow, a foreigner—the rascals were the scum of various countries—was very unpleasantly inquisitorial. '*Y'en répons!*' I heard Sandford say in answer to his iterated queries; and he added something in a whisper which brought a sardonic smile to the fellow's lips, and induced a total change in his demeanour towards myself. This was reassuring; for though provided with pistols, I should, I felt, have little chance with such utterly reckless ruffians as those by whom I was surrounded. Play was proposed; and though at first stoutly refusing, I feigned to be gradually overcome by irresistible temptation, and sat down to blind hazard with my foreign friend for moderate stakes. I was graciously allowed to win; and in the end found myself richer in devil's money by about ten pounds. Mr Merton was soon absorbed in the chances of the dice, and lost large sums, for which, when the money he had brought with him was exhausted, he gave written acknowledgments. The cheating practised upon him was really audacious; and any one but a tyro must have repeatedly detected it. He, however, appeared not to entertain the slightest suspicion of the 'fair-play' of his opponents, guiding himself entirely by the advice of his friend and counsellor, Sandford, who did not himself play. The amiable assemblage broke up about six in the morning, each person retiring singly by the back way, receiving, as he departed, a new password for the next evening.

A few hours afterwards, I waited on the commissioner to report the state of affairs. He was delighted with the fortunate *début* I had made, but still strictly enjoined patience and caution. It would have been easy, as I was in possession of the password, to have surprised the confederacy in the act of gaming that very evening; but this would only have accomplished a part of the object aimed at. Several of the fraternity—Sandford amongst the number—were suspected of uttering forged foreign bank-notes, and it was essential to watch narrowly for legal evidence to insure their conviction. It was also desirable to restore, if possible, the property and securities of which Mr Merton had been pillaged.

Nothing of especial importance occurred for seven or eight days. Gaming went on as usual every evening, and Mr Merton became of course more and more involved: even his sister's jewels—which he had surreptitiously obtained, to such a depth of degradation will this frightful vice plunge men otherwise honourable—had been staked and lost; and he was, by the advice of Sandford, about to conclude a heavy mortgage on his estate, in order not only to clear off his enormous 'debts of honour,' but to acquire fresh means of 'winning back'—that *ignus-fatuus* of all gamblers—his tremendous losses! A new preliminary 'dodge' was, I observed, now brought into action. Mr Merton esteemed himself a knowing hand at *écarté*: it was introduced; and he was permitted to win every game he played, much to the apparent annoyance and discomfiture of the losers. As this was precisely the snare into which I had myself fallen, I of course the more readily detected it, and felt quite satisfied that a *grand coup* was meditated. In the meantime I had not been idle. Sandford was *confidentially* informed that I was only waiting in London to receive between four and five thousand pounds—part of Uncle Passgrove's legacy—and then intended to immediately hasten back to canny Yorkshire. To have seen the villain's eyes as I incidentally, as it were, announced my errand and intention! They fairly flashed with infernal glee! Ah, Sandford, Sandford! you were, with all your cunning, but a sand-blind idiot to believe the man you had wronged and ruined could so easily forget the debt he owed you!

The crisis came swiftly on. Mr Merton's mortgage-money was to be paid on the morrow; and on that day, too, I announced the fabulous thousands receivable by me were to be handed over. Mr Merton, elated by his repeated triumphs at *écarté*, and prompted by his friend

Sandford, resolved, instead of cancelling the bonds and obligations held by the conspirators, to redeem his losses by staking on that game his ready money against those liabilities. This was at first demurred to with much apparent earnestness by the winners; but Mr Merton, warmly seconded by Sandford, insisting upon the concession, as he deemed it, it was finally agreed that *carté* should be the game by which he might hope to regain the fortune and the peace of mind he had so rashly squandered: the last time, should he be successful—and was he not sure of success?—he assured Sandford, that he would ever handle cards or dice. He should have heard the mocking merriment with which the gang heard Sandford repeat this resolution to amend his ways—when he had recovered back his wealth!

The day so eagerly longed for by Merton and the confederates—by the spoilers and their prey—arrived; and I awaited with feverish anxiety the coming on of night. Only the chief conspirators—eight in number—were to be present; and no stranger except myself—a privilege I owed to the moonshine legacy I had just received—was to be admitted to this crowning triumph of successful fraud. One only hint I had ventured to give Mr Merton, and that under a promise, 'on his honour as a gentleman,' of inviolable secrecy. It was this: 'Be sure, before commencing play to-morrow night, that the bonds and obligations you have signed, the jewels you have lost, with a sum in notes or gold to make up an equal amount to that which you mean to risk, is actually deposited on the table.' He promised to insist on this condition. It involved much more than he dreamt of.

My arrangements were at length thoroughly complete; and a few minutes past twelve o'clock the whispered password admitted me into the house. An angry altercation was going on. Mr Merton was insisting, as I had advised, upon the exhibition of a sum equal to that which he had brought with him—for, confident of winning, he was determined to recover his losses to the last farthing; and although his bonds, bills, obligations, his sister's jewels, and a large amount in gold and genuine notes, were produced, there was still a heavy sum deficient. 'Ah, by the by,' exclaimed Sandford as I entered, 'Waters can lend you the sum for an hour or two—for a consideration,' he added in a whisper. 'It will soon be returned.'

'No, thank you,' I answered coldly. 'I never part with my money till I have lost it.'

A malignant scowl passed over the scoundrel's features; but he made no reply. Ultimately it was decided that one of the fraternity should be despatched in search of the required amount. He was gone about half an hour, and returned with a bundle of notes. They were, as I hoped and expected, forgeries on foreign banks. Mr Merton looked at and counted them; and play commenced.

As it went on, so vividly did the scene recall the evening that had sealed my own ruin, that I grew dizzy with excitement, and drained tumbler after tumbler of water to allay the fevered throbbing of my veins. The gamblers were fortunately too much absorbed to heed my agitation. Merton lost continuously—without pause or intermission. The stakes were doubled—trebled—quadrupled! His brain was on fire; and he played, or rather lost, with the recklessness of a madman.

'Hark! what's that?' suddenly exclaimed Sandford, from whose Satanic features the mask he had so long worn before Merton had been gradually slipping. 'Did you not hear a noise below?'

My ear had caught the sound; and I could better interpret it than he. It ceased.

'Touch the signal-bell, Adolphe,' added Sandford.

Not only the play, but the very breathing of the villains, was suspended as they listened for the reply.

It came. The answering tinkle sounded once—twice—thrice. 'All right!' shouted Sandford. 'Proceed! The farce is nearly played out.'

I had instructed the officers that two of them in

plain clothes should present themselves at the front door, obtain admission by means of the password I had given them, and immediately seize and gag the door-keeper. I had also acquainted them with the proper answer to the signal-ring—three distinct pulls at the bell-handle communicating with the first floor. Their comrades were then to be admitted, and they were all to silently ascend the stairs, and wait on the landing till summoned by me to enter and seize the gamblers. The back entrance to the house was also securely but unobtrusively watched.

One only fear disturbed me: it was lest the scoundrels should take alarm in sufficient time to extinguish the lights, destroy the forged papers, and possibly escape by some private passage which might, unknown to me, exist.

Rousing myself, as soon as the play was resumed, from the trance of memory by which I had been in some sort absorbed, and first ascertaining that the handles of my pistols were within easy reach—for I knew I was playing a desperate game with desperate men—I rose, stepped carelessly to the door, partially opened it, and bent forward, as if listening for a repetition of the sound which had so alarmed the company. To my great delight the landing and stairs were filled with police-officers—silent and stern as death. I drew back, and walked towards the table at which Mr Merton was seated. The last stake—an enormous one—was being played for. Merton lost. He sprang upon his feet, death-pale, despairing, overwhelmed, and a hoarse execration surged through his clenched teeth. Sandford and his associates coolly raked the plunder together, their features lighted up with fiendish glee.

'Villain!—traitor!—miscreant!' shrieked Mr Merton, as if smitten with sudden frenzy, and darting at Sandford's throat: 'you, devil that you are, have undone, destroyed me!'

'No doubt of it,' calmly replied Sandford, shaking off his victim's grasp; 'and I think it has been very artistically and effectually done too. Snivelling, my fine fellow, will scarcely help you much.'

Mr Merton glared upon the taunting villain in speechless agony and rage.

'Not quite so fast, Cardon, if you please,' I exclaimed, at the same time taking up a bundle of forged notes. 'It does not appear to me that Mr Merton has played against equal stakes, for unquestionably this paper is not genuine.'

'Dog!' roared Sandford, 'do you hold your life so cheap?' and he rushed towards me, as if to seize the forged notes.

I was as quick as he, and the levelled tube of a pistol sharply arrested his eager onslaught. The entire gang gathered near us, flaming with excitement. Mr Merton looked bewilderedly from one to another, apparently scarcely conscious of what was passing around him.

'Wrench the papers from him!' screamed Sandford, recovering his energy. 'Seize him—stab, strangle him!'

'Look to yourself, scoundrel!' I shouted with equal vehemence. 'Your hour is come! Officers, enter and do your duty!'

In an instant the room was filled with police; and surprised, panic-stricken, paralysed by the suddenness of the catastrophe, the gang were all secured without the slightest resistance, though most of them were armed, and marched off in custody.

Three—Sandford, or Cardon; but he had half-a-dozen aliases, one of them—were transported for life: the rest were sentenced to various terms of imprisonment. My task was effectually accomplished. My superiors were pleased to express very warm commendation of the manner in which I had acquitted myself; and the first step in the promotion which ultimately led to my present position in another branch of the public service was soon afterwards conferred upon me. Mr Merton had his bonds, obligations, jewels, and money, restored to him; and, taught wisdom by terrible experience,

never again entered a gaming-house. Neither he nor his lady-mother was ungrateful for the service I had been fortunate enough to render them.

CHARACTERS RECONSIDERED.

ADDICTED as men are to the sheepish principle of following where they are led, and apt as the multitude may be to credit what they are told to believe, inquiring and independent spirits make their appearance from time to time to question history, and call for a reconsideration of the characters of its heroes. The general tendency of these inquiries has been to rescue from obloquy great names that may have been undeserving of it—to add to, and not detract from, the majestic images in the yet unfilled gallery of the world's heroes. Many a name once execrated has become respected; many a false man, in the popular estimation, has been elevated into a true man; and many a quasi-demon into a quasi-saint. We shall not attempt to go through the long and illustrious list of such names—a list which, to say nothing of the saints and apostles of Christianity, would include Socrates, Aristotle, Bacon, Harvey, Galileo, Cornelius Agrippa, and a whole host of glorious men, to whose memory the world has done justice for the scorn, hatred, and persecution of their contemporaries. It may not be uninteresting, however, to group together a few minor instances of this kind of reaction in the moral world, of which the effect is not yet complete. We select a few cases still pending in the great court of human appeal, in which the appellants have been heard by their counsel, and in which the great judge, Opinion, has shown by his random expressions, as well as by the tones of his voice, that he is about to reverse the judgment of the 'court below.'

Two remarkable instances of this kind of reaction have taken place with regard to characters in Shakespeare. In his immortal pages, Macbeth stands branded as a weak and cowardly murderer; a man who, goaded by a strong-minded and bad woman, and by the promptings of his own guilty ambition, treacherously slew his sleeping guest—that guest the king to whom he had sworn allegiance, and to whom he owed the double fealty of a subject and a host. Yet recent researches have shown that Shakespeare pilloried a comparatively innocent man, by founding that noble play upon tradition, and not upon history. Macbeth slew Duncan, it is true; but not in his bed—not asleep and unarmed—but in open fight on the field of battle. It does not even appear that Macbeth was a usurper; but granting that he were, still, in the unsettled and semi-barbarous period at which he lived, usurpation was a common occurrence; and in his case the usurpation, if such it were, proved of advantage to the country that acquiesced in it. Shakespeare's narrative was derived from Holinshed, who derived it from Boyce, who again derived it from tradition. Banquo is a personage totally unknown either to history or tradition. Macbeth reigned over Scotland for fifteen years; and if there were a legal flaw in his title to the throne, endeavoured to make a good moral title by the general vigour and policy of his administration, and by his justice to the people. Sir Walter Scott says of him, 'that he broke no law of hospitality in his attempt on Duncan's life. He attacked and slew him at a place called Bothgowan, or the Smith's House, near Elgin; and not, as has been supposed, in his own castle of Inverness. The act was bloody, as was the complexion of the times; but in very truth the claim of Macbeth to the throne, according to the rule of Scottish succession, was better than that of Duncan. As a king, the tyrant so much exclaimed against was, in reality, a firm, just, and equitable prince.' The reaction has thus begun: men have learned to separate the Macbeth of Shakespeare from the Macbeth of history—to admire the first-mentioned as one of the grandest portraiture of crime and sorrow in the whole range of literature; more interesting, although fictitious, than the real Macbeth that lived and moved; but to do

justice at all convenient times to the fame that had the misfortune (for itself, if not for the world) to come in the way of so mighty a genius, and to be made available for its purposes.

Richard III. of England is another royal personage whose memory has been similarly unfortunate in coming into contact with the purposes of Shakespeare. No doubt the world has gained; but the world, while doing justice to the real Richard, will fortunately lose no portion of the delight and instruction derivable from the eventful story of the imaginary one. The materials available for the dramatist's purpose were found in Holinshed, who took them from the prejudiced pen of Sir Thomas More. Later historians denied the accuracy of Sir Thomas More's statements, and the truth of his portraiture; and while they could not gainsay the fact that Richard had committed crimes in the pursuit of power, explained, if they did not apologise for them, by the character of his age, which was one not tender of human life, nor scrupulous as to its means for the attainment of its objects. The Richard of Shakespeare is a gigantic criminal; the Richard of impartial history is still a criminal, but a man not *all* evil—a man that turned to a good use the power that he may have ill acquired; a man that made enemies of his haughty, vindictive, and bloodthirsty nobles; but that ruled the people with wisdom and moderation, and treated them in a manner to deserve, if it did not obtain, their love. His memory has cried aloud for justice. Mr Sharon Turner has done battle in its behalf—has entered the court of appeal, and made out such a case in his favour as goes far to qualify, if it cannot reverse, the previous judgment.

While we are upon the subject of kings, we cannot omit the case of James I.—the alleged bigot and pedant; the mock Solomon, and the butt of ridicule for a long period for every one who desired to have a fling at royalty. Every one who has read the elder D'Israeli's inquiry into the literary and political character of that monarch, will confess that he has found not only a zealous, but an able defender. Mr D'Israeli, as he informs us in his preface to this interesting historical sketch, set off in the world with the popular notions of the character of James I.; but in the course of study, and with a more enlarged comprehension of the age, he was struck with the contrast of his real with his apparent character, and developed those hidden and involved causes which so long influenced historians and memoir writers in vilifying and ridiculing this monarch. Mr D'Israeli's treatise is a masterpiece of its kind. It seeks to prove that the alleged pedant detested pedantry; that the so-called bigot was less bigotted than his age; that the epithet 'Solomon,' applied to him in mockery, ought to have been applied in seriousness and in respect; that the monarch, accused of personal cowardice, dreaded war for his people, and not for himself; and that his contemporaries saw and acknowledged in him those virtues and talents which a succeeding age, led astray by prejudiced writers, altogether denied. Who shall say that Mr D'Israeli has failed in this chivalrous attempt? Not we: on the contrary, we must admit that he has done much to rescue the memory of his hero from obloquy that appears unmerited; and that although 'this philosopher on the throne, and father of his people, lived without exciting gratitude, and died without inspiring regret—unregarded, unremembered,' there is justice to be gathered from the rolling of the centuries; that the violence of the blow aimed at his memory has recoiled upon those who struck it; and that the thinkers of the present age, if they do not share in all the enthusiasm of his defender, at least suspend their judgment, and admit that his detractors may have been in error.

The history of the illustrious Machiavelli is another instance of pertinacious wrong disappearing before the lights exhibited by cool and dispassionate inquiry. For three centuries and upwards, his name has served to designate a particular kind of political duplicity and

cunning. To accuse a statesman of *Machiavellism*, has been to exalt his intellect at the expense of his honesty and virtue—to exonerate him from the imputation of lack of brains, only to brand him as possessing too much for the welfare of his species. ‘Il Principe’ (‘The Prince’), his famous treatise, long considered infamous, brought all this obloquy upon him. In that much-spoken-of, but little known work, he drew up the code of despotism, concealing his satire so well, that the world mistook the hater for a friend of tyranny, and the denouncer of crimes against the people for their apologist. Machiavelli suffered in the cause of freedom; he was put to the torture by a despot, and endured sorrows of many kinds for his devotion to his country. Disgusted with princes, and with the people too, he wrote his celebrated work, intending a satire upon the crimes of rulers. The obstinate world insisted upon receiving this satire in a spirit the very reverse of that which animated its author, with about as little justice as we should exhibit were we to accuse Henry Fielding of preaching up robbery and murder for his ‘Life of Jonathan Wild the Great.’ Machiavelli’s object, it is true, was not quite so apparent as that of the novelist. The people, moreover, were not aware of the friend they had in this illustrious diplomatist. They considered the hard words he employed against men in general as the outpourings of a demoniac hatred. They could not see that the severe satire was intended for their benefit, or make any allowance for the bitterness of feeling with which unmerited suffering had imbued one of the ablest men of his time. Machiavelli dedicated his treatise of ‘The Prince’ to Lorenzo, Duke of Urbino, the usurper of the liberties of Florence; a man whom he hated, against whose government he had conspired, and who had caused him to be put upon the rack to extort from his agony the names of his confederates. This circumstance might have served to open the eyes of the herd of men and of writers to the real purpose of the author; but it did not. Treatise after treatise was written to refute doctrines which Machiavelli detested; and his name became the synonyme for the political criminality and astuteness which it was his real object to hold up to the abhorrence of mankind. Amongst others who employed their pens in this cause was Frederick the Great of Prussia, who wrote in his youth a tract entitled ‘Anti-Machiavel.’ ‘This military genius,’ says D’Israeli, ‘protested against those political arts which he afterwards adroitly practised; and realised in his own character the political monster which Machiavelli had drawn.’ The tide against Machiavelli has long since begun to turn; and though his unfortunate name will, in all probability, survive to designate a species of depravity for which modern languages offer no other, the memory of the man has already received justice from all the impartial students of history, and will doubtless receive justice in due time from a still wider audience.

We need not extend the list, though it were easy to do so. Other names will suggest themselves to the reader, all showing in like manner the certainty of reactions in the moral as in the physical world, whenever there is sufficient strength in the original impetus to produce the inevitable result; and to prove in the long-run, in great matters as well as in small, the truth of the dictum—

‘That ever the right comes uppermost,
And ever is justice done.’

MISSION TO ASHANTEE.

A PARLIAMENTARY paper, purporting to be a report from Lieutenant-Governor Winniett respecting his journey from Cape Coast Castle to Ashantee, having just been laid before the House of Commons, we are enabled to present our readers with some particulars of not an uninteresting kind on the condition of an African nation. The object of Governor Winniett’s journey was to visit the king of Ashantee, and persuade him, if possible, to abandon the ancient practice

of human sacrifice. How he sped in this mission, undertaken by order of the British government, will afterwards appear. The narration of proceedings, which is in the form of a journal, commences by stating that the travelling party consisted, besides the governor, of Captain Powell, commanding a detachment of forty-eight of his men as a guard of honour; the Rev. Mr Freeman of the Wesleyan Missionary Society, who acted as secretary; and about one hundred and fifty men, consisting of the band, hammock-bearers, carriers of luggage, and servants—altogether upwards of two hundred persons. The route was through a rough country, and the distance travelled daily appears to have been from twelve to twenty-five miles. The weather was unfortunately rainy, and therefore camping out at night must have been anything but pleasant. With these preliminary observations, we offer the following condensed and connected string of extracts from Governor Winniett’s clearly-written journal:—

Started from Cape Coast Castle on the afternoon of Thursday, September 28 (1848), and stopped for the night at Yaminansah. Next day, at 6. 15. A.M. ‘we resumed our journey, and travelled through a fine tract of fertile country, studded with silk-cotton-trees, palms, and plantations of the plantain and banana. At 8. 15. A.M. we stopped to take breakfast at the village of Assaybu, and after refreshing ourselves, and giving the soldiers and people a little time to rest, we proceeded to Akroful, a village several miles distant from Assaybu; and on entering it, a party of men came out to welcome me by firing a salute with muskets: I was much gratified with the friendly and loyal disposition manifested by the people. While we rested a short time in this village, the head men came to visit me, and present me some palm wine. In this place there is a small Christian society of the natives, under the care of the Wesleyan missionaries; and I was pleased to observe a small chapel in the course of erection, and nearly finished, chiefly by the personal labours of this little band of native Christians. At 45 minutes after noon we reached Dunkwa, and took quarters for the night in the school-house occupied by the Wesleyan Missionary Society. Here I was received by Otu—a Fanti chief, and the successor of Payntree—mentioned so honourably by Bowditch in his account of his journey to Kumasi in 1817. He (Otu) had come over from Abakrampa, the place of his residence, distant about ten miles from Dunkwa, accompanied by many of his captains and people, to meet me, and bid me welcome to that part of the Fanti country which is under his control. After resting a little from the fatigues of my journey, I spent some time in conversation with Otu and his captains.

‘Shortly after our arrival, I received from Otu a present, consisting of two sheep, some yams and bunches of plantain, with which token of good-feeling and attachment I felt much gratified. Dunkwa is well situated on high ground, near to a good supply of water at all seasons of the year, and surrounded by fine plantations of plantain and banana. It is one of the largest of the Fanti krums, or villages, and has a population of about 1200 souls. The Wesleyan school here is of recent establishment; but it contains thirty-eight children, and promises well.’

On the ensuing three days passed through a number of populous villages; stopping on Sunday, and attending divine service at a place where there was a chapel and mission-house.

‘October 4, Wednesday.—At 6 A.M. we commenced crossing the river, and in about an hour, the people having all passed over by several trips of a large canoe, we began our journey in the territories of the king of Ashantee. The width of the Prah, at its ordinary height, may be about 80 yards at the ferry, and from one extreme bank to the other about 100 yards. The progress of the current seemed to be about three miles an hour. The forest scenery on the banks of the river is exquisitely beautiful, arising from the elegant and varied

foliage of the trees. We stopped to take breakfast at Kikiwiri, the first village which we reached after crossing the Prah. Early in the morning we were overtaken in the forest by heavy rain; and consequently, when we arrived at the small village of Ansah, at 3 P.M., we were wet through, and greatly fatigued with the labour of walking a considerable distance over a muddy and rugged road. The village was so small, that comfortable quarters could not be obtained for the people; and many of the soldiers, hammock-men, and carriers were therefore obliged to bivouac in the open air on the wet ground. It was great cause of thankfulness that it did not rain during the night; for had it been otherwise, the people would have suffered greatly.

Till Sunday, October 8, passed through the country formerly occupied by the Assins, and now in a state of ruin. The inhabitants are so poor, that provisions could with difficulty be procured in exchange for gold-dust.

On Monday morning, October 9, reached Karsi, about five miles distant from Kumasi, the capital of Ashantee. Here I was waited on by the king's messengers, who were sent to conduct us into the town. At noon we proceeded in full preparation for our entry; and at a distance of about a mile from the town, a party of messengers, with gold-handled swords of office, arrived with the king's compliments.

After halting for a short time, we proceeded to the entrance of the first street, and then formed in order of procession. Presently a party of the king's linguists, with four large umbrellas, ensigns of chieftainship, came up to request me to halt for a few minutes, under the shade of a large banyan-tree in the street, to give the king a little more time to prepare to receive me. After a brief delay of about twenty minutes, during which a large party of the king's soldiers fired a salute about 100 yards distant from us, we moved on to the market-place, where the king and his chiefs were seated under their large umbrellas, according to the custom of the country on the reception of strangers of distinction. They, with their numerous captains and attendants, occupied three sides of a large square, and formed a continuous line of heads, extending about 600 yards, and about 10 yards in depth. Under each large umbrella, and towards the back of the line, the umbrellas being placed about 30 yards from each other throughout the whole line, a chief was seated on a native chair, decorated with round-headed nails of brass, silver, or gold, according to his rank, with a narrow space left open among his people in the foreground, that we might see him distinctly as we passed, and, according to the custom of the country on such occasions, wave the right hand in token of friendly recognition. After we had passed along about three-fourths of the line, we found the king surrounded by about twenty officers of his household, and a large number of messengers, with their gold-handled swords and canes of office. Several very large umbrellas, some consisting of silk-velvet of different colours, shaded him and his suite from the rays of the sun. The king's chair was richly decorated with gold; and the display of golden ornaments about his own person and those of his suite was most magnificent. The lumps of gold adorning the wrists of the king's attendants and many of the principal chiefs were so large, that they must have been quite fatiguing to the wearers.

The king of Ashantee is about six feet high, stout, and strong built, and appears to be about from fifty-two to fifty-six years of age. He is a man of mild and pleasing countenance, and quite free from any of those shades of native ferocity which are so disgusting to the taste and feelings of a European.

We occupied about an hour in moving in procession from under the banyan-tree, where we had rested on entering the town, over a space of about a mile and a-half in length, to the end of the line formed for our reception; after which we proceeded to an eligible situation in an open space at some distance from the market-place, and there took our seats, according to the etiquette

of the country, to receive the complimentary salute of the king and his chiefs in return. At 3.15 P.M. they commenced moving parties in procession, and occupied the ground before us from five to ten deep, until 6 P.M., a period of two hours and three-quarters.

Those whom we first saluted in the market-place passed us first in order, maintaining the greatest regularity; each chief was preceded by his band of rude music, consisting chiefly of drums and horns, followed by a body of soldiers under arms, and shaded by a large umbrella. Those of the highest rank stopped before me, and danced to the rude music, by way of testifying their satisfaction at seeing me, and their good-will towards me.

When the king came opposite me, he first danced, and then approached me, and I took him cordially by the hand. After the king, other chiefs, and a large body of troops, passed in due order, and at 6 P.M. the ceremony closed.

During the whole of the day the greatest excitement prevailed in the town, the population of which was swelled by strangers called in by the king, or detained after the close of the recent yam custom, on account of my visit, from the usual amount of about 25,000 to upwards of 80,000.

Kumasi is very different in its appearance from any other native town that I have seen in this part of Africa; the streets are generally very broad and clean, and ornamented with many beautiful banyan-trees, affording a grateful shade from the powerful rays of the sun; the houses looking into the streets are all public rooms on the ground-floor, varying in dimensions from about 24 feet by 12 to 15 feet by 9; they are entirely open to the street in front, but raised above its level, from 1 to 6 feet, by an elevated floor consisting of clay polished with red ochre; they are entered from the street by steps made of clay, and polished like the floor.

The walls consist of wattle-work plastered with clay, and washed with white clay: the houses are all thatched with palm-leaves, and as the eaves of the roofs extend far over the walls, the front basement of the raised floors, which is generally covered with rude carvings of various forms, have their beautiful polish preserved from the effects of both sun and rain. This mode of building gives to the streets a peculiar aspect of cheerfulness.

Each of these open rooms is connected with a number of rooms behind it, quite concealed from public view, which constitute the dwellings of the people, and there may be connected with each public room, in the manner above described, from 50 to 250 inmates.

Immediately after the procession had closed, we repaired to the Wesleyan Mission-House, where we found comfortable arrangements made by the Rev. Mr Hillard, the missionary resident in Kumasi, for convenient quarters during our stay.

Greatly as I had been interested with the manner in which the king received me, the appearance of such a vast number of uncivilised men under such entire control, the new style of building exhibited, and its pretty contrast with the ever fresh and pleasing green of the banyan-trees, I was equally interested and excited at the appearance of the Wesleyan Mission-House—a neat cottage, built chiefly with the teak or edoom wood of the country, containing on the second floor a large hall and two airy bedrooms, entirely surrounded by a spacious veranda; and on the first floor a store-room and a small chapel or preaching-room; in the front, looking into one of the finest and most open streets in the town, is a little garden, planted with orange, lime, bread-fruit, and fig-trees (the two latter having been recently introduced from the coast), and behind the house a spacious courtyard, planted with the sour-sop-tree, and surrounded by rooms consisting of servants' and workmen's apartments, so simply constructed, and yet so spacious, as to afford room, without any inconvenience, for quarters for the whole of the men consisting of the guard of honour.

'As I sat down in the airy spacious hall in the cool of the evening, after all the toils and excitement of the day, and contemplated this little European establishment, planted in the midst of barbarism 200 miles into the interior of Africa, exhibiting to thousands of untutored pagans the comforts and conveniences of civilised life, and the worship of the true God, I could not but think deeply and feelingly on the great triumph thus achieved by Christianity and civilisation.'

Nine days were now consumed in the ceremonial of exchanging presents. Desirous of seeing the king, but found that he was unavoidably occupied with superstitious observances. A private and preliminary interview only permitted.

'October 19, Thursday.—At 3 P.M., I went to the palace, attended by Captain Powell and the Rev. Messrs Freeman and Hillard, to have an interview with the king, for the transaction of business.

'The apartments of the royal premises are of the same order and style as those of the native dwellings generally—consisting of a number of square courtyards, connected with each other by doors at the corners, and having on one, two, three, or all sides, a room entirely open on the side looking into the yard, raised from one to four feet above the level of the yard, and communicating with it by steps made with clay, and like the public rooms in the streets already described; but the royal apartments are of much larger dimensions than those of the people, and are kept exquisitely clean. The king's residence in Kumasi, with its numerous attached buildings, covers a space of ground not less perhaps than five acres.

'On our arrival, we found the king seated in one of the squares of the palace, surrounded by many chiefs and officers of his household. We soon entered into conversation; and I told him that my visit was one of pure friendship, for the purpose of promoting good intelligence betwixt him and her Majesty's government. On this head I made many remarks, with which he seemed much pleased, and expressed his great satisfaction at the kind feelings manifested by her Majesty in authorising me to visit, and in sending him so valuable a present as that which had been delivered to him. Another subject which occupied us for some little time was, the best means of communication betwixt his and my government; and I embraced the opportunity of thanking him for the kind protection which he had afforded the Christian missionaries who had visited his country, and also of expressing my hopes that he would still continue to do so. The interview lasted about an hour.'

The next day the king paid a visit to the Mission-House, attended by his officers of the household, and many of his children. He stayed about an hour, conversing freely; inquired how many queens had ever occupied the British throne; the age of her present Majesty; and whether the Prince of Wales was heir to the crown; and was much gratified and amused when Captain Powell drew up his men and fired a salute.

On Saturday the 21st his majesty again made his appearance in front of the Mission-House, whither he came to drink palm wine, as a mark of respect to his guests. He came to the spot in a beautiful little phaeton, presented to him by the Missionary Society in 1841, and which he valued highly, and had kept in excellent condition. The English party joined him, and the band was ordered out to play, by way of returning the courtesy. While they were sitting in the street, one of the chiefs entertained them with a dance: this scene was prolonged for nearly two hours with much merriment and pleasantry. During this singular visit, from 5000 to 6000 of the populace were present, yet there was ample room for all, and no crowding, the street being nearly 200 yards in width. The city itself is about two miles in length, and a mile wide. They received an invitation to dine with the king at Eburasu, his country-seat.

'October 24, Tuesday.—At 2 P.M. we started for

Eburasu, distant about 3½ miles from Kumasi. On our arrival we took our seat under the shade of a large silk-cotton-tree opposite the palace, and the king, in a few minutes, came over to us, took me cordially by the hand, and bade me welcome: we then proceeded to look over the premises, conducted by one of the officers of the household; while the king delicately took his seat under a tree near the spot where we had been sitting. I have already described the character of the native dwellings, and observed that the royal premises are kept more clean, and are of larger dimensions, than those of the people: these distinctions are very striking in the aspect of Eburasu.

'Many of the rooms around the squares were occupied with neat bedsteads of European manufacture, dressed with silk hangings, and decorated with mirrors, pictures, time-pieces, fancy boxes, chandeliers, and many other articles of European manufacture.

'After passing through and examining the principal apartments, we entered a square where the table was set for dinner, under the shade of some large umbrellas, about 10 feet in diameter, and the king immediately entered, and engaged freely in conversation with us; in a short time dinner was placed on the table, in a manner quite consistent with English taste, and it was really very nicely served up: it consisted of soup, a sheep roasted whole, a sheep dressed in joints, a turkey, fowls, a variety of vegetables, plumpudding, oranges, ground-nuts, &c. ale, wine, and liqueurs.

'The king excused himself from actually sitting and eating at table, on the ground of his inability to use with ease a knife and fork like a European; but he sat opposite me, and looked on with great interest, took wine with me and the gentlemen of my suite, and talked with great freedom on ordinary topics of conversation.

'At all our previous interviews he has generally been dressed in a rich cloth, but on this occasion he wore an officer's uniform.

'After dinner the king took us to the apartments of the ladies of the court, and introduced me to them, declaring that no Ashantee, not even a favourite chieftain, had ever been introduced to that part of the palace, or to the ladies occupying it.

'On leaving this part of the palace, we went out and sat down with the king under the shade of a large tree for about twenty minutes, and then, as evening was advancing, we turned our faces towards Kumasi: the king accompanied us in his palanquin about two miles on the road, and then we took our leave of him.

'The conduct of the king throughout the day was extremely gratifying, and I greatly enjoyed the privacy in which we had dined with him: no chiefs were present; there were only two persons of distinction present connected with the household, and they were merely in attendance on the king, and not taking any part in the affairs connected with the dinner.

'The remains of the dinner, together with some large pots of soup prepared for the occasion, were sent into the Mission-House for the soldiers and people.

'The situation of Eburasu appears to be well chosen: the ground is high, the country open, and the distance from Kumasi very convenient; and it is approached by an excellent road, founded with care, and kept clean and in good order.

'The extent of the royal premises is very considerable, covering perhaps four acres of ground.

'At 8 P.M. the king sent messengers to the Mission-House to acquaint me that he had returned to town, and to request that we would go down to the palace and spend an hour with him: to this I readily consented, and was much gratified, on our arrival at the palace, to find him almost alone, and quite disposed for friendly conversation. Ossai Kujo, the heir-apparent to the throne, and three or four of the king's principal linguists, were the only persons present.

'We immediately entered into conversation, and after briefly adverting to the kindly feelings of her Majesty's

government towards him, I embraced the favourable opportunity thus offered for speaking to him on the subject of human sacrifices: I told him of the anxious desire on the part of her Majesty that these sanguinary rites should be abolished, and begged his serious attention to a question so important to the cause of humanity.

'In answer to these remarks, he inquired whether I had seen any instances of human sacrifice taking place since I had entered his dominions. I certainly had not seen or heard of any, and therefore expressed myself to that effect; and he then observed, that although human sacrifices were a custom of his forefathers, he was reducing their number and extent in his kingdom, and that the wishes of her Majesty should not be forgotten. . . . Matters relative to the Wesleyan mission in Kumasi were then referred to, and I was much gratified to find how completely the mission has secured his confidence and esteem.

'After conversing with the king for nearly an hour, we returned to the Mission-House, greatly delighted with all the pleasing circumstances of the day.

'October 26, Thursday.—At 7 A.M. we visited the king, to take our leave of him previous to our departure. On our arrival at the palace, we found the king ready to receive us at this early hour.

'The interview was quite private, like that of Tuesday evening, and the same persons were also in attendance on him. I again adverted to human sacrifices, and expressed my satisfaction at the remarks he had made on the subject during our last interview. He then observed that the number of human sacrifices made in Kumasi had been greatly exaggerated, and that attempts had thus been made to spoil his name. He wished me to understand that human sacrifices were not so numerous in Kumasi as they had been represented, and expressed a hope that mere reports relative to such a subject flying about the country would not be listened to; and he then observed, "I remember that when I was a little boy, I heard that the English came to the coast of Africa with their ships for cargoes of slaves, for the purpose of taking them to their own country and eating them; but I have long since known that the report was false, and so it will be proved in reference to many reports which have gone forth against me." I answered that I believed him, and that I hoped he would not forget that in every life which he saved from sacrifice, he would be considered as conferring a favour upon the Queen of England and the British nation.

'After conversing with him thus in the most unrestrained manner for about half an hour, we took our leave of him by shaking him cordially by the hand, and then returned to the Mission-House.'

On Friday, October 30, the party started on their return homeward, and reached Cape Coast Castle without any misadventure on Saturday the 4th of November.

The expenses of the expedition charged against the government appear to have been £305, 11s. 10½d.; and we can only wish that public money had always been as well spent.

COUNSELS TO THE WORKING-CLASSES.

In the fourth volume of 'Lectures to the Working-Classes,' by W. J. Fox, M.P., we find the following wholesome and friendly counsels to the parties addressed. It is earnestly to be hoped that they may be taken in good part, and acted on:—

'The factious object of plaguing the middle-classes [in their effort to abolish trading monopolies], and of showing them that, even for the most righteous purposes, they were powerless without you, was defeated as it deserved. They succeeded, not only without your undivided support, but in spite of the active hostility of thousands who muster in your ranks, and of some whom you recognised as leaders. You thus made enemies, neutrals, or dubious friends of numbers whom your cordial co-operation, in a movement which involved your own interests as deeply as

theirs, would have won to the support of your political rights. Such is the tendency of a narrow and party expediency. You were taught the crooked tactics of faction, and learned them with fatal facility. The blot upon your scutcheon is the darker, because you did not act in ignorance, or in a consistent error. . . . In fact, you have been led too easily, and given your confidence too readily. A class has risen up amongst you who get their living by agitation and organisation. They toil, not with their hands, but with their tongues. The beer-shop is their factory and home. The loom and the plough know them not, yet they always affect to speak in the name of the working-classes. Their harangues glitter with pikes, and smell of gunpowder, although they generally contrive to keep their own persons out of harm's way. They drill you to clamour, and would drill you to blood and plunder could they do it safely. They fawn on your worst faults, and yelp and snarl at all other classes, or at those of your own class who resist their dictation. They are fed by your enemies or pretended friends, to make tools and fools of you for selfish purposes. Through them the demagogue cajoles, the aristocrat bribes, the adventurer plunders, and the spy betrays you; and they are a ready agency for any scheme however preposterous, criminal, or disastrous. I write no names under the picture, and am content to be called a dreamer if nobody knows anything of the originals. Agitation, thus pursued, is not an honest trade. . . . You excite each other, while society is contemptuously calm around you; or only in the more timid exchanges its calmness for alarm. And then the honestly fervid and incautious are laid hold of, to expiate their rashness by enduring judgments due to criminality, while the crafty stimulators skulk into darkness until circumstances are again favourable for following their avocation.

'Strangely enough, you who have most need of co-operation, leave it to the aristocratical and middle-classes, and look on listlessly or enviously at the splendour of club-houses, and the convenience of railways, without asking how they are created, or heeding the lesson which they present to your eyes and ears. There are, it is true, some legal difficulties in your way, but they are not of the most formidable description; you rarely advance so far as to come into contact with them, and their removal would not be difficult when once your earnestness had made them an obvious grievance. To some extent you may become your own employers, your own landlords, your own tradesmen, and that greatly to your advantage and independence. Co-operation in expenditure is available more easily, and with more certain and immediate results, than co-operation for production. Various experiments, the results of which are before the public, have demonstrated that the great blessing of comfortable homes, with all the incidentals of ventilation, warming, cooking, &c. is within your reach for less cost than that of your often miserable and noisome abodes. Why call for help, instead of having the virtue and prudence to help yourselves? You have shown, through many a severely trying time, that you can bear manfully; it remains to be seen that you can also act wisely. Do not rail at political economy: you had better study it. If its principles be sound, they cannot be abrogated by legislation, nor destroyed by an insurrection of labour against capital. If those principles be sound, and a large induction has satisfactorily established them in the minds of the ablest thinkers, they are simply an exposition of the course of nature, of the sequence of cause and effect, which is as certain in the world of trade as the law of attraction in the solar system. They are merely the brief expression of classified phenomena, like the laws of mechanical agency or of chemical affinity. You must work in accordance with them, in the one case as in the other, or disappointment is the inevitable result. You can no more destroy the power of capital, or the dependence of labour upon capital, than you can destroy the impeding force of friction, or square the circle. What millions have been wasted in useless strikes! Nor is the offence against truth, as embodied in political economy, the worst, morally speaking, which has been committed: many of you have been the sorest enemies of the rights of labour, and severer oppressors of your brethren than your hardest taskmasters. Honest and skilful men, and in peril of starvation, have been hunted from shop to shop, from one establishment to another, because they had not served a regular apprenticeship, till they were fain to find a loathsome shelter in the poor-house, or lie down and perish by the wayside. Some of your combinations are as relentlessly exclusive as the

sternest monopolists. This is a crying injustice. It is cruelty, where the title to sympathy ought to have been most promptly and heartily recognised. The jealousy with which some trades keep down their numbers, excluding all influx from other trades, limiting the number of the young employed, lest they should grow up into competitors, and even invading the natural right of their own members to train up all their children to whatever occupations they deem most advantageous, is a violation alike of free trade and of common humanity. It tells sorely against your moral right to complain of the oppressions of other classes when you thus oppress one another. In such conduct you may be true to your shop-comrades, but you are false to the working-class as a body. The freest circulation of labour is the common right and common interest of that class. It is one of the best physical benefits of education, which enables a man more readily to qualify himself for passing, when necessary, from one occupation to another. It is the corrective and equaliser of a redundant supply of labour for some trades, and a deficient supply for others; and it is the surest safeguard against those vicissitudes in trade and commerce which so destructively affect large masses of the labouring population, and plunge them into prolonged and bitter suffering. Let every man be free to earn his living as best he can. It is not the part of a fellow-labourer, a brother workman, to strike down his untasted loaf to the ground, or dash the cup from his parching lips.

INFLUENCE OF WOMEN.

Guides and guardians of the rising generations, mothers chosen by Providence for the grand ministry of preparing in our children brave and upright citizens for our country—it is for us to provide the rule and guide; it is for us to present to Italy in our sons magistrates of integrity, generous writers, men of activity, firmness, and justice, lovers of the beautiful and of the ancient virtues. Let us, then, examine the means by which we may attain so noble an object; let us endeavour to comprehend with clearness and precision what is the character of true civilisation, what are the vices and errors which oppose its progress, what are the thoughts and ideas by which they are most particularly favoured; what are the wants of our age, the virtues necessary to it, the inclinations and usages which contend with and impede their advance. And when we shall have renewed and reformed our own education, which in these respects, and among so many women, has been so unworthily neglected, let us strive to quicken in the hearts of our children the desires, the affections, and the hopes which, rendering man good in himself, render him also useful to others, and fitted to accomplish his social duties with facility, fervour, and firmness. Let us believe that in acting otherwise we shall be unable, without untruth, to declare our love for our country; and thus, by the effect of our own errors and negligence, a name formerly so dear to the world, and so much honoured, would remain unworthily buried in corruption.—*On the Moral Education of Italian Women, by Signora Ferrucci.*

'MUSIC OF THE WILD.'

In the summer of 1846 we were riding along the ridge of Cefyn Bryn, a mountain which extends from north-west to south-east across the peninsula of Gower in Glamorgan-shire; it was one of those still bright summer days in which the vibrations, or, more properly, the modulations of the atmosphere may be seen playing along the surface of the ground—when I became gradually aware of a faint Æolian-like sound, which I at first attributed to imagination or the hum of insects. My companion, however, soon remarked on it; and as it became louder and more distinct, the ponies, by their uneasiness, and the restlessness of their eyes, showed that they too heard the strange sound, which continued whilst we passed over about two miles of ground; but on commencing the descent on the eastern side we lost it. The nearest thing to which we could compare this unearthly music was the vibration of air which is sometimes heard and felt during some peculiar states of the atmosphere, if a steamer is 'letting off her steam' at eight or ten miles' distance: but neither this nor any other material thing will give a just idea of this sound, which even in its exquisite beauty was most distressing from its *universality* (I can find no other word which will at all express the feeling which it conveyed). I afterwards heard that others had been astonished by this remarkable phenomenon, which fully enabled me to under-

stand the feeling with which the ignorance of superstition has always regarded sounds such as these, or indeed any which it could not understand.—*From a correspondent.*

MY CHILDHOOD'S THOUGHT.

THREE fields beyond our dwelling-place, a limpid streamlet floweth,
From spring-head onwards I have traced it wheresoe'er it goeth;
I used to idle on the banks, and childishly to ponder
O'er that river's shining course with pleasant awe and wonder,
Arranging in my secret mind a creed of mystic birth—
That Elfin river was a type of my own doom on earth.
And so from spring-head to the vale where many waters meet,
I learnt the story page by page, and other lessons sweet.
Where the yielding greenest moss gathers o'er the rounded rocks
'Tis the shepherds' favourite rest, crook in hand, to watch their
flocks),
There amid the scented thyme, fern, and hyacinthine bells,
Forth a hundred ripples gush on flowery paths to distant dells;
'Mid this waste of summer sweets, mark a fostering hand is near,
And a marble basin fair receives some falling diamonds here;
Thence again 'mid beds of roses, sporting, toying on its way,
Where a classic temple craves mirrored grace and fond delay,
Heedless on the water runneth, wideneth, and will not stay;
Tasteful bowers are left behind, grand and festal scenes are o'er,
And ere spring-head murmurs fade, bids adieu for evermore.
Merrily the streamlet floweth, hidden under archways drear,
Merrily it floweth through ruins dim and sights of fear;
'Tis a young and saucy streamlet frolicking so lightly by,
With its surface all unruffled, e'en though wintry breezes sigh;
Gliding on transparently with a murmuring song for ever,
Looking not to right or left—oh, it was a careless river!
Through the sheltered pasture-fields, winding in and winding out,
How the frisking waters ran, hereabout and thereabout!
Old oak-roots and ivy-leaves, cowslip beds and violet banks,
Washing o'er, and now and then foaming up and playing pranks.
'Twas an idle, roving life; but the dancing days were done,
When a graver work was found from the dawn to set of sun;
And the noisy mill-wheel turning, whispered to the busy water—
'Thy proud heart is humbled now, dainty, foolish, idle daughter!
Useful days and dreamless nights fill up thine appointed race,
While the stars reflected shine on the mill-pool's placid face.
But stars shone on the other side of that clever talking mill,
And the holy moonbeams fell not alone on waters still.
Darting forward with a power they had never known before,
Swiftly onward now they flew escaping from the prison door;
Flowery meads and gardens trim were as though they ne'er had been,
Darksome depths, and raging foam, and splitting rocks made up
the scene.
There is a deep and dread abyss, and into it the water leaps—
A silver thread diverging ere the furious current madly sweeps;
I shrank to hear the distant roar of the tumbling waters wild,
I prayed no wanderer forlorn along that way might be beguiled,
But follow by the silver thread to pastures fair where nature smiled.
Straight and narrow is the stream, the humble stream is known to
few,
It leads to woodland solitudes, and bids the heartless crowd adieu;
Straight and narrow, pure and deep—onwards, onwards calmly
gliding—
Ocean's mighty bosom this, and many silver streamlets hiding.

LIBRARY OF THE BRITISH MUSEUM.

A Parliamentary return 'shows that the total number of volumes of printed books received from 1814 to 1847 inclusive, under the Copyright Acts, by the trustees of the British Museum, amounts to 55,474; and the number of parts of volumes, including music, to 80,047. The number of maps, charts, &c. received since 1842 amounts to 187, and the number of parts of maps, &c. to 131. The total number of volumes of printed books contained in the library of the Museum at the end of the year 1848 amounted to about 435,000; the number of maps, plans, and charts to 10,221; the volumes of manuscripts to 29,626; the rolls of various kinds to 2946; the number of charters and instruments to 23,772; the number of manuscripts on reed, bark, and folded, to 208; the number of papyri to 55; and the number of seals and impressions to 851.' The number of volumes in the Bodleian Library of Oxford is about 220,000, and the number of manuscripts 21,000.

PERSONAL ORIGINALITY.

ANY one who is strikingly distinguished from the generality of mankind by some predominant quality of intellect or disposition, is usually styled an Original. His personal characteristics are so manifestly distinct and individual, as to give the impression of a constitutional difference, such as is not usually observable among men. A man of this kind appears to us as an exceptional nature: his bold identity stands out from the multitude, like some prominent headland, or mountain peak, among the lesser eminences and trivial inequalities by which it is surrounded. There is no possibility of confounding it with the ordinary manifestations of personality, any more than there is a likelihood that we should fail to discriminate the Alps or the Andes from the inconsiderable undulations of a comparatively level country. Men such as Milton, Mirabeau, and Napoleon, are persons of such a determinate individuality, as to be instantly and for ever distinguishable from the rest of their generation. They are among the prominences and towering projections of humanity, whose figure and elevation assign to them a distinction in the history of human opinion and activity, equivalent to that which a Mont Blanc or a Chimborazo holds in the geographical arrangements.

This personal ascendancy is the colossal revelation of a latent originality which abides in all men. As there is no human face exactly like another, so neither is there any mind, or intellectual constitution, precisely proportioned after another's image; but each has some dissimilarity of features, and a distinct personality of its own. Men are never duplicates of their progenitors or contemporaries, but they are the infinite variations of a common nature, having each a separate state of being to unfold, and a separate destination to fulfil. Without some slight shade of originality there is no man born into the world. The most stupid person extant is different from all others by his superlative stupidity, if by nothing else; and his life accordingly, if developed in conformity with the tenor of his constitution, will present aspects of individual diversity. His peculiar distinction may have little to recommend him to himself or to the consideration of his fellows, but it is not the less a fact; and we may say, in passing, that the obviously wisest thing for him is, to accept his character for what it is, and to adjust himself in the scale of things according to the manner which his nature has prescribed. If in the ranks of intelligence he is palpably the lowest, the lowest place in the human relations will be most suited to his capacity; and he will be happiest, and in the best way provided for, therein. A true adjustment of men to their appropriate position in the world would go far towards opening to every one the chance of attaining to the place in which his personal gifts and accomplishments could be brought into the most fitting and com-

plete activity. Society were then in all respects perfectly and harmoniously constituted; and, so far as the social institutions are concerned, there would be nothing left of what is right and beautiful to be realised. The kingdom of Perfectibility would have come, and there would be universal gladness and satisfaction on the earth.

What we desire here, however, more especially to indicate, is the fact of every man's personal independency—of his being a new variety of human power, destined to work out a new and peculiar existence. Given an altogether dissimilar apportionment of faculties, there will necessarily result from their due employment a new and hitherto unprecedented manifestation. Every sufficiently cultivated man will have an identity as complete and determinate as that which appertains to the pre-eminent characters whose magnificent isolation we admire; though, as the consequence of a less conspicuous endowment, it is not likely to be so boldly and prominently marked. An ordinary hill does not present the commanding appearance in a landscape which naturally belongs to a mountain, but the hill is not, therefore, the less *real*, or in anywise despicable as a portion of the globe. Not an atom in the universe could be spared, or innocently and without prejudice subtracted from the complement of creation. In like manner, there never was a man endowed with life who was not in some sort essential to the perfection of that universal humanity which he, under a partial and limited personification, represents. When Luther said that God could not do without great men, he uttered, profanely, a really profound truth; since we may be assured that such men are needful to the world's affairs, or they would not have been equipped with gifts and abilities so largely disproportionate to the rest. But if the assumption be true as far as concerns the higher intellects, it must be seen to hold equally in regard to all the lower manifestations of intelligence; and every man in his degree must be esteemed as a necessary and indispensable incarnation. For we are constrained to respect the integrity of the Original Wisdom, and may not impiously attribute to that august Power any superfluous creation.

From such a consideration of mortal being, there will follow some significant results. We can perceive that a man's duties are co-extensive with his capabilities. Each man stands in an original relation to the Supreme Soul, and is responsible to that for the complete culture and development of his nature. The law of his existence is accordingly an indivisible and unlimited self-reliance. He is constitutionally bound to unfold *himself*—conscientiously to work out his peculiar individuality. His personal gifts and tendencies have an obvious reference to the individual life which he is appointed to accomplish. No law is so sacred to him as that which he will find written in his consciousness. Every attempt to represent himself after the model of another, so far at least as his spiritual

identity is thereby diverted into a foreign shape, will result in distortion and disarrangement of his integrity. Imitation is fatal, is a violation of that sacred personality which has been intrusted to his keeping, and whose entirety it is enjoined him to preserve as the foundation of his welfare. He shall not import into his constitution any irrelevant or adventitious elements, but diligently weed the garden of his mind of everything that does not properly consort with its free and graceful cultivation and adornment. Whatsoever he may receive from books, or draw out of the experiences of other men, he must digestively assimilate and incorporate it with the action of his own faculties. Nothing that he cannot transform into a personal power, or susceptively accommodate to the enlargement of his original resources, can be rightly considered to belong to him, but, as far as he is interested, is unimportant and extraneous. Certain facts and images make a more resolute impression upon one man than upon another: these, if he will take thought of it, have a reference to his endowments, and exert a special influence over his education. They are the hints which Nature offers for the acceptance of his intellect, that he may the more perfectly fulfil the destination whereof he is inwardly advertised, and which, being successfully attained, will be seen to be the appropriate outcome of his inherent qualities.

A strict conformity to the pure idea which he personally represents would render every man a unique character. Men would see in him a clearly-defined and self-subsistent nature; one whose life was the growth of principles within his soul—the natural embodiment of his intuitions—and not a loose and perverted incoherency, such as results when a man submits himself to be fashioned merely or principally by circumstances. That want of a definite character which is so commonly observable in the generality, follows from a prior want of truthfulness in themselves. What Pope said sarcastically of women—that for the most part they had no character at all—seems to be true to a large extent of men. But there is no deep-laid necessity for this; for if a man would abide steadily by his instincts, and trust to the spontaneous action of his mind, his character would inevitably grow out of the laws of his being, even as the branches and foliage of a tree proceed out of its natural vitality. A man needs only to be strictly and emphatically himself, and he will not want character. By truly unfolding his latent capabilities, by wisely asserting through word and deed whatsoever his pure reason shall command, by so exercising his powers as to reflect faithfully his individual nature, he shall not fail to exhibit traits of originality, and show forth to the world what manner of man he is. If he will but think of it, he is verily here to do that. Why should he cramp his energies into a foreign shape when the authentic type of his existence is in himself? All this painful striving to appropriate the supposed graces and characteristics of another—this restless ridiculous ambition to be anything but what we are—serves only to pervert and dissipate the native force whereon all manful integrity is dependent. Let the private thought be trusted, follow the honest suggestions of your conscience, and earnestly endeavour to be what your best insight tends to make you. All great men have accepted the admonitions of their genius, and heedless of the suffrages or clamours of the inconsiderate, have unhesitatingly relied upon their inward sense of what was right and fitting to be by them spoken or performed. By no other method can any man attain to that noble unity of life and purpose which is ever his highest and worthiest distinction. He must be a faithful representative to the world of that inmost form of being which is centered in his consciousness, nor aspire after aught that is not natu-

ral to his faculties; for thus only can he testify of the Supreme intentions in creating him, and adequately fulfil his true relations to the universe.

Unfortunately all this may be admitted, and yet it will be felt that there are practical difficulties which oppose the aspirations we are enforcing. In society every man is but a part, not a whole: in youth his destiny has sent him into a career possibly not congenial with his faculties and tastes; and worse than this, considerations of self-interest—absolute means of existence—may oblige the most noble-minded to assume the tone and position of subserviency. We cannot legislate for exceptions to great rules. Our belief is, that, all things considered, there is infinitely greater scope for acting on native motives and self-original principles than the world usually gets credit for. At all events, let each person ask himself this—Shall I be a mere imitator, the slavish follower of the herd in all things, or shall I try to work out opinions and views of my own? With candid self-examination, how many might not attain distinction, or at least be greatly useful in their generation, instead of sinking into the nothingness, and it may be the vice, of imitation. What we want to see is effort—effort to inquire, and to act on the inquiry, ‘What am I most competent to do?’ Let us be fully assured, all exceptions to the contrary, that each man’s vocation is prescribed and indicated by the nature of his talent. Endless, truly, are the obstructions whereby a man is hindered from adjusting himself rightfully to his work. Nevertheless, a certain work always belongs to him: namely, that which he can best do—that which affords him the highest and purest satisfaction when it is done. If any man is unconscious of a definite inclination towards any particular species of activity, but finds all, or nearly all, indifferent, it becomes him at least to do *well* that which falls at any time in his way. ‘Whatsoever thy hand findeth to do in the way of duty, do it with thy might.’ By putting heart and conscience into his work, there is no labour which a man may not ennoble. But the channel through which he can most admirably communicate himself, by a successful use of his special aptitudes and powers, is the one to which he should boldly commit himself, and esteem as the course which will most effectually conduct him to highest welfare. Working thus in alliance and companionship with Nature, he is strong through the virtue of her strength, and is fortified by her invincibility: no honest effort of his can fail; but every stroke which he strikes manfully on the anvil of his fate shall weld his life in closer unison with the life which is divine.

Let a man, then, take counsel of his own soul, and justify his appearance in the world by an austere reliance on his own character. Let him have due assurance that since he is born into the midst of things, and partakes of the breath of his generation, he has not been flung superfluously into time, but that the universe had need of him; since to him also a special work has been assigned,—namely, a new and original life to live. He shall not bend or cringe to any existing institution, or pay needless idolatry to any venerated name, but shall greet with a sovereign independence all accredited establishments and reputations, and by thought and act announce that here is a man who will summon all things to the bar of his own judgment. The pomps and solemnities of history and tradition must not be suffered to hide from him the fact of his inherent significance in the creation, nor shake his sublime conviction that, in every worthy and right endeavour, the Omnipotent effort worketh covertly through his hands. By stationing himself steadfastly upon his manhood, and maintaining inviolate

the citadel of his own mind, he shall draw resources from the wells of Eternal Truth, and all his acts shall be coincident with the primal laws of things. Having come into the universe, he has God's authority to transact his own affairs there, to think his own thoughts, and earnestly to do the work which is appropriate to his faculties. Let him not mar or corrupt his nature by any compliances with foolish customs and conventions; but resolutely abide by his integrity, as one who founds his justification on principles which are rooted in the Everlasting Soul whereby all things are sustained. With a stoical magnanimity let him face the world on his own basis, and scorn to be decorated by any distinction, by any ornament, which does not properly grow out of his character. Truthfulness to one's-self—that disposition and habit of life which permits the soul to shine through all one's sayings and performances—is not alone the first condition of all greatness, but also of every effort whereby any man would successfully raise himself in intelligence and worth.

LONG LOWISFORD.

UPON recovering from a severe illness when I was about sixteen years of age, I was sent for change of air to some relatives whom I had never seen, residing in a distant part of England. Placed under the care of a friend travelling the same route, our journey was performed in the mail-coach, which passed through the town of M—, within seven miles of my destination. Here I was met by a respectable serving-man, and immediately transferred with my luggage to an old-fashioned roomy gig. It was a May evening: in the morning I had left a populous city, and now we were passing onwards through woodlands and pastures, as silent and lonely as the untrodden valleys of the 'far west.' We skirted the side of a swift river, and I was half frightened when we forded it; but the song of birds, the gay wild flowers of the waysides, and all the sights and sounds that met my eye and ear, conspired to lull me into a sort of dreamy consciousness of new life and happiness to come. On attaining the summit of a hill, the domestic, who had not hitherto spoken, pointing to a spire rising amid the greenery of a valley beneath, cheerfully said, 'We be just at home, miss: yonder is Long Lowisford.'

I had seen but little of the country during my brief career; and when we descended to the straggling village—well deserving its name of 'long'—a narrow gushing streamlet flowing throughout its length, with broad flagstones across to reach the houses, the setting sun tinting the gray gables, and playing in a thousand prismatic hues on the latticed windows, whose broad sills displayed many brilliant bouquets, fairy-land unexplored seemed opening to my view. We turned up a coppice lane, and came to a water-mill with dripping slimy wheel; and the foaming waters in the mill-dam quite awed me. We passed an old solemn church, and drew up at the little wicket-gate of the parsonage house, which seemed coeval in age with the church, the porches of both being much alike; that of the sacred edifice being festooned with ivy, and this with roses and chestnuts. I had longed to ask my conductor some questions concerning those with whom I was about to sojourn, but motives of delicacy withheld me from seeking information through this channel. I knew the family consisted of only two members—the Rev. Mr Evelyn and his sister Miss Bridget. I also surmised that they were 'old people,' at least according to my notion of antiquity; and I entertained many private doubts and fears that they might be 'prim and strict;' in short, old people who forget that once they had been young themselves!

But now I was in the hall, with its polished floor of dark oak, and in the arms of the prettiest, sweetest creature I had ever looked on; and yet these terms are applied to a lady past threescore years! I instinctively felt as she addressed me that I was in the presence of a

superior being, and that I must be gentle and good to win her regard, and forget all my wilful rude ways. There was a strange feeling at my heart prompting laughter and tears by turns; and Miss Bridget—for it was she—seeing me weary and emaciated, in a low, soft voice spoke tender words of comfort and encouragement. 'Poor, dear little creature! she is exhausted with her long journey: let us get her to bed, Folliman.' The call for 'Folliman' was answered by the appearance of a tiny, active old dame, many years Miss Bridget's senior, her *ci-devant* nurse, now housekeeper, or whatever she liked to be designated: but how widely different was the aspect of these two ancient women! Miss Bridget was a tall, slight figure, slight to attenuation, but still bearing the stamp of elegance and refinement. Her complexion was so transparently fair and pure, that I know not how I came to guess her age; for there were no wrinkles to betoken it: habitual heavenly calmness had bid defiance to the marks of time. Her silver hair was parted on her brow; but her clear blue eyes could never have been more intelligent and expressive than now. Scrupulous delicacy and neatness characterised her attire at all times; and her extremely beautiful hands and feet seemed more fit for show than use: indeed Miss Bridget's walks never extended beyond the garden; and her slender fingers brought melody from the curiously-carved spinet, the tunes she invoked being rare antiquarian treasures. Yet let it not be supposed that her days passed in useless employments or amusement—no: she presided over the still-room when assisted by Dame Folliman; decoctions and herbal recipes were judiciously manufactured and dispensed to the poor; the doctor of Long Lowisford—happy place, there was *but one*!—jocosely affirming that Miss Bridget Evelyn deprived him of half his patients. Then there was not a poor child in the parish that did not give evidence of Miss Bridget's handiwork in the clothes it wore: and all the little creatures were so neatly attired, their garments composed of small pretty patterns, that strangers remarked what good taste and thrift distinguished the appearance of the Long Lowisford children. There was not a baby born into this world of wo in Miss Bridget's parish whose first robe was not made by her fair hands. This was her sole recreation, except, indeed, the spinet, and those gentle ambulations round the flower garden. She never gathered flowers; and once I remember offering the dear old lady a moss-rose, but gently she put back my hand, saying with a half-stifled sigh, 'No; thank you, dear girl: I never accept and never present flowers.' There was a sadness in her low tone which set me thinking for many a day.—A very different individual in all respects was Dame Folliman from her mistress—a sturdy, wiry, fidgetty old soul—'here, there, and everywhere.' Nearly eighty, but with the activity of eighteen, her bead-like black eyes retained unwonted lustre; and she scolded the maids, and often kept the parsonage in a ferment when 'cleaning fits' were on her.

As to Miss Bridget, Folliman still treated *her* as a girl, chiding her sometimes as a fond nurse does a beloved nursing; still was Miss Bridget beautiful in Folliman's sight, and, according to her account, earth contained not another such angel in woman's form. 'I wonder she has never been married?' said I one day to the busy dame: 'it is very strange, so pretty and good as she is.'

'It would have been *stranger if she had*,' quoth the dame; but not another word could I draw forth.

But there was another individual of whom I have not yet spoken, whose affection for the sweet Bridget, if more silent than nurse's, was as sincere, and far more deep and fervent: this was her brother Mr Evelyn; and the attachment of this brother and sister had something touching and remarkable in it. He was a year or two younger than she, though he looked older, the lines of thought and care having impressed their marks on his thin pale face. He was indeed a grave man, and

rarely lapsed into a smile; but ever bore about with him the conscious dignity of his high calling. Devout meditation was stamped on his fine brow: he was a profound scholar, and a finished gentleman; but though uniformly courteous and benevolent, I never felt at ease in his presence. It seemed as if he could have no sympathies in common with me; and my silly prattle ceased when Mr Evelyn's clear blue eye, so serenely cold, spoke, as I fancied, reproof to all levity. He was a faithful pastor, equally beloved by the poor and rich: to the former he proved a valuable 'friend in need' at all times, while the latter eagerly courted his society and advice.

During that long happy summer I was a continual source of annoyance and anxiety to Miss Bridget; for as health and strength returned, so did hoyden propensities and outrageous spirits: besides, the novelty of a country life excited my wildest delight, and I rushed about more like a young savage than a young lady. Torn frocks scrambling for wild flowers, torn hands plucking them, wet shoes and mudded stockings, were among the least of my mishaps; and had matters been no worse, and rested here, many months of suffering for myself, and anxiety for my kind friends, had been avoided. But despite admonitions and gentle warnings, received with derisive laughter on my part, and an obstinate determination to persevere in a wrong-headed course, I persisted in entering a meadow where a dangerous white bull grazed, to show my 'superiority to cowardice,' as I said. Once too often I ventured; the infuriated animal tossed me to the other side of the hedge, where I was found bleeding and insensible, one leg broken, and a deep gash over my left eyebrow. How tenderly I was nursed by Miss Bridget and Dame Folliman, and how bitterly did I reprove myself! During convalescence I was haunted by a nervous anxiety to hear the worst—to have the *lecture over*, which I knew was deserved, and I thought was in reservation for me. Repentant and humbled, I earnestly desired to obtain the pardon of Mr Evelyn and Miss Bridget; and one evening, when my heart was full, I told Folliman this, for my restless yearnings were unbearable. They had gone to visit some neighbours, and the dame and I were alone together.

'Oh, Folliman!' I exclaimed, 'what must they think of me, so kind and good as they are? When they were young, did they ever do foolish, silly things?'

'I do not think that Miss Bridget ever did a silly thing in her life, much less a sinful one, bless her dear heart!' Nurse spoke with much warmth, placing an emphasis on the words 'Miss Bridget.'

'But Mr Evelyn,' pursued I; 'he seems to be above all the weaknesses of our nature: will he believe my desire to amend, nurse; and that I am heartily ashamed of myself?'

'Set your mind at rest, Miss Anna,' responded Folliman: 'no one can feel for others as master does, because he has known a lifelong repentance for rashness committed in youth. I have had it in my mind to tell you the story when you grew better, because it will be a lesson to you for the remainder of your days: for the memory of your own sickness may pass away with the occasion of it; but when you think of Long Lowisford and dear Miss Bridget, I am sure in future years you will never be violent or headstrong again.' And so saying, Dame Folliman settled herself in an easy-chair preparatory to a long gossip. The substance of her narrative was as follows:—

Forty years ago, a large party were assembled at Dalton Park, the seat of Sir Reginald Dalton, in expectation of passing a joyous Christmas in the true old English style. Among the guests were Mr Evelyn and his nephew and niece, orphans tenderly brought up by that excellent man. Bridget was betrothed to Sir Reginald Dalton's eldest son, and the marriage was to be celebrated during the ensuing spring. There was a large family of Daltons, and only one daughter, a young lady about Miss Bridget's age. The boys were schoolfellows

and companions of Edward Evelyn, whom his uncle destined for the church, always fondly trusting that he would become steadier and less headstrong as he grew older and wiser.

Of a bold, reckless spirit was Edward then, pre-eminently handsome and active, and the leader in every mischievous prank attributed to the Daltons and others. Much concern and anxiety he gave his worthy uncle by his wild ways, for he heeded neither reproof nor warning; he liked to do a thing, or he wanted a thing—that was sufficient—and the selfish impulse must be instantly obeyed. Even his sister Bridget, whom he dearly loved, had no power to check or control his violent spirits; and there was another whose disposition and character were more akin to his own—the darling and only sister of many brothers—the dark-eyed, beautiful Helen Dalton; who, while admiring prowess and superiority in every form, took upon herself to admonish, chide, and rebuke her early playfellow, Edward Evelyn; for was she not his senior by two years? And in right of this seniority must not he receive the lectures thankfully and submissively? Whether Helen's mature age or sparkling orbs claimed dominion, is not certain; but that Edward frequently bowed to her decisions is so; though not unfrequently these high spirits clashed, when their mutual displeasure lasted long enough to make reconciliation sweet. It seemed not altogether improbable that at some future period the bond between the respective families might be cemented by another union besides that of Reginald and Bridget: the two fair girls, though opposite in many respects, were sisters in affection; and the more so, perhaps, because Reginald was dearer to his sister Helen than any of her other brothers. Nor was this partiality altogether inexcusable; for Reginald Dalton combined all those amiable qualities which in domestic life bind and cement endearing love so closely.

Bridget was ever hopeful as to her brother's future career; for he was a generous, warm-hearted fellow, despite his obstinate temper: his brilliant abilities unfortunately rendering steady application to study of secondary importance to him; he achieved, as if by instinct, what others plodded over at a snail's pace.

This Christmas party at Dalton Park, it may be imagined, was a merry one; though one thing the boys earnestly desired, yet which no human means could procure. This one thing wanting to complete their enjoyment was a frost; for there was a fine sheet of water in the park, and if that were but iced over, what splendid skating they could have! Edward was passionately fond of this pastime; and when a sharp frost *did* set in, and the earth was covered with snow, and the miniature lake with the much-wished-for ice, his delight knew no bounds.

'No skating to-day, boys,' said the baronet; 'for the water is deep—awfully deep—and I insist that no foot shall venture to cross it. To-morrow, if the frost continues, we shall see what can be done.'

Sir Reginald Dalton's word was law with his sons; but Edward Evelyn felt chafed and indignant at his peremptory mode of speaking, and he burst into his sister's dressing-room, swelling with indignation, exclaiming—'I shall go on the lake to-day; he is no father of mine; and I won't be dictated to by him! Uncle has gone to S—, and there is nobody to forbid me, and I know the ice is strong enough for skating. Come, dear Biddy, you have your bonnet on; come and see me skate. Ah, what beautiful flowers you have here: I saw Reginald gathering them in the hothouse, and I guessed they were for you!'

'They are to place in my hair at the ball this evening, dear Ned,' said Bridget, archly smiling as she added, 'there are plenty more snowy camelias left, and Helen's jetty braids will set them off to advantage. Will you not present her with some, and leave the skating, dear, for the peaceful employment of flower-gathering?'

'Helen may gather them for herself, if she likes,' pouted Edward: 'she is as dictatorial as her father.'

But I am not going to lose my sport for her whims; so come along, Biddy—I'm off!

'Nay, Edward,' urged the tearful Bridget; 'I am going to walk with Reginald; but I treat you not to go on the treacherous ice to-day: to-morrow, perhaps, you can all enjoy the pastime together, and we ladies will then come and admire your grace and dexterity.'

'A parcel of cowards, Bridget! I wonder you should turn against me too. But go I will, were it only to shame them all!'

'Reginald is no coward,' said Bridget colouring; but she added no more, for remonstrance was unavailing when the evil spirit of obstinacy was uppermost with her brother. He darted from the room, scarcely hearing her last words, but shouting, 'Walk by the lake—I shall be there.'

Bridget rearranged the bouquet which her impetuous brother had displaced; and bending over the perfumed blossoms, she kissed them, half smiling and blushing at her own folly; but they had been gathered by the hand she best loved. She walked with her betrothed to the banks of the lake, in the hope that they might win Edward to leave the dangerous spot: but no; he was on the ice, and cried out exultingly when he saw them. When Reginald found that Edward was determined on disobedience, and would not listen to remonstrance, he moved away with Bridget, feeling as if his prolonged presence tacitly encouraged rebellion to his father's just commands. They left the water, and were entering the woodlands, when a shriek reached their ears—a shriek as of one in extremity. Pausing for an instant only to gaze on Bridget's blanched cheek, Reginald darted back in the direction of the lake, whence the appalling sound proceeded. Bridget followed as quickly as her agitation permitted; she saw an arm and hand appear above the surface of the water; and as Reginald grasped it, her brother struggled for dear life, and regained the solid ice, fainting and helpless. At the same moment the weaker part crashed in with Reginald Dalton's weight, who disappeared beneath it. Frantic screams for aid were unavailing; for aid came quickly, though too late—too late! Reginald had saved Edward's life at the expense of his own; and his affianced bride witnessed the sacrifice. She had indeed cast herself into the water, with the impotent hope of saving that precious life: she was with difficulty rescued; but her lover rose no more!

What words can paint Edward Evelyn's agonies and remorse! His bereaved sister tended him during the months of almost hopeless derangement succeeding the awful catastrophe; she never by look or word reproached or reminded him of the dreadful past, and her patient smile first greeted his recovered perceptions. The years following this fatal event were unmarked by recognition or forgiveness on the part of the Daltons; and Bridget intuitively shrank from obtruding her sorrows on their remembrance, for was not she the sister of that brother whose very name brought anguish to the father's heart? How often she thought of the warm-hearted Helen, her dear and early friend; and Bridget yearned to hear her speak words of forgiveness! Then hope might once more dawn for Edward: for now he was sunk in lethargy, his prospects blighted—his heart seemed turning to stone. Bridget Evelyn knew that her brother's sufferings were far more intense than her own; religion taught her resignation and submission when the first tremendous shock was over; and to her sorrows the poignancy of self-upbraiding was not added. For her alone did Edward live, or wish to live, and by a lifelong repentance and devotion expiate his boyhood's fatal error; and when, in the course of time, the same healing balm came also to his aid, and he began to think of entering on the duties of his sacred calling, this beloved sister, whose self-abnegation was so perfect, sustained him in his resolutions, and cheered and comforted him on his heavy pilgrimage. But yet there was another trial in store; but Edward was better prepared to meet it now. Bridget received a letter from Sir

Reginald Dalton, containing the afflicting tidings of Helen's hopeless state, and summoning her to Dalton Park, at the earnest and last request of the dying. Helen had continued to droop since Reginald had perished so fearfully: there was a deeper sorrow to combat with than even her beloved brother's loss, for Edward also was lost to her for ever. She could not give her hand to him; every feeling of her nature forbade it. But to win her father's forgiveness for him, to accord her own, and to tell him that her affection in death was unchanged—this Helen felt she must accomplish ere she could depart in peace. And she did accomplish it: and she died in Bridget Evelyn's arms, calling her 'sister,' and charging her to bear the message of consolation, forgiveness, and love to Edward.

Need it be added how faithfully this devoted sister performed the bitter task? But while sorrowing for the early dead—his first and last love—Edward Evelyn felt lightened of a heavy burthen, which, as a malediction, had oppressed him. He was forgiven by the earthly father, and would his Heavenly one prove unrelenting?

These details, imparted by Dame Folliman with many tears and discursive comments, coupled with the severe punishment which had befallen myself, afforded a lasting and salutary lesson. It is very rarely that our misdeeds injure only ourselves; and it were well if we early learned to remember how many kinds and degrees of selfishness there are disguised under the names of impulse or rashness. To this day I have a strange feeling when I am offered flowers: my thoughts are carried away instantaneously to that Christmas bouquet of poor Bridget, and my ear thrills again with the sweet sad tones in which she told me that she never gave and never accepted flowers.

THE KING OF DAHOMEY AND THE SLAVE TRADE.

From the kingdom of Dahomey, on the western coast of Africa, the largest and most steady slave-export trade is carried on. To counteract this trade, the British government, as is well known, incurs a large annual expense, and practically fails in its object. Thus disconcerted, our government has made the attempt to persuade the king of Dahomey to abandon the trade in slaves; and the history of this attempt, drawn from a parliamentary paper, we now propose to give. The particulars are contained in a report by B. Cruickshank, Esq. respecting his mission to Dahomey.

The writer of the report begins by glancing at the present state of this nefarious traffic. 'For a period,' says he, 'extending over the last twelve years, the annual exportation of slaves from the territory of the king of Dahomey has averaged nearly 8000. In addition to this number, another thousand at least are annually brought down from the interior, and are kept in slavery in the towns and villages upon the coast, where they enjoy, when well conducted, a very considerable share of liberty, and all the necessities of life in apparent comfort and abundance; but they are subjected to exportation for acts of gross disobedience, as well as for social offences of an aggravated nature.'

'It appears to be a general practice with the masters of the slaves to permit them to prosecute their own affairs, and to receive in exchange for this concession of their time a stipulated monthly sum derived from their labour; owing to this arrangement, an industrious slave is sometimes enabled to acquire his freedom by obtaining funds necessary for the purchase of two slaves, which will generally be accepted as the price of his redemption. This annual supply of 9000 slaves is chiefly, I may say entirely, derived from a systematic

course of slave-hunting; for the number paid to the king by the Mahees and other tributaries, together with the criminal offenders who are exported, forms but a small item in the gross amount.

'The king generally accompanies his army to these slave hunts, which he pursues for two or three months every year. Its miserable objects are weak and detached tribes, inhabiting countries adjacent to his dominions, and at distances from his capital varying from twelve to twenty-four days' march. A battle rarely occurs, and the loss in killed in such expeditions is not so great as is generally believed in England. The ordinary plan is to send out traders to act as spies; these carry their petty merchandise into the interior towns, and make their observations upon their means of defence.

'The trader returns after the lapse of some months, guiding the king's army, and instructing the leaders how they may surround and surprise the unsuspecting inhabitants, who are often thus captured on awakening in the morning. As resistance is punished by death, they generally prefer to yield themselves prisoners, and thus the king's victories are often bloodless. It is only when African kings, of nearly equal power, are ambitious to try their strength, that those wholesale slaughters take place which only terminate in the extermination of a people. Such contests, however, are rare; the African chief having a much greater relish for an easy and unresisting prey, whom he can convert into money, than for the glory of a victory which costs him the lives of his people; so at least it is with the king of Dahomey, who often returns to his capital without the loss of a man either of his own party or that of his enemy. He has on more than one occasion been repulsed by the Akus and the people of Aberkoutah; but in these and similar cases, where the resistance is likely to be strong and determined, his troops are led away before much slaughter has been done.

'After the surrender of a town, the prisoners are presented to the king by their captors, who are rewarded by the payment of cowries, of the value of a couple of dollars for each captive, who is henceforth the king's slave; but on his return to his capital after a successful enterprise, he is in the habit of distributing a number of these unfortunate creatures among his head men, and at the same time bestowing large sums as bounty to his troops. A selection is then made of a portion of the slaves, who are reserved for the king's employment; and the others are sent down to the slave merchant, who not unfrequently has already sold his goods on credit in anticipation of their arrival.

'An export duty of five dollars is paid upon each slave shipped from the king's dominions, even although the port of embarkation may not belong to him. It is a frequent practice to convey them by the lagoon either to the eastward, as Little Popo, or to westward, as Porto Nuovo, neither of which towns are in subjection to the king. He, however, has command of the lagoon leading to these places, and the duty must be paid previous to their embarkation upon it; so that from the export duty alone the king derives an annual sum of 40,000 dollars. But this is not all. The native dealer, who brings his slaves to the merchant, has also to pay duties on each slave at the different custom-house stations on their road to the barracoons. The amount paid at these stations it is more difficult to ascertain, as many of the slaves are the king's own property. A sum, however, of not less than 20,000 dollars may be set down for this item. If we estimate the annual number of slaves sold by the king himself at 3000, and reckon them at the present price of eighty dollars, we have an additional item of 240,000 dollars; thus making in all a revenue of 300,000 dollars derived annually from the slave trade.

'But this calculation, which is a near approximation to the truth, and is under rather than above the exact amount, does not by any means convey a just impression of the advantages which the king derives from the

slave trade. By the laws of his country he inherits the property of his deceased subjects; so that his head men and others who have been amassing property by this traffic, have only been acting as so many factors to the king, who receives at their death the fruits of the labour of a lifetime; a very small portion of the estate, in slaves and cowries, is generally returned to the natural heir, which serves as a species of capital for him to commence in like manner his factorship. Under a system so calculated to induce an apathetic indifference, the king contrives, by repeated marks of royal favour, and by appointments to offices of trust and emolument, to stimulate to industrious exertion the principal men of his kingdom. These appointments, moreover, become hereditary, and their holders form an aristocracy, with sufficient privileges to induce the ambition of entering its ranks.'

In the circumstances here stated, it will not appear surprising that Mr Cruickshank had undertaken an impossibility. On being introduced to the king of Dahomey, and expressing a hope that he would assent to a treaty to extinguish the slave trade on his coast, his majesty was very much at a loss how to reply. He was anxious to conciliate the British government; but on the other hand, the abandonment of the slave trade was pretty nearly equivalent to financial ruin. His majesty's excuses are admirable. 'His chiefs had had long and serious consultations with him upon the subject, and they had come to the conclusion that his government could not be carried on without it. The state which he maintained was great; his army was expensive; the ceremonies and customs to be observed annually, which had been handed down to him from his forefathers, entailed upon him a vast outlay of money. These could not be abolished. The form of his government could not be suddenly changed without causing such a revolution as would deprive him of his throne, and precipitate his kingdom into a state of anarchy. He was very desirous to acquire the friendship of England. He loved and respected the English character, and nothing afforded him such high satisfaction as to see an Englishman in his country, and to do him honour. He himself and his army were ready at all times to fight the Queen's enemies, and to do anything the English government might ask of him, but to give up the slave trade. No other trade was known to his people. Palm-oil, it was true, was now engaging the attention of some of them; but it was a slow method of making money, and brought only a very small amount of duties into his coffers. The planting of coffee and cotton had been suggested to him; but this was slower still. The trees had to grow, and he himself would probably be in his grave before he could reap any benefit from them. And what to do in the meantime? Who would pay his troops, or buy arms and clothing for them? Who would buy dresses for his wives? Who would give him supplies of cowries, of rum, of powder, and of cloth to perform his annual customs? He held his power by an observance of the time-honoured customs of his forefathers; and he would forfeit it, and entail upon himself a life full of shame, and a death full of misery, if he neglected them. It was the slave trade that made him terrible to his enemies, and loved, honoured, and respected by his people. How could he give it up? It had been the ruling principle of action with himself and his subjects from their earliest childhood. Their thoughts, their habits, their discipline, their mode of life, had been formed with reference to this all-engrossing occupation; even the very songs with which the mother stilled her crying infant told of triumph over foes reduced to slavery. Could he, by signing this treaty, change the sentiments of a whole people? It could not be. A long series of years was necessary to bring about such a change. He himself and his people must be made to feel the superior advantages of another traffic in an increase of riches, and of the necessities and luxuries of life, before they could be weaned from this trade. The expenses of the English government

are great; would it suddenly give up the principal source of its revenue without some equivalent provision for defraying its expenses? He could not believe so. No more would he reduce himself to beggary. The sum offered him would not pay his expenses for a week; and even if the English government were willing to give him an annual sum equivalent to his present revenue, he would still have some difficulty in employing the energies of his people in a new direction. Under such circumstances, however, he would consider himself bound to use every exertion to meet the wishes of the English government.

'Such were the arguments which the king used in justification of his refusal to sign the treaty; and much regret did he express that the object which the English government had in view was of such vital importance to him that he could not possibly comply with its request.

'Although inwardly acknowledging the force of his objections, I did not give up the subject without endeavouring to convince him that in the course of a few years, by developing the resources of his rich and beautiful country, he would be able to increase his revenue tenfold; and that the slaves whom he now sold for exportation, if employed in the cultivation of articles of European consumption, would be far more valuable to him than they now were. I endeavoured to make him comprehend this, by informing him of the price of a slave in the Brazils, and asking him if he thought the Brazilian would give such a price for him if he did not find himself more than repaid by his labour? He believed this to be the case; but the length of time required, the whole process of an entirely new system, and want of skill among his people to conduct such operations, appear to him insurmountable difficulties. He was willing, however, to permit Englishmen to form plantations in his country, and to give instructions to his people.

'At last the king appeared anxious to escape from this harassing question; and by way of closing the interview, invited me to accompany him to witness a review of his troops. What principally struck me upon this occasion was the animus displayed by every one present, from the king to the meanest of his people; every word of their mouths, every thought of their hearts, breathed of defiance, of battle, and slavery to their enemies: his principal captains, both male and female, expressed an anxious hope that I would remain in their country to witness their first triumph, and to behold the number of captives they would lead back to Abomey; and that I might be in no doubt that the general mass participated in these sentiments, such an assenting shout rent the air as must have often proclaimed the victory. A quiet smile of proud satisfaction passed across the king's face as he regarded me with a look which said, "these are my warriors;" and when I heard the loud rattle of their arms, and saw the wild sparkle of their delighted eyes, gleaming with strong excitement, as they waved their swords and standards in the air, I fully acknowledged the force of the king's question—"Could he, by signing the treaty, change the sentiments of a whole people?" The sight which I was witnessing was to me a stronger argument than any the king had yet used; here there was no palliating, no softening down, no attempt to conceal their real sentiments under the plea of necessity for undertaking their slave-hunting wars, but a fierce, wild, and natural instinct, speaking in language that could not be misunderstood.

'At no time before my arrival in his country did I ever entertain the faintest hope of his acceding to it in good faith; and since I had ascertained at Whydah the amount of revenue derived from this trade, and had seen the rude and expensive magnificence of his state, I could not but feel that a repetition of my paltry offer of an annual subsidy of 2000 dollars would only clothe me with ridicule. I was anxious, however, to ascertain whether the king really regarded it in a merely

pecuniary point of view, and would forego the trade in slaves upon finding his revenue made up from other sources. He assured me that he would; but even with this assurance, I may be allowed to doubt whether a monarch and a people of such ambitious character would cease from making war upon their neighbours.'

Mr Cruickshank had subsequent conversations with the king of Dahomey on the subject of his mission, but all equally unavailing. Afterwards, De Souza, a person famous in the annals of slave-dealing, tendered a piece of advice which seems far from unreasonable. "Your government wishes to put a stop to the slave trade?" said he. I assented. "Then leave it alone; leave it alone," he repeated; "and believe me, you will disappoint the slave-dealer far more than by the most stringent laws you could form; and in the course of a couple of years you will be much nearer your object than by enforcing the strictest blockade which the whole navy of England could make of the coast of Africa." The source from which this counsel was derived may render it very suspicious in the eyes of some; nevertheless, I am inclined to think that the old gentleman was giving a true opinion upon the subject, and certainly, as being the observation of a man of De Souza's shrewdness and experience, it is worth more than a casual notice. It is a distressing truth that our present blockade is no check whatever to the slave trade: it is flourishing at this moment to such a degree, that the last accounts from Brazil report more than 8000 slaves in the market there without any purchaser; and not long ago a cargo of slaves arrived at the same place, which found such a bad market, that they were given up to pay freight. In presence of such facts as these, and the additional fact, that during the whole period that we have maintained cruisers on the coast, the slave trade has gone on uninterruptedly, we must be convinced of the futility of such a system: it appears to me to serve no other purpose than to increase the horrors of the traffic. In the first place, the certainty of losing a considerable proportion by capture, increases the slave merchants' orders for supply to the slave-hunting African kings, and so renders more frequent and incessant their cruel forays, with their endless tale of miseries from the bloody battlefield, where they were taken prisoners, or from their smoking huts, where they were surprised in sleep, throughout their toilsome journey over the burning plains and through the swampy forests, until their arrival on the sea-shore. In the next place, the precautions necessary to avoid the cruisers oblige the slavers to cram these miserable objects into the stifling holds of small vessels, where it is well known thousands die from suffocation. In addition to this, I believe I may add, that it sometimes happens that the slave merchant has been more fortunate than he calculated upon, and that more of his slaves have escaped capture than he expected; he does not therefore require the additional lot of slaves who have been hunted down for him; so they are left sometimes to starve in the hands of their captors, and sometimes are led forth to gratify them with their tortures. There can be no doubt but that much of this incredible suffering would be avoided if there were no cruisers; and truly, if we cannot alleviate the miseries of these wretches by our blockade, let us not add to their torments by our philanthropic but fruitless exertions.'

De Souza was right. Our attempts to put down the slave trade by armed cruisers is proved to be utterly hopeless, and monstrous on the score of inhumanity, not to speak of expense. Ships cannot repress the slave trade, neither would a line of fortresses on the coast: for in the latter case, the trade would only be diverted into a new channel. Besides, a land blockade would embroil us with the Americans, French, and other nations. In the name of common sense, then, why is the present pernicious and ruinously-expensive policy pursued? If we must have a hand in the thing, why are not more placable means employed? To the consideration of this most important subject the mind of

all reasonable persons ought to be directed. Unreasonable philanthropy, in this as in other things, has done nothing but mischief.

THE MARIGOLD WINDOW.*

THE author of this elegant volume means no doubt to typify his mind by the marigold window of a cathedral, and his thoughts by the light which passes through it, modified by its fantastic, yet little varied forms, and mellowed by its dim poetical colouring. He exaggerates, however, the value of the illumination conveyed through such a medium; forgetting that it can be of little or no utility in bringing out hidden truths, being introduced merely as a constituent part of a picture, the main object of which is effect. Thought, in fact, is not our author's province. He is led by the constitution of his mind to confound sentimental with philosophical reflection, and to imagine he thinks when he only feels and fancies. Even religion he confounds with its forms; ascribing a devout character to the 'tide of munificence and taste now widening throughout the realm,' and tracing it to 'that fountain of revived catholicity welling up within the green seclusion of the Oxford cloisters.' Christianity, to be felt by him, must be objective. He desires to unite the church on earth with the church in heaven by praying for the dead, and believing that the dead pray for him. He sees no inconclusiveness in this means of union: what his nature craves, and must have even in acts of devotion, is a picture for the employment of his heart and imagination.

In one respect this peculiarity is of advantage to the book, although in another it will diminish its chance of popularity. The advantage—and to that we will confine ourselves—is obvious in the excellence of the descriptive pieces. An old house, a ruined church, a dim and mystic wood, were hardly ever more finely painted. You see the shapes of bygone days flitting through deserted rooms; you listen to the swell of the organ vibrating through vaults where the bat is now the only inhabitant; you hear, as of old, the voice of the Lord God among the trees. At this season of the year more especially such a book is welcome. We all of us want to flee away somewhere and be at rest. We care not about the paradox in saying that God made the country, and man the town; but continue panting for that Thing of Beauty which lives in green shades, and on mountain sides, and in old solitary houses; and so we

— 'Rest in hopes

To see wide plains, fair trees, and sunny slopes,
The moon, the eve, the light, the shade, the flowers,
Clear streams, smooth lakes, and overlooking towers.'

These 'overlooking towers' are, after all, the grand charm of the picture, bringing the things of inanimate nature home to our business and bosoms. 'Old mansions!' says our author, 'what a worthy theme of chronicle—what a wealthy mine of romance! That they were monuments of the opulence, the magnificence, and the dominion of our forefathers; that their reverend frontispieces look on us, as it were, from beyond

"The deep backward and abysme of time;"

that their principal connection is with the buried world; and that they hold converse with the living from among the dead—are not considerations to nod and sleep upon, if you be instinct with one spark of that heavenly fire which animates the earthy tenement called flesh and blood.' The heart of an old mansion is the fireplace. 'Undoubtedly the fireside is the Magnus Apollo of

romance, the cradle at once, and the nurse of legendary lore. Look at the superiority of our northern tales over the voluptuous lucubrations of softer and sunnier realms, and you may trace it to the influence of the long winter nights, the heartsome homes, and the hearth-flame—the talkative, the amusing, the ethereal hearth-flame—which at once inspires our fancies and suggests our recreation.

'The soft purple sky jewelled with stars, the paradisaal perfumes from groves of orange and palm, the silver sparkles of the marble fountain soothing the still and tepid air, the gushing cadences of the nightingale, the tall, pillared pavilion, wooing the spirit-like breezes to wander and whisper round its painted galleries, or flit through the gilt lattice of its balconies—all these appliances had much in themselves to divide and distract attention from the story-teller of Italian gardens.

'But when the dark night, early swooping down on the woods and towers of English homes, drove within their gates, and gathered round their firesides, both young and old, high and low, from the stirring excitement of out-door toil or sport; when rain, and sleet, and wind, stalked by door and window, grim warders as they were, and forbade all egress; when the well-spread board had exhausted its gratifications, and the very wine-cup had ceased to charm—then did that domestic fane, the chimney vault, manifest its glories unveiled; then did the feudal focus vindicate philosophy for appropriating its Roman title to express the centre of attraction!'

To give an account of the heterogeneous contents of a volume of prose and poetry like this is out of the question; but as Scotland, for various good reasons, will be the great field of the tourist during the present season, we are happy to be afforded an opportunity of illustrating, and perhaps exhibiting in a new phase, some of its more familiar sights. One of the best triumphs of the railway is the Cheap Excursion, which opens out a world of poetry and romance, intermingled with historical monuments, to eyes that have hitherto been condemned to behold such matters only in the pages of a book. But books, although imperfect in themselves, very often serve as spectacles to enable those to see who would otherwise receive only confused and indistinct impressions; a fact which we may illustrate by selecting a very common object in a very common and cheap excursion. Common and cheap! These words escaped our pen, and it is only on reflection that we are startled to think of the character of the journey we would indicate. The tourist proceeds from Edinburgh to Glasgow—from Glasgow down the course of the Clyde beyond the Gareloch—up the whole length of Loch Long—across the neck of land to Loch Lomond—down Loch Lomond from end to end—overland to Dumbarton—up the narrower part of the Clyde to Glasgow, and back again to Edinburgh: all in one day, and all at the expense of a few shillings! The object on this tour illustrated by our author is the hotel at the head of Loch Long.

'Descending upon Loch Long, we passed the beautiful village and the Hall of Arrochar, once the principal mansion of the chief of the M'Farlane clan, almost sepulchred in huge groves of noble old trees. It was not our original purpose to have tarried in this romantic spot; but in consequence of some defect in the working of the steamboat, we were compelled to land when about half way down the loch, and walked back to the old castle, now used as a hotel, but still in the occupation of the family (how downfallen!) of the M'Farlanes.

'Behold us, then, settled for the night in a wide wainscotted saloon, of carved walnut panels, and to which a steep stair rises direct from the very threshold of the porch—a general air of antiquity hovering over everything, and of course embellished by a thousand visions of the old and warlike clan. The ample hearth sent up a cheerful blaze, most acceptable to this chilly, autumnal night; still there was an aspect of desolation, reminding one powerfully of the Udolpho chambers, with all their

* The Marigold Window; or Pictures of Thought. By the Author of 'Fragments of Italy.' &c. London: Longman. 1849.

accessories of banditti, tyrants, and ghosts. I was to have the haunted room for my dormitory; and fully expected some gigantic chieftain in plaid and kilt to undraw my curtains at the dead of night, and hallo his wild "Loch Sloy!" in my startled ear. My anticipations, however, were not doomed to be realised; for I had a night of deep and refreshing slumber, chimed to by that heavy old clock, whose dim silver dial-plate and spiral frame stands at the head of the great staircase.

'At the first ray of a brilliant October sun I rose, hastily performing my toilet rites, and hurried down to the basking beach of Loch Long. It was a morning of airless frost, cloudless sun, and such serene silence, that the booming of a hundred waterfalls (bournes swollen by the late heavy rains) sweeping down the hills seemed to enhance the repose that enfolded the village, the castle, the church, the woods, and the glass-like sheet of Loch Long in its sleepy spell.

'The old manor castle itself stands on a pleasant point of smooth green turf, commanding the lake: a double row of majestic plane-trees (the customary attendant on the Scottish tower) forms a delightful grove on the south; and the mighty Hill of Arrochar rises abruptly behind the mansion towards the east.

'The house itself is tall, and built in the shape of a T. The most interesting apartment is that which still goes by the name of the Laird's Parlour. It is a lower storey, snug and secluded, wainscotted with fine larch, having the panels highly painted in Dutch landscape, with festoons of fruit and flowers. Among other things, it contains a most curious tea-service of rich porcelain, made in China, expressly for a M'Farlane of his day. Each piece has the M'Farlane arms—argent, a cross in-vecked, saltire, gules, between four roses seeded and barbed proper; the family crest, a sheaf of arrows; the supporters, two Highlanders; the motto, "This I'll defend," and the slogan of the clan, "Loch Sloy," all emblazoned in gorgeous colours.

'As I stood upon the turf behind the interesting building, I actually revelled in the united enchantments of that gray legendary place, and the serene glory of that autumnal morn.

'The venerable house, with its six high gables, towering into large moulded chimneys; its porch surmounted by the wreath that once surrounded the heraldry of the clan M'Farlane; the massy gate itself, clenched with iron studs, the principal stair revealed at the open doorway, and the date of the building, 1697, traced in Arabic figures over the portal, lay all ablaze in the placid splendour of the morning sun; the heavy old trees stood up, green and full, into the azure sky, not a leaf of their variously-coloured foliage tinged by the autumn; and on the mountains beyond the red mineral stains, and the tinges of the dead heather and withering fern displayed their sombre and harmonious colouring.

'What a morning, after a night spent in the gloomy grandeur of a decayed Highland castle!

The Gareloch, which we have incidentally mentioned, is one of the most beautiful bits of water in Scotland. It stretches up from the great bay of Helensburgh, making Roseneath, with its ducal seat, a peninsula, and after leaving the majestic Clyde, assuming all the characteristics of a gentle and solemnly-tranquil inland lake. Here the tourist, who has more time than the flying excursionist, will be tempted to seek out Lady Carrick's Lodge. 'Passing from the sunny shores of the soft Gareloch, through a dismantled gateway, apparently of the early Stuart dynasty, you find yourself all at once plunged among a solemn congregation of trees, whose dimensions are absolutely extravagant, and whose arcades of trunks bewilder you with the luxuriant waste of magnificence, till your astonishment borders upon awe. Yet there is nothing of the gloomy horror of a Druid's grove. The sun sweeps over lawnly glades, that glance in velvet greenness here and there, emblazing sometimes entire ranges of foliage with sheets of lustre, and sometimes with difficulty cleaving through their boughs a pathway of radiance that enlivens even

the gloomiest shadows of their recesses. As to the trees themselves, nothing can exceed the variety of their enchanting foliage (evidently the tasteful work of man's device). The sunny lime, now yellow with its fragrant tassels, the variety of the pine, the cedar of Lebanon, the American oak, the dark and massy sycamore, the aspen, the ash, the chestnut, the walnut, are intermingled with admirable art; while, on a mound apart and elevated, the Twin Titans do, by their prodigious bulk, win you for a space from the noble but inferior stature of their sylvan co-mates. Still so solitary, so silent, so neglected, looks this beautiful spot, that considering the colossal grandeur, its leading characteristic, you might almost imagine it some Eden which the Deluge had spared—some garden planted by the giants of old, men of renown.

'The labour of man, the art and the taste of man are everywhere conspicuous; and yet the only tokens that man selected this sweet place for his abode are two mouldering pillars, a formal avenue (just like a wall) of gigantic lime-trees, leading straight to two tiers of turfy terraces, which were once ascended by stairs, and guarded by balustrades of carved stone, and terminated by a grassy mound, completely over-canopied by ash, birch, and spindle-trees, at once the grave and the monument of the Old Lodge!

'What had its masters done that their habitation should be laid level with the earth, and yet their vast grove suffered to survive, as the witnesses and memorials that the place once so flourishing was now cursed?

'Strange, various, and even contradictory stories are whispered among the rustics. At anyrate it is a lovely, a solemn, a spirit-stirring precinct. I question if I would willingly visit its huge hollows by the ghastly moonlight!

After these splendid trees come the funereal yews, and more especially those of Dirlton Castle, on the southern coast of the Firth of Forth. 'These are the most extraordinary I ever saw. They are of gigantic dimensions, and so thick, as to form profound shades, whose Druidical solemnity a whole forest could not surpass: not frowning here and there in solitary dignity like intruders on the lighter foliage; but glooming in congregated grandeur, the sombre ascendants of the baronial *pleasaunce*, their multitude rendering the other trees insignificant, and their sublimity making the gayest colourings of the orchard look trivial and garish.

'Their vast size is eminently remarkable, where they form the broad and lofty rampires of the bowling-green, rising to the height of fifty feet in some parts, and in others forming solid walls of clipped foliage round the four sides of a square area of considerable size, and the smoothest and greenest turf. This is in a hollow, over which the old castle (one of the most beautiful and interesting ruins in Scotland) rose, when I saw it, high on a basaltic crag, exhibiting a vast assemblage of round, octagon, and square towers, above which the great donjon stood pre-eminent, interspersed with steep coronets of notched gables and chimneys of the most beautiful mould, huddled together in the most picturesque way imaginable; robes of rustling ivy spread their glossy brocade over the greater part, while the ruddy westering sun painted both the majestic edifice and its solemn tapestries with fervent gold. Deciduous trees, richly annealed with a thousand autumnal colours, clustered around the castle; and below them lay the smooth bowling-green, with its long low seats of turf, corresponding with every side, and its arbours in the centre of each. The placid purple of the sky above, the superb pomp of the autumnal foliage, and the profound gloom of the Æthiop yews, their summit just touched by the sunset, at which

"The melancholy mass put on bright looks, and smiled,"

formed altogether a pleasing accompaniment to this October evening, with its breathless atmosphere, dropping leaves, and distant voices from the village green.' The owl follows naturally the congenial yew, with a

lament for the approaching close of his ancient solitary reign. The interior of Dirlton Castle 'is the most intricate, shattered, and piquant thing in the shape of a ruin that ever invited an adventurer of the Radcliffe school. Galleries, staircases, recesses, bowers, halls of vaulted stone, turrets that rise not higher into the golden sky than its vaults sink deep into the pitchy earth, sullen wells, shattered niches, dismantled pillars, and fair and luxuriant trees, waving everywhere in their most finely-moulded chambers. The gorgeous and aromatic gillyflower glows here in lavish splendour. One room is very striking. It occupies the great round south-west tower, and is of course circular, is lighted by three windows, whose recesses, nine feet deep, have each groined ceilings, containing a huge fireplace, with carved columns and moulded cornice, and terminates in a stately alcove ceiling or cupola. The castle abounds in gateways, and there seems to have been court within court, some broad and turf, others tall and narrow as a well. I never saw a Scottish castle so spacious; nor in England one which, with no extraordinary architectural splendour to boast, possesses more attractive features than the basaltic seat, variegated fabric, and antiquated gardens of Dirlton Castle.'

Here is an old town hit off in a paragraph:—'A most romantic air of high antiquity she truly wears—clustering in broad towers and lofty steeples, and girdled by solemn and darkly-globose woods. I do not know when I have seen so striking an effect of architectural old age in a city—not in mitred St Andrews itself. The town stretches the tall and quaintly-gabled mansions of its main street along the southern brow of a steep hill. She then circles round its western ridge, and spreads her houses and gardens down the sides. Gray stone fronts, with blue and red roofs, promiscuously intermingled with tufts of verdure, form a highly-coloured raiment to the mound; and at its top the stately eminences of the High Street, like a mural coronet, spiked with slender shafts, look, glittering in the sun, down on a fertile plain. The dark and arching wrecks of the regal and abbatial buildings—frowning over a wilderness of gorgeous tinted foliage in the blue misty Glen of Pittencrief, close, with melancholy majesty, this solemn, yet splendid picture. Such is high old Dunfermline town!'

Rothsay Castle is sketched as boldly and as rapidly, and Elgin is satisfied with a few master-touches. 'The view of Elgin from the highway on the east is exceedingly impressive. The boldly-vaulted bridge in the foreground, baring its gray face among rich woods of ash and Oriental plane, makes a triumphal arch over the broad, crashing river. And at the back, monstrous in their magnificence, the two great steeples of the minster, with their tall gable and its grand window between them, together with the graceful octagon of the Chapter House, elevate their venerable bulk above the bridge and its green groves. Glooming against the coloured heavens behind them, that fill up each melancholy orifice, their sombre majesty associates well with the heavy gleams of a storm-foreboding sunset, and the thundery purple of those long, bleak hills. The solemn pomp of the principal objects, and the gorgeous colouring over all, together with the awful tranquillity heightened rather than infringed at intervals by the hollow gusts—(the light horse of the approaching tempest)—combined in a superb picture, over which the "lion port" of the gigantic cathedral reigned paramount.'

We can only refer to the description of Loch Leven Castle as being highly characteristic—some will think it amusingly so—of the writer's enthusiasm; but our space will afford nothing more than an abridged sketch of Falkland Palace. This 'is a highly-picturesque fabric, and, from its associations, absolutely fascinating; but if a man goes thither merely for architectural delights, why, then, a great square donjon, with broad turrets and notched gables, a façade of low and heavy structure, with massive cornice and thick cable mouldings, together with the peculiarity of dozens of

medallions between the buttresses, every buttress containing a statue with elaborate canopies and brackets, frowning turrets enringed with noisy jackdaws, and tall chimneys with quaintly-carved coronals, an assemblage of gorgeous but unwieldy decoration—will, it is to be feared, wofully disappoint him.

'The great hall is 100 feet long, and 40 broad, and its roof is redolent of the flattering remains of past royalty, and wretchedly false promises of future immortality. It is painted in ribbed compartments of azure, vermillion, and gold—in scrolls, in shields, in diadems, in mantles, in cyphers, in mottoes. . . . *Fleur de lis*, roses, and thistles, complete the faded decorations of the ceiling; in the centre of which is a large shield containing the arms of Scotland, England, and Ireland; the Red Lion being marshalled *first*, and England quartering France *second* in the escutcheon. I observed the portcullis and crown (the badge of the Tudor family), and the Prince of Wales's plume, with its motto of majestic humility—"Ich Dien." A grand gallery with five colossal windows looking northward extends parallel with this apartment. How like gilded motes in the sunbeam appear its departed companies to the imagination! Nothing but royalty breathes in the murky air: nothing but ermines and coronets break through the dismal arcade: no echoes but of royal command and courtly adulation flit beneath that high and dusky roof! Through the windows you may see the soft hills, sheltered villages, and tinted woods of Strath-Eden; just such a warm sun as this tinged the pale stubbles and green pastures with golden red when kingly eyes saw, but recked not of them. But within the towered palace, *within*—where be the lamps that, with richly-coloured lustre, caused the departed daylight to be forgotten?—where the pictures that made the lovely landscapes of Strath-Eden appear dull and tame?—where the bowered and pillared tapestries which, when men saw, they said, "Would Nature were as fair!"—where the majestic forms that dignified these scenes?—where the lustrous eyes that *deified* them? . . . The most striking feature of Falkland Palace is its cumbrous magnificence of mould: even its commanding towers look low from their bulk. To see the buildings, however, in all their picturesque variety—the roofless and the roofed, turret and hall, staircase and gateway, diamond lattices and gaping windows of rich sculptures, the brocades of barbaric carvings that lace its broad buttresses, and the reverend hue of solemn gray that its huge walls disclose; while birch and pine-trees of gigantic trunks and cluttered foliage are illumined by the calm evening sun-flame that floats upon the pile, and phalanxes of rooks hovering over the trees and towers, whose incessant cries scarcely permitted the shrill note of the martlet, or the deep soft tones of the cushat to be heard—thus to see Falkland Palace, makes desolation pompous, and imparts a glory to gloom.'

At the time and in the place we write, the easier classes are off we know not whither; and in lieu of them the streets are flooded with tourists from far and near, come to admire the objects that have palled upon the others. These new birds of passage are recognised by the healthy brown of their complexions, and by their apparel a little wild and uncitizish; but more especially by the guide-book which they carry, like an official baton, in their hand. An English tourist always goes to work in a business-like manner. His pleasure is occupation. He is careful of matters of fact, and checks his book just as he does his hotel bill. Indeed we think there is 'something too much of this; for in watching details, he may forget impressions, and for the sake of a cold correctness in things of little moment, sacrifice much both of the enjoyment and advantage of the journey. To such travellers, but more especially to the cheap excursionists, who have not time for details, a work like the one we are noticing is wholesome reading. It gives the moral colouring of the object, and informs with spirit what would otherwise be only inert matter.

Although it may be wise, therefore, to employ sometimes the telescope and sometimes the rule, it is equally so to take a broad sweeping glance at the scene through some such medium as the 'Marigold Window.'

A LORD-KEEPER AND HIS MATRIMONIAL ADVENTURES.

If we wish to measure the true baseness of a debased state of morals, it may perhaps be better done, not by exaggerated accounts, and not even by selecting extreme instances, but by observing what those who are brought up in this evil moral atmosphere count as virtues. So perhaps the true wretchedness of the worst inn is not to be tested so well by the misery of its worst room, as by the tawdry finery of its best. Most people are made familiar with the vicious excesses of the courtiers of the Restoration—with the wild libertinism of Villiers and Wilmot—with the anecdotes of the easy, good-natured, and good-for-nothing king and his ministers; 'mad,' as Pepys tells us, 'with the chasing of a poor moth' in the saloon of the abandoned Lady Castlemain when Van Tromp's cannon were heard booming up the Thames. The schoolboy reads with a little wonder how the Lord-Chancellor Jeffries caught a cold, which produced a fever, from his imprudence—participated by another cabinet minister who joined him—in climbing a lamp-post to drink the king's health, when both were stark naked, and had of course drunk more than was conducive to their own health. About such details there is a certain rude and vulgar breadth, which, even when they are true, makes them look like exaggeration; and for a truer and more delicate measure of the morality and principle of that age, we have sometimes had recourse to the pages of those who profess to describe the virtuous men of the court.

In this view, the Honourable Roger North's lives of his three brothers—Lord Guildford, Sir Dudley North, and Dr John North—are a mine of minute and precious veins. They were published in two quarto volumes in 1740 and 1742. They were subsequently reprinted, rather for the use of the curious in historical literature than for the world at large, in 1826. The phoenix among these brothers was Francis, who became Lord-Keeper of the Great Seal. His portrait, as given in his brother's biography, is that of a very handsome man, whose face has a character of judicial grandeur and dignity. At first sight, it seems that of an honest man; and a person who looks at it before reading the book generally thinks so; but before he has finished, as from time to time he looks back at it from the incidents he is reading, he thinks he sees a certain shyness lurking about the well-developed mouth, the full well-fed cheeks, and even the broad lofty brow.

Perhaps the reason why the moral defects of an age are best developed by the eulogistic biographies, is because the biographer, who thinks all is perfect in the object of his inquiries, introduces us to all his weaknesses, which are the intricate and minute parts of character; while the person who records the vices of his neighbour only sees and describes whatsoever is flagrant. For instance, in an account of a man's vices, written by an enemy, or a person judging him harshly, we would never find an instance of sycophancy like the following, told in such a manner as to secure belief:—The young barrister courts a miserly but powerful man, whom all his more imprudent and more vicious brethren shun. In his brother's words—'He was exceedingly careful to keep fair with the cock of the circuit, and particularly with Sergeant Earl, who had almost a monopoly. The sergeant was a very covetous man; and when none would starve with him in journeys, this young gentleman kept him company.' 'I hope,' says Roger North, the writer of these biographies, 'to rescue the memories of these distinguished persons from a malevolent intent to oppress them, and for that end bring their names and characters above board, that all people may judge of them as they shall appear to de-

serve.' In this point he shows his readers how the young lawyer curried favour with the judge, flattering his prejudices, and was ready to sacrifice the interest of an honest client whenever he found that, by pushing it, he lost favour with the judge. Thus 'in circuit practice there is need of an exquisite knowledge of the judge's humour, as well as his learning and ability to try causes; and his lordship was a wonderful artist at sucking a judge's tendency to make it serve his turn, and yet never failed to pay the greatest regard and deference to his opinion when he was plainly in the wrong, and when mere contradiction had but made him more positive; and besides, that in so doing, he himself had weakened his own credit with the judge, and thereby been less able to set him right when he was inclined to it.'

But his love passages are at once the most amusing and characteristic of this astute lawyer's commendable proceedings. At the present day, there is doubtless abundance of mercenary matrimony and hard settlement-bargaining; but it is usual to draw a veil over the harsher outlines of this species of traffic. Although this matrimonial slave trade is not counted in the catalogue of vices, yet it is shielded under that homage of hypocrisy which vice is said to pay to virtue; and we do not find it blazoned, as among a man's good deeds, that he drove a hard bargain for a wife, and was tempted by ten per cent. deduction to abandon the object of his proffered affection.

His first adventure may be styled the Romance of the Usurer's Daughter. It was thus:—'There came to him a recommendation of a lady, who was an only daughter of an old usurer in Gray's Inn, supposed to be a good fortune in present, for her father was rich; but after his death, to be worth nobody could tell what. His lordship got a sight of the lady, and did not dislike her; thereupon he made the old man a visit, and a proposal of himself to marry his daughter. There appeared no symptoms of discouragement, but only the old gentleman asked him what estate his father intended to settle upon him for present maintenance, jointure, and provision for children? This was an inauspicious question, for it was plain that the family had not estate enough for a lordship, and none would be to spare for him. Therefore he said to his worship only, "That when he would be pleased to declare what portion he intended to give his daughter, he would write to his father, and make him acquainted with his answer." And so they parted; and his lordship was glad of his escape, and resolved to give that affair a final discharge, and never to come near the terrible old fellow any more. His lordship had at that time a stout heart, and could not digest the being so slighted; as if, in his present state, a profitable profession and future hopes were of no account. If he had had a real estate to settle, he should not have stooped so low as to match with his daughter, and thenceforward despised his alliance.'* Magnanimous Francis North!

The next incident may be called the Widow's Comedy. The astute young barrister had met his match in a young widow, who kept him and several others of his kind in a long suspense, until she at last married—as if for the mere purpose of spiting them all—a person completely out of the circle of her suitors.

'His lordship's next affair,' says his partial brother, 'was in all respects better grounded; but, against all sense, reason, and obligation, proved unsuccessful. When Mr Edward Palmer, his lordship's most intimate and dear friend, died, he left a flourishing widow, and very rich. The attorney-general and all his family had projected a match of their cousin North with this lady, who were no strangers to each other; nor was there wanting sufficient advices, or rather importunities, of the whole family for her to accept him, against which she did not seem to reluct, but held herself very reserved. In the meantime his lordship was excited to

* *Lives of the Norths*, i. 156-7.

make his application, which he had never done, or, at least, not persisted so long as he did, but out of respect and compliance with the sense of that worthy family, which continually encouraged him to proceed. Never was lady more closely besieged with wooers. As many as five younger brothers sat down before her at one time; and she held them in hand, as they say, giving no definitive answer to any one of them till she cut the thread; and after a clamorous proceeding, and match with a jolly knight of a good estate, she dropped them all at once, and so did herself and them justice.

'There were,' says the partial biographer, 'many comical passages in this wooing, which his lordship, without much pleasantry, used to remember; and however fit for a stage, would not muster well in a historical relation.' He mentions, too, that nothing but the desire of keeping well with an influential family 'could have held him in harness so long; for it was very grievous to him that had his thoughts upon his client's concerns, which came in thick upon him, to be held in a course of bo-peep play with a crafty widow.' Yet the most truly commercial adventure was the third, which is described thus by the affectionate brother:—'Another proposition came to his lordship by a city broker, from Sir John Lawrence, who had many daughters, and those reputed beauties; and the fortune was to be L.6000. His lordship went and dined with the alderman, and liked the lady, who, as the way is, was dressed out for a muster. And coming to treat, the portion shrunk to L.5000; and upon that his lordship parted, and was not gone far before Mr Broker (following) came to him and said, "Sir John would give L.500 more at the birth of the first child;" but that would not do, for his lordship hated such screwing. Not long after this despatch his lordship was made solicitor-general, and then the broker came again with news that Sir John would give L.10,000. "No," his lordship said; "after such usage, he would not proceed if he might have L.20,000." So ended that affair, and his lordship's mind was once more settled in tranquillity.'

'It is said that marriages are made in heaven,' is the next remark of the biographer—a singular one certainly to follow such mercenary doings. It refers to the ultimate matrimonial fate of the Lord-Keeper, who married a woman not only of birth and fortune, but of such affection and amiability, as his hard selfish nature did not deserve. Lord Campbell, in his 'Lives of the Chancellors,' says of North that 'he had as much law as he could contain.' And it certainly seems to have filled him so completely, as to exclude every generous feeling and refined sentiment.

FREDERIKA BREMER AND HER COMPEERS.

THE vigorous and poetic mind of Scandinavia was, until a few years ago, a sealed book to our literary world in England. The very names of its popular authors were unknown among us; and had it not been for the charming life-pictures of Frederika Bremer, this ignorance might haply have prevailed even to the present hour. Her tale of 'The Neighbours,' on its first appearance in an English dress, was hailed with universal delight, not merely on account of its freshness and originality, but also as making us acquainted with domestic life under an aspect which had heretofore been comparatively unknown to us. This enthusiasm concerning Miss Bremer's writings has not yet abated, so that each of her works, on its publication in England, is instantaneously sought after and devoured by persons of all ages and of all shades of opinion.

Frederika Bremer has had the good fortune not only to win popularity and esteem for herself, but also to create a general interest in behalf of the literature of her native country, so that translated copies of Swedish poets and historians now obtain a place on the shelves of our public as well as our private libraries and are

inquired for with avidity by the ordinary class of intelligent readers.

Some slight notice of this accomplished writer, as well as of one or two of her literary countrywomen, may not be unacceptable to our readers. But before speaking of them, we must premise that it is no new thing for Swedish women to indulge a taste for literary composition. So early as the reign of Gustavus III., Hedwig Charlotte Nordenflycht was so renowned for her poetic talent, that she was sometimes named Urania, sometimes Sappho, by her admiring countrymen. And, in truth, her poetry possessed fully as much merit as any that has been transmitted to us by her contemporaries of the other sex.

It was, however, only in our present century that the real life of female authorship began in Sweden.

Far above all others stands Julia Christina Nyberg, better known in her own country by the name of Euphrosyne. Her lyrical productions are full of womanly grace and purity, and evidently spring forth from a heart which breathes the deepest and truest feeling. Her *Legend of St Christopher*, which is to be found in Atterborn's 'Almanac of the Muses' for 1822, may be ranked among the best specimens of Swedish poetry. We cannot speak quite so favourably of the tones which Dorothea Dunkel, Anna Lengren, and Eleonora Alsedyll have drawn from their lyres; neither do we admire the romances of Charlotte Berger (born Gräfinn Cronhielm), who walks forth in the field of fiction on those gigantic stilts of pathos which are but too fashionable at present among the novel-writers of a neighbouring country. But instead of lingering among the authoresses who are less pleasing to our taste, we will turn to the trefoil of talent formed by the Ladies Bremer, Flygare, and Knorring, who have shared among them the delineation of quiet citizen-life, of lively village scenes, and of the more glittering world of drawing-room society.

Frederika Bremer was born in the year 1802. After the death of her father, she inhabited Stockholm for a while, and afterwards spent some time with a friend in Norway. She now dwells with her mother and sister close to the northern gate of Stockholm, passing her summers at a neighbouring estate called Arsta. It is said that she has portrayed her parent in the venerable and singular lady who occupies the foreground in her recent tale entitled 'The Midnight Sun,' wherein also her fair younger sister is beautifully sketched as the suffering yet lovely 'Innerness.' This sister is watched over by Miss Bremer like some fragile plant, which needs all the sunshine of life to make it bloom in freshness and beauty; and it is from the outpouring of her own unselfish heart that Frederika Bremer has given such living pictures of sisterly love and care.

It would be idle to speak here of her works, for they are in everybody's hands; and the merits of her principal personages are discussed with as much freedom in society as if they were our next-door neighbours, or our intimate acquaintances. But our readers will like to know what sort of being in her outer aspect is the lady who has given us such charming pictures of other women. That one who has already passed the boundary-line of middle age should long since have lost the freshness of youth, is self-evident to all; but we wish it were allowed us to add, that some traces of loveliness were still visible about her person, for we are conscious of an instinctive disappointment when the whole human being is not at harmony with itself, when a lofty intellect and a pure imagination are not embodied in a fair and noble exterior. Miss Bremer, however, is decidedly plain. Her spare, fallow features are, however, lighted up by a look full of intelligence and sweetness, and her meagre form is set off by the neat simplicity of her attire. There is perhaps somewhat of the teacher in her aspect—a certain staid and measured glance, which is often perceptible in those who are accustomed to watch over and to check the waywardness of youth. Yet this sort of formality does not destroy the intellectual kindliness

of her countenance. She is quite aware of her own unattractiveness, and has therefore always positively refused to have her likeness taken. The picture of her which is in circulation is only an imaginary one, invented by a German painter for the profit of some bookselling speculation. It was humorously reported last year in a Swedish newspaper that the Americans had just despatched a celebrated portrait-painter to Rome and Stockholm for the express purpose of taking likenesses of 'the Pope and the Bremer.'

In Sweden, her tale of 'Home' is preferred far above any of her other works. It is allowed, even by her greatest admirers, that while the authoress views with a poetic eye the narrow and tranquil course of domestic life, and therefore sheds a tender glow around its scenes, she fails altogether in the gift of bold conception. Her female sketches are drawn with truth and spirit; but when she attempts to portray a manly character, her imagination pictures forth only some disjointed fragments, abounding in mistakes and improbabilities. Her philosophy is also somewhat too transcendental for the fiction of every-day life; and it is perhaps too frequently intruded on the attention of her readers. But fault-finding is an ungrateful task when there is so much to admire and to approve of as in the works of Frederika Bremer.

Emilie Flygare has not yet passed very far beyond the bounds of her thirtieth year. She is the daughter of a country pastor, and need only have recourse to her own early recollections when she wishes to depict the joys and sorrows of a village life. This is consequently her forte; and her work entitled 'Kyrkoinvigningen' ('The Church Consecration') enjoys great popularity in Sweden. Early in life she was united to an officer, and after his premature death, entered into more than one engagement of marriage, which, being broken off, occasioned unkind observations in the Swedish world of gossip and fashion. At length she gave her hand to Carlén, a very mediocre poet, many years younger than herself; and since this event, she has, according to the fashion of some celebrated women of the day, assumed the double surname of Flygare-Carlén. She resides with her husband in Stockholm, and seems very happy in domestic life. She is fully as expert a housewife as a story-teller, and is not ashamed of assisting occasionally in the cooking of her domestic repasts. Above all, she is very modest in her desire for praise, and seems heartily to esteem those who may be considered her rivals in literary fame. She has a slight active figure, and repose is by no means her favourite element. Her small features are rather pleasing than pretty; but a spiritual expression is imparted to them by the soft lustre of her clear dark eyes.

We must now say a word of the Baroness Knorring, who is a right noble lady, and dwells far from Stockholm with her husband, a man of family and fortune. Her age is not very far from forty; and it is said by those who know her well that her life has been one of deep and passionate emotion; that she may say emphatically with Wallenstein's Thekla—

'Ich habe gelebt und geliebt.'

'I have lived and loved.'

She is of a nervous temperament, and of very fragile health; and this, perhaps, is the sort of constitution most fitting to one who describes the weak, sensitive, *sating* emotions of aristocratic life. Her style is light and graceful, and she is an admirable painter of *high life*, with all its elegant nothingnesses and its spiritless pomp. Her best novel is 'Cousinerna' ('The Cousins'), which, like the popular works of Bremer and Flygare, has been translated into German; but we do not believe it has yet appeared in an English dress.

So much for the three most popular romance writers of the present day in Sweden. We shall only add, that there is no country in which literature is held in higher honour than among our northern neighbours. It suffices for a man to have written a volume of interesting tales,

or of tolerable poetry, to be received and courted in the best society; neither is this thirst for learning confined to the more educated classes; for as one traverses the country, either in lake-steamers or by other conveyances, everywhere he is struck by the intense earnestness with which the poorest people are seen poring over some old and oftentimes worn-out volume, as if they were seeking for some hidden treasure. Perhaps they have learned intuitively the truth of Lord Bacon's celebrated aphorism, that 'knowledge is power.' May they also be taught the kindred but still higher truth, that 'wisdom is strength!'

AUSTRALIAN WINE MANUFACTURE.

For some years a considerable effort has been making to render Australia a wine-growing country. Vines of various kinds have been introduced from France, Italy, Germany, and other countries; their culture has been anxiously studied, and their produce made the subject of numerous experiments, all with the view of securing a new and profitable article of export.

The soil and climate of New South Wales being, we believe, especially suitable for vine culture, there it has been carried to the greatest extent; and we should infer that, fiscal arrangements permitting, the time is not far distant when clarets, burgundies, hocks, and other light wines, will form an important branch of import from Australia. And certainly, it may be added, if these articles are to be used at all, better buy them from our own countrymen in the colonies than from France, which, notwithstanding all our liberality, purchases from us as little as it possibly can. We should not indeed be surprised to see the French commercial mind brought by and by to its senses by our large import of wines from Australia.

To show what is doing in New South Wales to promote the wine manufacture, we have the satisfaction of referring to the proceedings of the Hunter River Vineyard Association, on the 1st of November last, as detailed in the 'Maitland Mercury.' This association appears to consist of a number of enterprising settlers of some standing, each of whom brings to an annual meeting a few sample bottles of wines produced on his property, and at the same time reads a report of experiments and observations. On the occasion referred to, proceeds the account in the 'Maitland Mercury,' 'Mr Lang of Dunmore produced three samples: a white wine of the make of 1847, a red wine of the same year, and a red hermitage of 1848. The white wine was of thin body and sharp flavour, but without acidity, and a very pleasant wine for a hot summer's day. The red wine was a good sound wine, of fair body and pleasant flavour. The red hermitage was remarkably good for its age, having been only bottled on the 21st September last; it had the hermitage flavour, and although necessarily weak at present, promised to make a fine wine with age.

'Mr Edwin Hickey of Osterley produced three samples: a hock of 1847, a pale burgundy of 1848, and a hock of 1848. The hock of 1847 had almost precisely the same flavour as hocks of different growth formerly produced by Mr Hickey; it had a pleasant quick flavour, and appeared perfectly sound. The burgundy was a very good wine, considering that it was only of this year's make, having the burgundy flavour, considerable strength and body, and so palatable, that it was considered it would become an excellent wine. The hock of 1848 was of course thin, and of slight flavour; but what flavour there was, was similar to that of the first hock.

'Mr Carmichael of Porphyry Point produced eight samples, four of which were tasted—namely, a red wine of 1846, a red wine of 1847, a red wine of 1848, and a white wine of 1848. The red wine of 1846, made from a mixture of black grapes, had rather a sharp flavour, and was somewhat thin, but was a pleasant wine: the red wine of 1847, made from a mixture of red grapes, was of a paler colour, and the flavour rather strong and harsh, although it tasted as if the flavour was not yet fully developed: the red wine of 1848, made from the *franc pineau* grape, was a very good wine for its age, having a good body and fine flavour: the white wine of 1848, made entirely from Shepherd's Riesling grape,

was an excellent wine, although so recently made, sound, of good body, of fine golden colour, and having a full, rich flavour: this was pronounced a really good wine, and a number of questions were asked as to its manufacture, &c. Mr Carmichael said that the wine was made from Shepherd's Riesling alone, and purely from the juice of the grape, the husks being fermented with it: it was made in February 1848, and bottled in September, about one hog-head being made; this was the first produce of those vines which were planted in land ploughed, but not trenched.

Mr King of Irrawang produced two samples: a white wine of 1844, and a red wine of 1836. The white wine was made entirely from Shepherd's Riesling grape: it was a very fine wine, of rich fruity flavour, and a beautiful golden colour. The red wine of 1836, and consequently nearly thirteen years old, was much admired: it was perfectly sound, and had a very fine flavour, but was not equal in our estimation to the red wine of Irrawang produced by Mr King at the last meeting: it had been eleven years in bottle, and had made a considerable deposit on the sides of the bottle, and it was stated that being shaken in carriage had somewhat injured its flavour: the bouquet from this wine was very fine.

Mr Kelman of Kirkton produced one sample: a red hermitage of 1847. This was a fine wine, of great body, sound, and strong; with the hermitage flavour and bouquet of a remarkably deep colour, but quite clear.

Some conversation followed about the different wines produced, but no distinct opinions were elicited. A general feeling of confidence was expressed that wine would soon be an exportable commodity from the colony.

Mr King produced two samples of liqueurs—an orange liqueur and nouveau. The orange was very sweet and palatable, almost syrupy, but was rather fiery in flavour. The nouveau was remarkably good, of beautiful bouquet, and very agreeable flavour, without any fiery taste.

Mr Lang produced a sample of white brandy, which was strong and somewhat fiery when tasted pure, but very pleasant when mixed with cold water.

Mr Kelman produced a sample of white brandy, so strong, that, when tasting it pure, it was difficult to tell the flavour; but when mixed with cold water, it proved of fine and pure flavour.

This closed the exhibition of samples, and a discursive conversation followed. Finally, reports were read. In one of these Mr Carmichael observes, 'I conceive that a half-acre of vines on the alluvial land will produce in two and a-half years from the time of planting three hog-heads of wine of sixty gallons each; in three years and a-half five hog-heads; and will continue to increase in quantity till the half acre will produce five hundred gallons, or perhaps more. I have at this moment in my garden on the alluvial soil about twenty-four rods of vines, or about one-seventh of an acre, which produced last year three and a-half hog-heads of wine. This alluvial land does not so much require trenching as the forest land; indeed it may be dispensed with altogether if the land is twice ploughed, and then a double furrow opened for every row of vines—a spade deep being dug in the furrow when the vines are planted. I have offered to show to these people the whole process of the management of the wine (in which they imagine there is something very abstruse), and to go at any time to examine their vines, to see that their treatment of them is proper. There is,' he adds, 'no cultivation which the settlers in this country could enter on with more convenience and profit to themselves than the vine, because their time for the vintage is not required of them till the end of February, when their harvest and thrashing are all done, and the pruning and cleaning of their vines not till July, when their wheat-sowing is all finished, and they have a month or two of leisure.'

The most lengthy and explanatory report is that of Mr King. We well remember this gentleman thirty-four years ago when he was a shopboy in Edinburgh, and when we employed our winter evenings together in various scientific studies. Having proceeded to New South Wales, he there, from small beginnings, attained eminence in the manufacture of pottery and glass; but in the midst of these professional avocations at Irrawang, it would seem that he has been paying considerable attention to vine culture; and now it falls to our lot to give publicity to his far from uninteresting experiments. Commencing his report by a reference to the sample of red wine, vintage 1836, he says, 'This wine is the pro-

duct of the black pineau grape, a hardy variety, though a shy bearer. Within eighteen months, however, from the time when the cuttings were put into the ground, the grapes were perfected which produced it.

'The vine cuttings were planted at Irrawang, William River, in September 1834, in trenched land, six feet by four apart, were trained to one stake, and pruned to spurs of two eyes. The soil is free and open, being the débris of puddingstone and porphyry. When the fruit was ripe, it was gathered and pressed in February 1836. The juice was fermented along with the skins in an open vat. When the fermentation became less rapid, as indicated by the reduction of the temperature of the decomposing mass, the liquid portion (the wine) was run into a cask, where, after the fermentive process was finished, it was allowed to remain until the yeast formed had subsided. The clear wine was then drawn off, to prevent the precipitated yeast from again mingling with it, and thereby reproducing fermentation. With the same view, and in order to oxidise any remaining leaven, the wine was in the following spring again drawn off, exposed freely to the air, and run into another cask, where, for the sake of allowing the remaining yeast and oxidised leaven to subside, it remained till the winter of 1837, when it was fined and bottled. From that period to the present time the wine has, in its progress to maturity, gradually undergone various chemical changes. It has consequently deposited in the bottle a portion of its tartar and its colour, lost some of the grape sugar, increased in alcohol, and at times given out carbonic acid; all the while it continued to develop more perfume and ethereal odour, and is now more agreeable and mellow to the taste. Altogether, it has thus become a more perfect wine, without yet exhibiting any symptom of its having reached perfection, or rather that ultimate point of maturity at which, in all wines, deterioration must commence. This wine is the produce of the pure juice of the grape, without any addition whatever.

'One of the established laws of nature is, that chemical changes are accelerated with a rapidity proportioned to the temperature of the mass subject to such change; and consequently wine in a warm climate will naturally arrive at maturity sooner than in a colder one. Wine, we well know, is sent from Europe to the East and West Indies, so that the influence of the voyage may facilitate the ripening process, which is generally developed by long keeping. It is found that the wine, after being so carried to the East Indies, is superior to that which had in like manner been carried to the West Indies, simply because the longer voyage exposes the wine more to the influence of an elevated temperature. It has also been found that the same result may be obtained in a much shorter period of time by exposing the wine to a comparatively high artificial temperature—a practice, however, which I conceive to be dangerous and objectionable: and far more so the recommendation, for that purpose, of exposing the wine in bottle to the heat of a baker's oven, given in a French work of recent authority on the subject.

'The sample of wine now produced, having been grown and kept in this colony, must therefore possess its present degree of maturity years earlier than it could have attained the same degree in any of the more temperate wine-growing countries of Europe.

'A practical result to be drawn from the fact, that temperature exerts a powerful influence in modifying chemical decomposition is, that, from the heat of the climate, the wine growers in this colony, particularly in this locality, will find their wine comparatively soon at a given point of maturity, and will thereby be enabled to send it sooner into the hands of the consumer. This also points out the necessity of cool cellars for the preservation of wine in such a climate as this: whereas, in the higher latitudes, where wine is produced in Europe, the prime consideration in the storing of wine is to protect it from the frost.

'There is another law affecting materially the operations of the wine-maker in many stages of his process, from the fermentation of the juice to the disposal of the wine in bottle, to which I beg to call particular attention with reference to the sample of wine now produced. *Chemical action is active also in proportion to the volume of the mass acted on, other conditions being the same.* Hence it follows that wine, in a large mass, will ameliorate more rapidly, and develop its qualities more completely, than in a small one. It ought to be contained, therefore, in large vessels till that effect be produced; it may take only a few months, or it may take a series of years, to bring it to sufficient

maturity. This depends on the original composition of the wine, the heat of the climate, and other modifying causes. On the Rhine, for instance, wine requires the lapse of many years to ripen to maturity; and to facilitate that result by the mere bulk of the mass, it is stored in very large tuns, some of which are estimated to contain hundreds of pipes.

'When the wine has at length been sufficiently so perfected, it is necessary to arrest or retard, if possible, this chemical process, which constitutes the ripening to maturity. For that purpose, in accordance with the law already stated, the mass must be reduced in bulk; and the most convenient mode of accomplishing this is that which is generally adopted—by drawing it off into common bottles, and packing them away in a cool cellar, to remain till the wine shall arrive at perfect maturity; in this state it may remain, according to circumstances, a longer or a shorter period. But wine forms no exception to the universal law. That quality which is common to all dead organic substances—to resolve themselves under ordinary circumstances into their elementary forms, and which, in the case of wine, aids in its formation, will assuredly in time accomplish its destruction. The same chemical decomposition which promoted the progress of the wine to maturity, will in course of time, even in bottle, as certainly cause its deterioration and decay.

'The sample of red wine presented is now nearly thirteen years old. It was kept only a year and a-half in cask, and has therefore now been nearly eleven years in bottle. Had it been some years longer in the cask, it would no doubt, therefore, have acquired its present degree of maturity in the bottle several years ago.'

Such may be said to be the rudimental state of a manufacture which will soon come prominently into notice in England.

OCEAN PENNY-POSTAGE.

[A newspaper paragraph with the above heading, which appeared in No. 280 of this Journal, has elicited the following remarks from a correspondent.]

THE expense of conveying foreign letters by mail-contract packets to and from this country at the present time is about £640,000 a year. The income arising, however, from packet postage falls considerably short of this sum, and it is probable that no alteration of the present foreign rates of postage would cause the income to equal the expenditure. The object, however, of the government in paying large sums of money to private steam-packet companies for the conveyance of letters, is not only to facilitate commerce, and contribute to public convenience, but to be enabled to convert such packets into war steamers in case of need, and to obtain a knowledge of the proceedings of foreign nations, particularly the movements of their ships of war, which could not be ascertained so cheaply by any other means.

The English mail-packets run to and from this country and France, Hamburg, Holland, Belgium, North America, Mexico, India, China, the Peninsula, Mediterranean, Brazils, West Indies, and the south-western coast of America. The sea postage on letters conveyed by these vessels varies from 8d. to 2s. 7d. To foreign countries the amount of postage is proportioned to the distance of any particular part, and the quantity of correspondence conveyed to it. It sometimes happens, therefore, that the packet-postage on letters conveyed a short voyage is greater than on those conveyed a longer distance. Thus the sea postage on a letter to Spain, the international correspondence being limited, is 2s. 2d.; while to America, four times the distance, where the correspondence is immense, it is only 1s. To every portion of the British dominions abroad, however (except Heligoland), the sea postage is 1s. This is the packet rate for conveying a letter to Gibraltar, a distance of about 1400 miles, and to Hong-Kong, a distance of above 11,000 miles.

The only important parts of the British dominions abroad to which there are no mail-packets are the Cape of Good Hope, Australia, Van Diemen's Land, and New Zealand. The correspondence to those parts is conveyed by merchant ships. The ocean postage on every letter

conveyed by merchantmen is 8d. Out of this sum a gratuity of twopence is paid to the captain of the ship. It will be thus seen that on every letter conveyed to and from the places where the poorest and principal portion of our emigrants resort, the government derives a profit of 6d. The captains of merchant ships are compelled by law to convey letters for the ports to which they are bound, and to deliver them without delay when they arrive. The gratuities paid them are of no value to the shipowner, either in regulating his captain's salary, or in calculating the profits of his ship; because they form so precarious an item, and because also they can only be paid personally to the captain. They are therefore considered merely as a perquisite of the latter.

Now it has been suggested that the government should forego deriving a profit of 6d. on every emigrant's letter; and that, in consideration of the protection from insult and aggression which it affords to the merchant navy, it should compel the master of a merchant vessel to carry letters without receiving gratuities; and that the postage on a private ship-letter to and from any part of the world should be 1d. only. Such an arrangement would scarcely diminish the ocean postage derived from the mail steamers; because, travelling as they do with greater speed and regularity than merchant vessels, they would still convey the letters of the wealthier classes, and all kinds of commercial correspondence.

To all poor persons abroad, and particularly sailors in the merchant navy having relatives at home, the arrangement which has been suggested would be a great benefit. To the poor emigrant in South Africa or in Australia it would prove an unspeakable blessing. The universal complaint amongst emigrants and their friends is the failure of their correspondence in reaching its destination. This is caused principally by defective post-office arrangements in the interior of colonies, and to loss of ships and accidents at sea. But if the postage on ship-letters were reduced to one penny, a dozen letters would be written by the emigrant and his friends where only one is at present—some of which would be sure to arrive safely. At present, the settler in Australia is unwilling to burthen his friends unnecessarily with a tax of 8d.; he therefore writes his solitary letter, and must wait at least a twelvemonth before he can ascertain if it has reached home. If it fail in doing so, it is nearly two years before his relatives can tell whether he is living or dead.

All persons who have had to do with the emigration movement can bear testimony to the anxiety and suspense endured by the relatives of emigrants on account of the limited correspondence that is received from our distant colonies, and which arises entirely from expensive sea postage; and to the unbounded delight felt by the colonist at receiving at intervals, few and far between, a letter from the mother country. It will be utterly useless to organise an extensive emigration movement suited to the exigencies of this country until the postage on ship-letters is reduced. Emigrants and friends part with no expectation that they will ever meet again in this world; and the only consolation that can be offered them is, that they will be sure to frequently hear of one another's existence and welfare.

IMPORTANCE OF AMUSEMENT.

The whole world is distracted with factions; and therefore sure the old time was much to be commended, in tolerating, or rather giving occasion to, some country May-games, or sports, as dancing, piping, pageants, all which did serve to assuage the cruelty of man's nature, that, giving him some little ease and recreation, they might withhold him from worse attempts, and so preserve amity between men. Upon the abolishing of these you could not conceive in reason, were it not that we find it true by experience (for sometimes things which are small in the consideration are great in the practice), what dissolute and riotous courses, what unlawful games, what drunkenness, what envy, hatred, malice, and quarrelling have succeeded in lieu

of these harmless sports! And these are the fruits which our strict professors have brought into the world! I know not how they may boast of their faith (for indeed they are pure professors!), but sure I am they have banished all charity.—*Goodman's Fall of Man.*

CINDERELLA.

BY MRS ORLEBAR.*

WE extract a few stanzas from a metrical version of the story of Cinderella, distinguished by much feminine grace and elegance. Cinderella (the name so corrupted from Ella) is beautifully womanish, whether drudging for her harsh sisters, or fluttering through the prince's ball. Here is her second appearance at the ball:—

'Soon has the monarch hailed his guest
With gracious smile and greeting bland;
And now the prince his suit has pressed,
And won for every dance her hand.
High 'neath the gorgeous dome are swelling
The tones of music; taste and art
In many a rich disguise are telling
How ladies change at will their part.

But, like the spark of varying light
In those pale opals round her hair,
And like the floating robe of white
That caught all hues enkindled there;
Herself the same, to each she seemed
A vision of that brightest thing
He e'er had mourned on earth, or deemed
Might spread o'er life an angel's wing.

The mother thought her like her child,
All beauteous, hurried to the tomb—
On her the aged chieftain smiled,
And saw his wife in virgin bloom.
Prince Edred's thoughts enchanted trace
His boyhood's dream in Ella's eyes,
And mark each shade of woman's grace,
His manlier soul has learnt to prize.

That night in many a mirror tall,
The sisters oft their dress surveyed—
Admiring glances on them fall
For well was Ella's skill displayed.
But now, while all around them float
The stateliest forms of pomp and pride,
With jealous pang again they note
The lovely stranger by their side.

Still near the baron would she come,
And win for him the prince's smile;
Then speak to Sybil of her home,
With playful art and gentle wile:
Who that had seen her waiting last,
A handmaid at her haughty call,
Shrinking from anger's blighting blast,
Had known the Beauty of the Ball?

The close of these entertainments, our readers are aware, is always abrupt for the fairy-decked lady:—

'She sang, and while Prince Edred heard,
He felt as though a finer sense
Of music's power within him stirred,
In soul-awaking eloquence:
For she had caught all natural tones
That swell our English woods among;
Her voice was soft as the last low moans
Of the storm, and clear as the blackbird's song.

She ceased, but terror blanched her cheek,
The clock slow echoed to her lay;
And like some form that might not speak,
Through wondering crowds she fled away—
She gained her car, the train was nigh,
The pages on their queen attend;
How rapidly—how silently
Their homeward way they wend!

Yet ere she reached the garden gate,
Her hair unbound—the dress she wore
Ill matched her slippers, glancing late
Like sunbeams on the palace floor:
Back creep the lizards to their hole—
Gourd, bulrush, poppy, withering fall;
And home the frightened maiden stole,
To wait within that gloomy hall.'

* London: Masters.

When she follows her sisters to another fête, she is the expected star of the evening:—

'They went: but 'neath the palace dome
Was all prepared for one alone.
Her time of triumph now was come,
And bright the crystal slippers shone.
The love within her bosom shrined,
Had moulded with its plastic power
The form that answered to the mind,
Like music, played in passion's hour.

Her girdle flashed with gems of light
Brought by some gnome from Eastern mine;
One wild rose decked her royal knight,
Worn where his star was wont to shine.
The ball-room seemed a fairy scene
Enchanted by a lover's spell:
A thousand lamps, green leaves between,
Glowed round the motto, "*Tout pour Elle.*"

* * * *

Yet on her voice Prince Edred hung
As though no royal suitor he.
She starts, for through the vines has rung
A peal of fairy melody!
"Oh stay me not—my hour is gone!"
From hall to hall fear wings her flight,
The prince bewildered follows on:
Has Ella vanished in the night?

She dropt one slipper as she ran,
He did but stoop to win the prize;
Of all the courtiers not a man
Can tell where last she met his eyes.
"Ho, guards!—ho, idlers round the gates!
Which way has gone the Fairy Queen?"
No lady passed—no chariot waits—
No trace of all the train is seen.

"A girl ran by in russet weed;"
"Here shone the car;" "A page stood there;"
"This bulrush lies where pranced his steed!"
"Tush," said the prince, "such tales forbear."
Well was it that some pitying fay
Led Ella to her father's home,
Or never had she tracked the way
That late so radiant she had come.'

The lost slipper, as in the original, is the means of identifying the radiant creature of the ball with the slave of the two tyrannical sisters; and a very charming little poem ends with the triumph of love, meekness, family affection, and generosity—the feminine virtues.

THE EFFECT OF CHARCOAL ON FLOWERS.

About a year ago I made a bargain for a rose-bush of magnificent growth and full of buds. I waited for them to blow, and expected roses worthy of such a noble plant, and of the praises bestowed upon it by the vender. At length, when it bloomed, all my hopes were blasted. The flowers were of a faded colour, and I discovered that I had only a middling multiflora, stale-coloured enough. I therefore resolved to sacrifice it to some experiments which I had in view. My attention had been captivated with the effects of charcoal, as stated in some English publications. I then covered the earth in the pot in which my rose-bush was about half an inch deep with pulverised charcoal! Some days after I was astonished to see the roses, which bloomed, of as fine a lively rose colour as I could wish! I determined to repeat the experiment; and therefore, when the rose-bush had done flowering, I took off the charcoal, and put fresh earth about the roots. You may conceive that I waited for the next spring impatiently to see the result of this experiment. When it bloomed, the roses were, as at first, pale and discoloured; but by applying the charcoal as before, the roses soon resumed their rosy red colour. I tried the powdered charcoal likewise in large quantities upon my petunias, and found that both the white and the violet flowers were equally sensible to its action. It always gave great vigour to the red or violet colours of the flowers, and the white petunias became veined with red or violet tints; the violets became covered with irregular spots of a bluish or almost black tint. Many persons who admired them thought that they were new varieties from the seed. Yellow flowers are, as I have proved, insensible to the influence of the charcoal.—*Paris Horticultural Review.*

MOONSHINE.

THE moon is something more than what astronomers tell us. Poets and sentimentalists of all classes have respectively their own ideas on the subject. Physically speaking, there may not be much in a 'matter of moonshine;' but there is a wide world beyond the sway of the five senses. Beauty, poetry, romance, belong to the spiritual realm, in which the soul sits supreme, with Memory and Imagination as her handmaids. Beauty, of itself, and totally irrespective of any other qualities, invests its possessor with a high and fascinating interest. And beautiful, surely, all will allow that orb to be which, rising upon the darkness of night, pours light from a silvery fountain upon earth, and sea, and sky, making lovely the sleep of nature, as the sun makes glorious her awaking.

Our readers have often heard of an Eastern potentate who styles himself Son of the Sun and Moon, but comparatively few have regarded this title otherwise than as a piece of Oriental bombast. Not so, however; and it is not less true than strange, that in China there exists at this moment a race of pagans, equal in number to all the nations of Europe, and superior to some of them in civilisation. The sun is adored by the Chinese as the Great Light, the moon as the Light of Evening. When sacrificing to the former, the imperial high-priest is robed in red; when offering oblations to the latter, in pale vestments; and the whole rites exhibit marks of a thoroughly material worship. We are astonished to think that this worship, whose origin was coeval with that of the Chinese nation, has now endured for more than three thousand years; and its existence among them at the present day is a convincing proof that civilisation alone is insufficient to emancipate the human mind from the blindness of superstition. If such is the case among the educated Chinese, we need not be surprised at finding the moon worshipped by tribes of the Pacific Ocean and of the American continent, among whom the mental vision has been weakened by a long absence from the light. Even among those desperados the Sikhs, a reverence for the lunar orb has not died out. During the late bloody campaign in the Punjab, they monthly saluted the new moon with salvos of artillery; and on one occasion, says an Indian subaltern, when lying opposite our army amid the jungles of Russool, they 'kept blazing away at it the greater part of the night.'

In the heathen world of old, which worshipped the Creator through his visible works, an orb so beautiful and singular as the moon could not fail to elicit adoration. In the Sabian worship—the earliest and purest form of idolatry, which first seduced the star-gazers of Chaldea from the spiritual worship of the Creator—homage to the moon held a chief place. When they

'beheld the moon walking in brightness,' says the afflicted patriarch, 'their hearts were enticed, and their mouth kissed their hand.' In the regions of the south, through whose transparent atmosphere the orbs of heaven glow with exceeding splendour, the worship of the moon was almost universal.

Well did the Greeks make Luna the sister of the god of poetry! Who has not felt that there is romance and tenderness in the moonlight's haze, hanging like a silver veil on rocks and hills, and woods and waters? Modern poets have celebrated its magic power over the heart; and the verse-chronicles of early times are replete with strange fancies concerning it. In those days when the race of man was still young, and fond of the marvellous, the moon was generally considered the mate of the sun, and the female generative principle in nature. Fancy seems in all ages to have given the moon a tenant of some kind or other. Among ourselves the story is, that once on a time a man went into the fields on a Sunday to gather sticks, and that while engaged in this anti-Sabbatical pursuit, he found himself becoming thinner and thinner, till at last he was taken away bodily, and became the Man in the Moon, where he and his bundle of sticks are still to be seen. In a similar fashion the prose Edda informs us that Máni (the moon) carried off from the earth two children named Bill and Hjúki, as they were returning with a bucket of water from the spring called Byrgir; and 'these children,' the Edda adds, 'always follow Máni, as we may easily observe even from the earth.' Above all, in the land of the Greek, where religion, divested of its awe, became a science of the beautiful, the story of the virgin Luna was woven of graceful fancies. Lonely amid the blue fields of heaven, she yet could not escape from the yearnings of human affection. In the silence of night she beheld from the skies the beautiful night-watcher on the Carian Hill; and when she sank behind the woods of Mount Latmos, the Greek deemed that she sought there the embraces of the fair Edmion.

Although there is no heat in the moonbeams, and though their radiance, say astronomers, is between two and three hundred thousand times less bright than the sun's, yet in the regions of the south, a noxious influence is attributed to them, resembling in a faint degree the fatal *coup-de-soleil* (sun-stroke) of the same latitudes. 'The moonlight of Egypt,' says the author of 'Letters from the East,' 'is so bright, that a person can see to read with perfect ease; and the natives will tell you, as I found afterwards they also did in Arabia, always to cover your eyes when you sleep in the open air. The moon here really strikes and affects the sight, when you sleep exposed to it, much more than the sun: indeed the sight of a person who should sleep with his face exposed at night would soon be utterly impaired

or destroyed.' And in Hindoostan, it is well known that meat which has once been exposed to the moonbeams cannot be cured, but will quickly putrify; while meat in precisely the same condition, but which has not been so exposed, will preserve readily. Theoretical opinion must give way before a belief founded on experience so long-existing and so universally prevalent. From the earliest ages to our own times, from the sleepers on the flat roofs of Syria to the night-watch on board a Mediterranean steamer, comes corroboration strong. 'The moon by night shall not smite thee,' said the Psalmist three thousand years ago; and a modern writer relates the following incident as having happened to him when sailing in a Maltese vessel off the northern shores of Africa:—It was a brilliant moonlight night in spring, and, fatigued with heat, he lay down to sleep on the open deck; but soon afterwards he awoke with a feeling of suffocation, and found his cloak drawn closely over his head. He removed the encumbrance, and again went to sleep—again to be awoken from the same cause. The captain (an Englishman) now cautioned him against sleeping with his head and eyes exposed; and on his laughing at what he considered the captain's simplicity, the latter referred him to his sailing-guide, where cases were given in which such exposure had been followed by blindness, and sometimes by mental derangement. Lost wits go to the moon!—at least so ran the fable in the days of Ariosto. And accordingly, when the peerless Roland becomes love-frenzied by the coldness of the fair Angelica, and commits all sorts of monstrosities, even to that of running stark-naked through the fields, it is to the moon's orb that Astolfo rides on his winged steed to recover the senses of his friend.

In harmony with the preceding mixture of fact and fancy, is the common belief in the influence of the moon upon those most unhappy of beings—lunatics!—in whom the god-like intellect is extinguished, and the heart, left alone in darkness, forgets its high mission—whose very name (from *luna*, the moon) is expressive of this belief—and whose 'moon-struck' brains are supposed, like the ever-restless sea, to throb more tumultuously as the orb approaches the full. Oh, moon! how can one so gentle be thus cruel—one so lovely be thus ensnaring? How like art thou to woman! Like to woman in thy beauty, like to woman in thy changes; like to her in thy power over the heart and brain; blessing, yet sometimes blighting, him who would bask in thy beams! But let us not blame thee, nor her to whom we have likened thee. Rather let us learn that there is no influence so benign but it may injure—no worship so heavenly but error may mingle therein. The statue cannot always warm to Pygmalion, and Peril sits by the shrine of the beautiful.

Of the vast influence exerted by the moon over the tides of the ocean nothing need here be said. Only let it be remembered that when we stand on the shore at high water, and see the waves come tumbling in upon the beach, very strange does it seem to us that the wavelet that breaks and dies at our feet was born of the moon in the far south, amid the unbroken solitude of polar seas.

But an influence as mighty and subtle, and more inexplicable still, does the moon exercise in the moral world; and as if in harmony with her rule over the water, so sways she the tides of the human heart. Beneath the silent moonlight all the eye sees is repose; all the ear hears is the murmur of sleeping nature. We seem to breathe a tranquillising atmo-

sphere, under whose genial influence the wave of passion subsides, and bitterness dies away in the heart. When the Ancient Mariner stood alone on the rotting ship, motionless amid a rotting sea—with the fearful spell upon him, and his heart dry as dust, so that he could not pray—the moon rose on his weary vigil. Then yearned he towards her as he saw her journeying through the sky as in her home; and as her light made beautiful the hideous scene around him, and he beheld the creatures of 'the great calm' disporting themselves where never an eye could behold their beauty, the stony heart softened, and he blessed them; and straightway the spell began to break. Coleridge had a warm impulsive heart; and doubtless in that career of sorrows, which to his sensitive spirit seemed at times like life in death, he had often gazed upon the calm pure face of the orb of night, holding on her way, passionless, all unmoved by the turmoil of earth: and with him, too, the spirit has grown tranquil, and the cry of the heart been hushed. A sweet consoler is the moon that looks in through the lattice on the weary and wo-begone, cheering him like the gentle face of woman, and yet saying never a word to remind him that he needs comforting.

Yet there is melancholy in the moonlight. Joy is the offspring of day, and laughter and the glad sunbeams go hand in hand; but merriment beneath the moonbeams jars like a loud laugh from a woman. It is an hour, indeed, when joys from the past come floating into the soul, and the faces of absent loved ones are present to the mind's eye; but all is calm, passionless, as an infant's dream. Festivals there have been beneath the moon, and enjoyments there are; but how different from their kindred of the day! Under the skies of southern night may be heard the tinkle of the lute, pale forms of dancing-girls may flit in the silvery gloom, and the sound of falling waters come on the cool breeze like the music of a dream; but the voice of the fountains only makes stillness more still, and motion brings out the sleep of the moonbeams. Through the vinewoods of Italy of yore youths and maidens strayed in the dazzling moonlight, celebrating the vigils of Venus; but on those balmy May-nights amid the concourse there was solitude, and for shouts of the worshippers only the still small whispers of love.

But for the moonlight we would miss one of the most delicate aspects of our planet, and lose a delicious contrast to the heat and glare of noontide. At midnight it makes a softer day—day, without its business, without its noise—day with lustre enough to beautify, not to make plain. It is an hour when the coverlet of cares and suspicions is lifted off, and the heart awakes, and fancy builds dreams.

'None but the loving and the loved,
Should be awake at this sweet hour,'

says Moore; and all poets are agreed that the moonlight hour is propitious to lovers—dangerously so, adds Byron, who in a well-known passage of his 'Don Juan' comments on its influence in throwing over the heart 'a loving languor that is not repose.' Verily not even the star of eve, the star of love, Venus herself—brightest of the wandering planets, and goddess of the magic twilight—hears so many loving vows exchanged, so many sweet words whispered. Yet 'swear not by the moon—the inconstant moon!' says Juliet, looking from her balcony in the moonlight upon her lover—'lest thy love prove like variable.' But the fair Capulet felt how many dangers threatened their loves; and in her thirst for strong assurances, had Romeo sworn by the unchanging sun itself, she would still have asked for more. 'I will think of my love in the moonlight,' says a simple ditty; and whether the object be the gallant Romeo in the garden of his hereditary foes at Verona, or the 'sailor-boy' on his way to the banks where pearls grow, in the hope of bringing thence a casket for his mistress,

the sentiment will generally find an echo in those who, though one in heart, are

—'Severed far,
As its reflection from the star.'

Straying by the mellow moonlight of autumn—with no voices in the fields, and no sound in the air, save the fitful murmur of the Teviot, borne on the breath of early night—and thinking of one then wandering beneath the southern cross, I have looked to the moon walking in brightness, and my mouth has kissed my hand. Not in adoration to thee, queen of heaven!—but I fancied the eyes of a loved one were then gazing on thee, and, reflected in thy silver mirror, looked down in unforgetting calmness upon mine! Fancy's

'Smile can make a summer,
Where darkness else would be.'

But what is the aspect of this 'silver regent of the night?'—in what bright world would we find ourselves if transported thither? Are those silvery beams raying from a paradise tenanted by happy mortals, or beings more godlike still? When young, we did not ask ourselves such questions, but vague fancies like these filled our brain when gazing upon the bright lamp of night; and all that was sweetest in our dreams of fairyland and elysium we loved to gather round the 'moonlight's home.' The home of the moonlight!—alas! maturer years, that have cruelly dispelled many a sweet vision, have not spared our lunar utopia! At the glance of the telescope, as at the touch of Ithuriel's spear, the glitter of the borrowed sunbeams falls off, and reveals—what? A wilderness of mountains, high as the Himalayas, above; a honeycomb of caverns, deep as the Alps, below. Here and there a circular plain, isolated from the rest of the lunar world by perpendicular walls of rock, which the strong wing of the eagle alone could surmount. A sphere whose hues are the lights and shadows of its tremendous peaks—bare, waterless, almost airless! A ruined world, through whose crust the inner fires have burst in a thousand craters, spreading havoc all around. Now even the craters are extinct; the destroying fires have exhausted themselves. There may be inhabitants; but what a home!

It is night, and the fair orb is now looking in upon me through the slender boughs of the Persian lilac at my window with a calm, sweet smile, as if pleased when an upturned eye thanks her for her light. Oh, moon! lonely amid the blue skies of midnight, with what patient goodness dost thou cover thy scarred bosom with beams, and, forgetful of thine own sorrows, lightest up untiringly thy husband orb, making beautiful his season of darkness, and loving him all the more for the lustre thou givest him! In the wide world round which thou rollest, thou beholdest, of all its myriad creatures, one only like to thee—one only so gentle and self-denying—one only whose love, like thee, shines brightest in the night-season! Good-night, gentle moon—good-night!

THE HONOUR OF HONESTY.

'WHEN shall I get a new bonnet?' doubtfully soliloquised a young serving-girl, who, in a dismal back garret, where a great baby was sleeping, was despondingly considering her head-gear, as she prepared to go out one Saturday evening. She might be excused for reflecting on the subject; for the coarse straw bonnet—which had never been handsome—was now sunburnt and dirty, and with its soiled and faded ribbon, looked hardly neat, though it had been carefully kept. 'I declare I'm almost ashamed to go to church in it, it's so dirty,' she continued, as she turned it round in her hand; 'though maybe it's of a piece with my gown and shawl: but come, they're not dirty neither. I wonder whether mother can spare me my wages this week? Perhaps she can: I know she was sure of work last

Saturday: well, we'll see.' So saying, she tied on the shabby bonnet, and carefully folding up two shillings, which she took from the window ledge, she put them into her pocket; and giving a last glance at her little bed, to see that her baby bedfellow was safely tucked in, she hurried out of the room, and out of the house, away on her weekly visit to her family.

Bessie Abbott was a pretty, pleasant-looking girl of nearly eighteen, strong, active, and industrious. She was the daughter of a worthless man, and an excellent woman. The teaching of the latter had borne good fruit in Bessie, who, though only a drudge in the family of a little shopkeeper, was a neat and excellent servant, as far as her knowledge went; while her integrity and good-temper would have rendered her valuable in any situation. She was in the receipt of what she considered the handsome income of two shillings a week, for which, with board and lodging, she did everything in her employer's house; for its mistress was constantly engaged in the shop, and left the whole care of her five children, as well as all the household work, to 'Pretty Bessie'; and never was burthen laid upon a more willing worker. Bessie's father did little for the support of his household: he spent half his time, and more than half his earnings, in the beer-shop; and the little money left for his wife did hardly more than supply his board: sometimes, indeed, he even demanded food when he had given no means of procuring it. The burthen of the family of course fell wholly on his poor wife, who was a quick and dexterous needlewoman, and who was glad to obtain any species of work by which she might earn a little; for her supply from the tailors, who were her usual employers, was not very regular, and sometimes failed altogether for a time.

Bessie was the eldest of a large family: the two next in age to herself, a boy and girl of fifteen and thirteen, were both well placed, though neither could contribute to the family income; but there were seven still younger, entirely dependent on their poor mother's exertions. Such being the circumstances of the household, we need not wonder that a girl so affectionate as Bessie should have felt very doubtful of the possibility of buying a new bonnet; for, unlike too many in her situation, she never felt that her money was her own if it were needed for her mother's use, and was only happy in the thought that she was enabled to contribute to that mother's comfort; and in this respect her natural feelings were aided by higher principles, implanted by Him who so severely censured the unfilial conduct of the professing Jews.

As Bessie hurried along the streets to her mother's house, which was on the other side of the town, she cast many a wistful glance towards the displays of bonnets and ribbons in the shop windows, and even paused once or twice to bestow particular admiration: nay, she went so far as to decide what shape she would buy, and how it should be trimmed, if she could but get the money for it; and she had strong hope of being able to do this, because she knew her mother had been promised more work than she could accomplish for several weeks to come. At last Bessie reached her home, which was one ill-lighted room, with a dark closet adjoining, in a tumble-down old house, situated in one of the courts of a densely-populated neighbourhood, and tenanted by five or six families besides the Abbotts. It was home, however, and Bessie felt that it was so, as, after running up the tottering stairs, she opened the door of her mother's room, which, if not very comfortable, was at least very clean.

'Oh, Bessie, Bessie!—here is Bessie!' cried a posse of little ones as she entered. 'Here is Bessie come, mother! Come to mother, Bessie; she's crying!' and two of the young things seized their darling sister by her dress, and pulled her forward, as though at her coming their mother's tears must dry.

'What is the matter, mother dear?' cried Bessie, frightened, as she approached a neat, careworn woman, who, with her hands convulsively pressed together, and

silent tears dropping from her eyes, looked absorbed in hopeless distress.

'Bessie, Bessie, what shall we do?' she exclaimed, as her daughter knelt, and threw her arms round her: 'what will become of us?'

'Oh, mother, what is the matter? What has happened?' returned Bessie, her own tears beginning to flow in sympathy and alarm. 'Oh, dear! I thought to find you all so comfortable to-night!'

'Ay, and so we might have been,' answered the mother in a tone of heartbroken despondency—'only for him—for your father, Bessie! How could he do it?'

'Mother, mother, what *has* he done?' exclaimed the terrified girl, all horrible visions of crime starting up before her.

'He has taken away my work, Bessie—my work, that I hoped to get so much for—and he has pawned it for drink—I don't know where; and he beat me like a dog when I begged of him to tell me where it was. And the master wanted it, and I hadn't it for him; and oh he was angry—and no wonder; only it's hard upon me, Bessie. And he says the waistcoats are worth two pounds, and he'll have them, or their worth, if he takes my bed from under me. Then I owe our landlord for a fortnight's rent; for I didn't pay last week, thinking I should be so much better off this. And I haven't a penny in the house for the children's food; they've been nigh famished as it is, for the waistcoats were almost the first work I did. And now where I am to look for money or work I don't know, or how I am ever to pay this dreadful debt: my poor little ones will all be starving about me. How shall I bear it? And then to think who has brought all this upon me. Oh, Bessie, it almost breaks my heart!'

'This is trouble indeed, indeed,' sobbed poor Bessie, as she leant against her mother's shoulder: 'I little thought of finding you like this as I came along. But, mother dear, you mustn't be quite cast down: put your trust in your Heavenly Father, without whose knowledge not a sparrow falleth to the ground.'

'Ay, Bessie dear; but it's hard to put such trust in Him, when nothing but trouble is to be seen. I'm sure I try; but it's very hard, my child.'

'Yes, it is hard, mother; yet who else shall we trust in? And, mother, here are my wages for to-day and to-morrow, and who knows what Monday may bring? Aren't we bid in such times as these to take no thought for the morrow, for sufficient unto the day is the evil thereof?'

Mrs Abbott pressed her child more closely without reply, and those of the children who were old enough to understand what passed, gathered reverently round to listen to Bessie's words, as she continued her attempts to console her mother. Nearly an hour passed in this manner, and at last Bessie's earnest, hopeful persuasions so far prevailed on her mother, as to excite a feeling of trustful resignation; and with lighter heart the girl began the children's Saturday night's ablutions, while her mother went out to make the necessary purchases of food; and when, on the return of the latter, the hungry little ones were regaled with a large piece of bread, trouble seemed for a while forgotten. However, Bessie, when she had, as she expressed it, 'cleaned all up,' was obliged to depart; and after a tearful adieu, she was once more hurrying through the streets, which she had so lately traversed with such different feelings. 'Boast not thyself of to-morrow,' she mused as she reached her abode. 'We may well always remember that: we little thought last week when we were so pleased about the work, what trouble it would bring.'

Sunday morning came, and the sound of pleasant bells; but to Bessie it differed from other mornings only so far as her own thought made a Sabbath around her, for she could not go out until the evening; and she had even more to do on that day than on the other six, especially as her mistress, who rarely attended church herself, was always at hand to find fault. Many were the sad thoughts she bestowed on her mother's troubles

during the day; and when at last she was able to set out for church, under strict injunctions to return immediately on the close of the service, she was depressed in spirits more than she had ever before felt in her life.

The service came to a close, and Bessie in a quiet mind left the church, and slowly and thoughtfully walked homewards. She was one of the last who came out; and as she walked across the wide churchyard to the least-frequented gate, she struck her foot against something, which yielded to her step, and returned a rattling sound. She stooped to pick up the object, and it proved a well-filled purse; the bright beads and tassels glittered in the half light of an autumn evening, and its weight and rotundity showed it well supplied. Bessie stood positively breathless for a moment in the excess of her joy; she felt a dizzy rush in her head, and for a moment all surrounding objects seemed to swim before her; then clasping her hands in a mute aspiration of thankfulness, she recovered full possession of her faculties, and began to examine the treasure.

'One, two, three, four, five, six, seven!' she counted—'seven pounds! Oh, to think of mother, how delighted she will be! Why, this will pay all, and buy I can't tell what beside. Oh how happy I am! And what is this?' she continued, as she took from the other end a roll of soft paper. 'Why, these must be bank-notes, like that mis'ess gave change for once: why, they must be worth I can't tell how much. Here are one, two, three, four of them, and that one mis'ess got was worth five pounds itself. What shall we do with so much money? I'll read what's on these notes, however.' So, approaching a lamp just inside the gate, she with some difficulty deciphered the amounts of the notes, of which two were for fifty pounds, the other two respectively for five-and-twenty. 'It's quite a fortune,' she murmured in a low, reverential tone, as she tried to grasp the idea of so many pounds. 'What a happy thing for me, and how sad for the person who lost it!' Here the current of Bessie's rapturous thoughts received a sudden check; the smile faded from her lips, and she remained silently looking on the pretty purse with a perplexity amounting to distress. 'Oh me, but it is not mine!' she continued, her thoughts finding vent in a half-articulate form. 'This belongs to somebody, who is as sorry to lose it as I am pleased to find it. Oh, what must I do? I wish I had never seen it. Must I give it up just when we want it so? And then it was lying in my way, and nobody near who could have dropped it.' Poor Bessie! the struggle between conscience and want was very severe. She tried hard for a little while to convince herself that she had a right to what she found on a highway, but her principles were too strong to allow of such self-deception; and besides, in testing the matter by the golden rule, she felt that if she had dropped her two shillings on the previous night, she should have been very indignant with any finder claiming a right to them. 'No, I have no business with it indeed,' she murmured, as the tears of disappointment started to her eyes. 'But, however, surely I may keep just one or two of these pounds?—the person who lost this must be very rich, and would never miss them; surely I may have just two pounds for my finding it, and that would put poor mother out of her trouble?' Just at this moment these words, which she had lately heard, darted into her mind like a gleam of light, 'Thou, God, seest me!' 'Oh, what am I thinking of?' she exclaimed, frightened by her own thoughts: 'isn't it all just one as stealing? Let me put this out of my sight as soon as I can, lest I should be too much tempted: I won't keep it an hour.' So, resolutely concealing the temptation, Bessie set off at her quickest pace to the police-station, where she resolved to deposit the money immediately, for the twofold purpose of securing herself against temptation, and of affording the owner the best opportunity for recovering the lost property. When she told her errand to the officer at the station, he looked at her from head to foot with some surprise.

'So you didn't think of keeping it yourself?' he asked as he took the purse.

'Yes, sir, I did for a minute, for we want it bad enough,' replied Bessie with an ingenuous blush; 'but I was kept from it, thank God! There's a deal of money there, sir; will you please to count it, that you may know, when it's owned, that I took none?'

The officer counted it accordingly, and gave her a receipt for the amount, taking down her address at the same time, which she thought nothing about; then, with a thankful, happy heart, and clear conscience, she hastened home.

Frequently, during the labours of the next day, Bessie wondered whether the owner of the purse had regained it, and pleased herself in imagining the pleasure its recovery must have caused. Then her thoughts sadly turned to her poor mother, and she would speculate on the possibility of her receiving a reward. Some one she knew had been rewarded with ten shillings for finding a five-pound note; perhaps she might have a pound given her. However, she sedulously endeavoured to withdraw her thoughts from the subject, and occupied them in the attempt to devise some means of earning a little money in the family somehow, to carry them through this terrible crisis. So passed Monday, and Tuesday was passing in a similar manner. Bessie was busily washing her kitchen floor—talking to amuse the baby, who was tied on a chair in one corner of it, and thinking over a brilliant plan which had just occurred to her, of proposing one of her brothers as errand-boy to the grocer round the corner, when her mistress looked in, and sharply said some one wanted to speak to her. In great haste and surprise Bessie started up, and as quickly as possible wiped her wet hands, threw off her apron, settled her gown and cap, and hurried into the shop, where she found a middle-aged gentleman, of very pleasant demeanour, leaning carelessly against the counter. He turned as she entered, and advanced a step as she curtsied and looked, as if to inquire the object of his visit.

'Your name is Elizabeth Abbott?' he asked: 'is it not?'

'Yes, sir,' was Bessie's reply.

'You found a purse on Sunday night, I believe?'

'Yes, sir,' she replied, colouring as she spoke. 'Did it belong to you, sir? Did you get it? I hope it was all right, sir! I got a note of the money at the police,' continued Bessie, speaking rapidly, and as if half-frightened; for just then she only remembered the possibility of some money being missing, which might be demanded of her.

'Oh yes, all was right,' returned the gentleman smiling. 'I only came to see what made you return my purse so honestly and quickly. Were you not in want of money?'

'Oh, indeed, sir, yes!' she emphatically replied, as tears filled her eyes; 'but that money was not ours.'

'Perhaps you were afraid to keep it, lest it should be discovered?' continued her interrogator, looking earnestly at her, as a deep crimson flush rose even to her forehead.

She raised her eyes to his boldly, though modestly, as she answered, in all the firmness of truth, 'Sir, I never thought of that. But I would not be so miserable as theft would make me for as much again as is in your purse, sir!'

'That is well, that is well,' quietly replied the gentleman with a satisfied smile. 'Now you say you want money very much: I came here to offer you a reward for the return of my purse. How much would you wish me to give you?'

'Oh, sir!' exclaimed poor Bessie in a transport of delight, clasping her hands—'oh, thank you! thank you! Two pounds, sir, if you could be so kind, would make us all happy again!'

'It would not be buying happiness very dearly,' answered the stranger; 'but let me hear what you would do with the two pounds.'

Accordingly, Bessie related her simple little history

as the reader knows it. At its conclusion, her attentive listener smiled kindly. 'You are a good girl, Bessie,' he said. 'Well, the reward I shall give you is twenty pounds instead of two. I determined upon this if I were satisfied with your answers.'

Bessie was speechless in grateful astonishment.

'Yes, it is a little fortune for you,' said the gentleman, answering her look. 'You will of course relieve your mother from her trouble, and you had better put the rest into the savings' bank, and try to add a little to it, as a provision in case of need.' So saying, the gentleman produced the identical beaded purse, and counted twenty sovereigns into Bessie's hand, who could only look her thanks; and then he went, and Bessie hurried up to her little room to give vent to her grateful happiness, thinking how different would have been her feelings had she otherwise acted.

I need not make my story longer by describing the joy excited by her next visit to her home—how the debt was paid—and how one pound more was devoted to the purchase of sundry articles of comfort and decency (amongst which Bessie's bonnet was not forgotten)—and how the remaining pounds were safely deposited. But I must not omit to add, that the gentleman whose acquaintance Bessie had so happily made, did not forget her. Though his residence was many miles distant from hers, she was shortly afterwards taken into his family as nurse, which post she filled in comfort and respectability for many years, carefully impressing upon the minds of her young charges the same principles which governed her own.

LONDON MORNING NEWSPAPERS.

WITH the exception, perhaps, of the mysterious regions of the theatrical *coulisse*, there are no establishments the secret working of which is less known to the general mass of the public than that of those great collectors and condensers of political intelligence—those extraordinary machines which are the contemporary historians of the world—the London Morning Newspapers. With almost every other grand branch of national industry we are more or less acquainted. Most people have a notion of the operations of the blast furnace or the power-loom: most people have picked up some smattering of the mode in which cottons are spun at Manchester, and razors ground at Sheffield. Little treatises devoted to descriptions of branches of national industry are frequently issued from the press: the coarse raw material is traced through its every successive stage until it arrives at the consummation of a costly and finished fabric. We may read or see how the lump of ore becomes a legion of shining and delicate needles—how certain constituent mineral masses are fused and wrought until the glittering chandelier or the wonder-working lens is placed before us. We know how rags may become paper, and the forest a ship. Still, there is a peculiar species of industry of which the public knows little—one requiring for its successful prosecution a more peculiar union of elements than is demanded by any other pursuit—a branch of industry demanding the combined and constant application of highly-skilled and intelligent manual labour—of vast capital—of a high degree of enterprise and worldly shrewdness—and, more than all, of great, and keen, and cultivated, and flexible intellectual power, constantly applicable to the discussion of almost every question—moral, social, political, and literary—which can spring up into importance amid the daily and hourly fluctuations not only of the public opinion of Britain, but of that of the civilised world. Such a union of qualities and possessions must be brought together by any one who thinks of triumphantly establishing, or successfully carrying on, a London morning journal.

As, then, we believe that the notions popularly entertained of the means whereby the news of the world is every morning served up to us with our hot coffee and rolls are somewhat vague, we propose to devote this

paper to a sketch of the intellectual and material engine to which society and civilisation owe so much; and after some pondering as to the simplest and most comprehensive course to be adopted, we have come to the resolution—first, of enumerating and describing the several parts of the machine in detail, and then after putting them into gear, and setting the whole in motion, of directing attention to the general working, and of explaining the motive forces and the plan of operation of the entire mechanism.

All the London daily-newspaper establishments are situated either upon or close to the great artery of communication between the City and the West End. Some of those grimy-looking news-manufactories are patent to the street, others skulk in dingy and obscure alleys, as though attempting to carry out, even in their local habitations, that grand principle of the anonymous which, rightly or wrongly, is held to constitute not only the power, but the very essence and soul of English journalism.

The vast body of the employés of a London journal may be divided into six grand categories or departments, it being, however, understood that in some cases these departments blend, to a little extent, with each other, and that those individuals who, as it were, stand upon the confines, occasionally undertake somewhat mixed duties. There is, first, the important and all-supporting typographic department, numbering perhaps somewhere about sixty individuals. Then there is the commercial department, occupied in the business-conduct of the paper, in attending to the due supply of the requisite material for all the other branches, in receiving and arranging the advertisements, in managing the publication, and keeping the general accounts of the whole establishment. This department, including those more or less connected with advertising agencies, &c. may furnish employment for about a dozen of persons. We then come to the reporting establishment. Of this the principal branch is the parliamentary corps, a body averaging from twelve to sixteen members: next them may be classed the law reporters, who attend regularly in the several courts, and who may come to some half-dozen more: in the same category we may perhaps include the regular and authorised correspondents of the paper in the principal provincial towns and outposts: and our account would be manifestly incomplete did we leave out of sight the vast cloud of irregular and unengaged reporters, who supply a great portion of the every-day London news, including the proceedings at the minor courts—particularly the police-offices—the inquests, the ‘melancholy accidents,’ the ‘alarming conflagrations,’ the ‘extraordinary coincidences,’ and the like. This body of men, although few or none of its members have any real tangible footing upon the periodical press, yet play no inconsiderable part in supplying it with its miscellaneous home intelligence. They form, as our readers have no doubt divined, the often-talked-of class, called by themselves ‘general reporters’ or ‘occasional contributors,’ but known to the world as ‘penny a-liners.’ Next in the order in which we are proceeding we may reckon the important and expensive department of foreign correspondence—a department the extent and importance of which have very much increased since the commencement of the present continental disturbances. A glance at any London journal will show that, besides having a fixed correspondent in almost every European capital of importance, there is hardly a seat of war unattended by a representative of the metropolitan press. Wherever, indeed, gunpowder is fired in anger, a letter to a great English newspaper is pretty certain to pop out of the smoke. Proceeding with our list, we approach the editorial department, including not only the actual executive editors, but the corps of original writers—the mysterious authors of the ‘leaders,’ and the gentlemen whose pens, shunning politics, are devoted to the chronicling and analysis of the fine arts, the drama, and

literature. Here we tread upon somewhat slippery ground. As we have said, the principle of the anonymous is kept up with very remarkable strictness in the leading journals; and even those who are tolerably well behind the scenes in other respects, may still know little of the grand arcanum involved in the authorship of the leading articles. No doubt the paternity of some of these is tolerably well known in press circles. Sometimes the internal evidence of style or particular opinion betrays a writer: in other instances tolerable guesses and approximations are formed; but in, we should say, the great majority of cases the authorship of a leader is absolutely unknown to nineteen-twentieths of the employés of the newspaper in which it appears. In making this assertion, it is understood that we speak of the principal daily journals alone—of those the leading articles of which are not generally written by the actual acting editor, or in the establishment at all. As regards theatrical and musical critiques, there is no great secrecy observed: indeed it would be almost impossible to do so, when every second *habitué* of the theatre or the concert-room can point to the representatives of the different morning papers present. In the reviewing department the case is somewhat similar: no great attempt at secrecy is made here either. The task is frequently shared by those gentlemen of the parliamentary corps who have most literary taste and ability; and we may add, that these are also frequently deputed to attend such festivals or occurrences of public interest as demand a certain degree of descriptive and narrative talent.

We have now catalogued the five principal divisions into which the intellectual and manual labour of a morning newspaper is thrown, and we may add a sixth general department, including the class which may be described as more strictly the servants of the establishment—the day and night porters, the messengers, the couriers employed upon foreign service, and generally the host of supernumeraries who hang on the outskirts of a great newspaper establishment.

Having thus cursorily run over the different parts of the machine, we proceed more narrowly to describe their individual conformation. The typographical department comprehends, as we have said, about sixty compositors. Among their ranks are to be found the very best, the most intelligent, and the most expeditious printers in London or the world. They are paid by the piece; and a few of them earn not less than from L3 to L4 per week. From L2, 10s. to L3 is, however, we believe, the general amount of their wages. The task of a morning paper compositor commences about seven or eight o'clock in the evening, and is continued until the paper is ‘put to bed,’ as the technical phrase goes, between four and five o'clock in the morning; but occasionally his labours are even still further protracted. When an important foreign express is expected—the Overland Mail, for example—he either remains hanging about the establishment, ready at an instant's warning to commence operations upon the looked-for news, or flings himself down, all dressed, either in his lodgings or a neighbouring tavern, prepared instantly to hurry back to the office should a breathless messenger warn him that the ‘Overland is in.’ A useful peculiarity of the morning paper compositor is the extraordinary skill with which he deciphers the vile congregations of pothooks and hangers with which he is frequently called upon to deal. Imagine, for example, half-a-dozen columns of report of an important country meeting, scribbled in red-hot haste, and in pencil, by two or three reporters during their transit from Liverpool or Exeter by an express train; fancy this crumpled-up mass of half-effaced, half-unintelligible scribbling deciphered, set up in type, and corrected, within a few minutes over an hour! Yet such an exploit is by no means without a parallel in the offices of the London morning newspapers. For the rapidity with which news is set before the readers of a journal they are much indebted to the compositors.

Passing over the commercial department of a newspaper, which presents few characteristic features, we arrive at the important class of the reporters. And of these the parliamentary corps first claim our attention.

It would be unnecessary here to dilate upon the brilliant literary and legal talent which has been furnished to the country from that narrow little gallery above the Speaker's chair in the House of Commons. It is generally known that, from the days of Dr Johnson downwards, the task of reporting the debates of the legislature has furnished a means of subsistence to a class of men, from the ranks of which have sprung not a few individuals whose names are known as widely as the fame of our literature and our jurisprudence is extended; and it may be added, that the steady remuneration furnished in this way by the morning newspapers has been, and does form in many instances, the groundwork of an income extended by connection with many of the less important but not less fascinating branches of periodical and dramatic literature. The 'gallery' of course embraces men of very different calibre, and very different views and habits. With some it is the all in all, with others merely the convenient stepping-stone. A few, and only a few, of its members have little pretensions beyond those of skilful short-hand writers; but a great majority of its occupants aim higher than this—possessing as they do the intelligence of educated gentlemen, sharpened and developed by a course of training which brings them into constant communication with public men and public events; while not a few are personages of more or less literary or political celebrity, who may well aspire one day to make the speeches they now report.

The routine duty of the gallery is easily explained. Each newspaper has a regular desk, at which its representative is always seated from the opening to the rising of the House. The reporters generally succeed each other in alphabetical succession; and the period during which each remains on duty is called his 'turn.' These turns are of different lengths at different periods of the evening. Up to about 11 o'clock they are either half-hours or three-quarters. After that time they are generally either quarter-hours or twenty minutes. Every newspaper has a distinct set of rules upon the subject in question, rules which, however, are always liable to be modified, according to certain fixed principles, by the duration of the debate in the House of Lords. As soon as a 'man'—reporters are always called 'men' in gallery patois—is relieved by his next successor, he proceeds to the office to extend his notes—to write out his whack—gallery *argot* again. A full three-quarters' turn amounts, with the majority of speakers, to somewhat more than two columns of the close type used in printing parliamentary reports, the writing of which is seldom accomplished under four hours of severe labour. It not unfrequently happens, especially if both Houses be sitting—and the corps therefore distributed in equal proportions in the Lords and Commons—that time will not permit the full extension of the short-hand notes. A second turn looming a-head obliges the reporter to 'cut down' many a flower of eloquence; and on very hard-working nights there are such things as three turns, involving, as the reader will perceive, in many instances a spell of seven, eight, or nine hours of exceedingly hard and exhausting toil. These occasions, however, are comparatively rare; and taking the average amount of the session, we should say that it is somewhat less than a column per night per man. Of course the majority of speeches made in parliament bear very considerable curtailment. The ordinary rank and file of M.P.s. are merely summarised—their endless prolixity, their ten-times repeated iteration, their masses of commonplace declamation, are condensed and translated into English grammar—often a most requisite process—so that the twenty lines of what appears to the reader to be a neat little compact speech, convey, in reality, the pith and substance, well and clearly put, of half an hour or an hour's rambling tedious oration.

When, however, a reporter, unhappily for himself, falls upon one of the crack men of the house, a minister or an Opposition leader, the case is very different. The report is then almost verbatim. We say almost, because there is hardly one man in the House who does not occasionally owe something to the reporters in the way of the excision of a twice or thrice-repeated phrase, or the rounding-off of a sentence left incomplete in the heat of speaking. As may be expected, there exists a code of oratorical criticism in the gallery of an entirely technical and professional nature, and which judges of public speakers entirely in reference to the facilities which their styles afford for being reported. Perhaps a hint or two on contemporary orators regarded in this light may not be without its interest and use. Sir Robert Peel, then, is a favourite in the gallery. He is distinct and deliberate; and when he has to deal with statistics (the mortal horror of the reporters), exceedingly clear and intelligible. Moreover, Sir Robert understands the gallery. We have heard him on very important occasions absolutely dictate rather than speak. His rival, Lord John, is generally deliberate enough, but he is not always distinct, and unless he warms and rises with his subject, is very apt to be slovenly in the construction of his sentences. Sir G. Grey is an exceedingly difficult speaker to report: he is too rapid. Sir Charles Wood, again, is often verbally confused, and apt to make *lapsus lingue*, which in financial speeches are terribly embarrassing. Viscount Palmerston is a capital man for a reporter—deliberate, epigrammatically distinct, and uttering his sentences with a weighty and a telling point. Sir J. Graham is also an easily-reported speaker. Not so Mr Gladstone, who pours himself out in an unbroken, fluent, and unemphatic stream of words; uttering subtle argument faster than other speakers rattle out mere verbiage. Mr Macaulay was another dreaded orator; and for this reason, that his utterance was so rapid, as to render it exceedingly difficult to follow him; while his diction was at once so gorgeous and so epigrammatic, that the omission of a word marred a sentence. Much of the same remark applies to Mr Sheil, who, moreover, has to contend with a thickened, indistinct, and screaming utterance. Mr D'Israeli keeps a good reporter upon the full stretch, but he is not generally complained of in the gallery. As for the Upper House, Lord Stanley is perhaps the most unpopular man, using the word of course in its technical sense. He is terribly rapid and terribly good. Lord Brougham is generally more deliberate. His parenthetical sentences, however, often puzzle his recorders. Lord Aberdeen, distinct, deliberate, and pure in his style, is easily reported. The same of Lord Lyndhurst. The Marquis of Lansdowne's speeches are vastly improved by the omission of a good half of the words which they contain; and to Lord Monteagle a similar remark applies with still greater force. Earl Grey is a capital reporter's speaker—distinct, clear-headed, and correct; and so, by the way, is the young Duke of Argyle, who has made a début in public life which promises to give the reporters many an aching wrist.

On the whole, the reporters' gallery, although its occupants are occasionally very severely worked, is a pleasant and a merry place, and a great manufactory of jokes, good, bad, and indifferent. As a general rule, reporters are terribly lukewarm politicians. Probably they hear too much of all parties to like any of them; and so speeches delivered on all sides of the House are generally the objects of plenty of droll running commentary, frequently of a nature which would please the political opponents of the orator rather than himself. I may add that upwards of three-fourths of the reporters of the London daily press are either Scotch or Irish. The English are a decided minority in the gallery.

Of the law reporters little has to be said. They are frequently young barristers, who make up in this way for any deficiency of briefs with which they may be afflicted.
